German Sovereigns and kingdoms have, through the necessity of the case, submitted themselves for purposes of national policy and of general legislation to a common Imperial Government; and it would be a strange anomaly if Austria were to be dismembered immediately after the establishment of German unity. There is no reason to fear that the Council of the Empire will attempt a vexatious interference in the internal affairs of the several provinces, inasmuch as the great majority of members will be jealous of the customs and privileges of their respective constituents. With the exception of Hungary, which is no longer concerned in the discussion, no portion of the old Austrian Empire at any time enjoyed the self-government which is recognized to a certain extent under the Constitutional Monarchy. Within living memory the Ministers of an absolute Emperor encouraged the peasantry of Galicia in a murderous insurrection against the Polish gentry, who are represented by the present dissentients in the Council of the Empire. The Bohemian nobles enjoyed their share of military and civil dignities; but it never occurred to them to defend against the central despotism the ancient immunities of which they have since been so strongly encouraged. Hungary was and is a constitutional kingdom. The Western States gain in dignity as well as in opportunities of improvement by becoming portions of a great country governed on a Parliamentary system. It is only through the Council of the Empire that any of the contributory States can exercise a control over the foreign policy in which they have a deep and common interest. It now appears that, after the commencement of the war of 1870, the Government of Vienna held out to the French Emperor illusory promises of assistance. No freely elected Parliament would for a moment have countenanced a ruinous policy. At the same time Count Andrassy, as Prime Minister of Hungary, ascertained that the feeling of the Parliament and of the nation was opposed to intervention; and he has lately declared that it would have been impossible for the Crown to have opposed itself to the determination of the people. The Western half of the monarchy, including Bohemia and Galicia, is as fully entitled as Hungary to form and enforce an independent judgment on questions of national policy; and it is evident that the provincial Diets only deprive their constituents of legitimate influence when they unduly weaken the central Legislature.

THE MEMBERS FOR OXFORD.

MR. CARDWELL and Mr. HARCOURT are respectively excellent specimens of the Minister and of the member below the gangway; and when Mr. HARCOURT's turn comes for crossing the intermediate space he will have no difficulty in assuming a gracefully official demeanour. It may be inferred from the topics selected by both members for their principal speeches that the mind of the Oxford electors is at present more deeply concerned with the public-house controversy than with more abstruse matters of policy or legislation. Mr. CARDWELL defends the Licensing Bill, for which he is, in common with his colleagues, responsible, in the tone of an advocate who knows that he is not on the popular side. It is still uncertain whether the measure of last Session will be permanently successful, but there can be no doubt that it was a justifiable experiment. If the manners and customs of the bibulous classes are not too rudely disturbed by a restriction on the hours of drinking, the rest of the community will have reason to congratulate themselves on a curtailment of the time during which noise and disorder are likely to prevail in the streets. Mr. CARDWELL perhaps adopted too readily the commonplace assertion that crime and pauperism are chiefly caused by drunkenness. The frauds and thefts which mainly occupy criminal Courts have no connexion with the use of alcohol, excepting where the desire for it, as for any other form of indulgence, may constitute a temptation to dishonesty. Crimes of violence are often the result of drunkenness, though it may be doubted whether men of peaceable dispositions are in the habit, even when they have exceeded in liquor, of assaulting their neighbours or beating their wives. In wine, and by analogy in beer and gin, there is, according to the proverb, truth; or, in other words, intoxication produces not an opposite, but a caricature, of the ordinary disposition. Neapolitans and Sicilians, though they seldom drink to excess, rob and stab friends or strangers with a free which is unknown in England. The ably amiable men are and assembly has when they are, or equally [illegible] the *Times*. It for a [illegible]

[illegible] when they are excited. Both classes frequently waste or drink the incomes which they ought to employ in the maintenance of their families; and if a law which slightly restrains the mischief produces no intolerable annoyance to well-disposed persons, it seems, notwithstanding the liberal doctrines of Mr. MILL and Mr. HARCOURT, to fall within the province of allowable legislation. Mr. CARDWELL's statement that it was necessary to do something to satisfy general opinion belongs to a kind of apology which ought to be vigilantly watched and suspected; but Mr. HARCOURT's general propositions have still less practical value. If it were the fact that half the crime of the country could be prevented by shutting public-houses ten minutes earlier, Mr. HARCOURT would in consistency be compelled to protest against the restriction; but he would scarcely persuade Parliament or the country to prefer an infinitesimal right of drinking to a great public benefit.

In his more ambitious vindication of freedom in drinking Mr. HARCOURT directly traversed the doctrines which have lately been propounded in a powerful series of Essays on Liberty, Equality, and Fraternity. As Mr. HARCOURT neatly says, liberty does not consist in making others do what you think right; but liberty is a negative phrase, and public expediency is the primary object of legislation. Long experience indeed has shown that it is not desirable to interfere unnecessarily with *private* judgment, or even with private caprice; but minor limitations of absolute liberty are in many instances tolerated where restrictions tend to the comfort or advantage of the general community. The special criticisms on the unintelligible clauses of the Act which relate to the valuation of public houses have, although they are perfectly well founded, nothing to do with the principle of restriction. It is not in the nature of a modern Act of Parliament, and more especially of a Ministerial Bill, to be exempt from ambiguity. Mr. HARCOURT has reason to complain of the clamour and hurry which deprived his objections of their proper weight during the passage of the Bill through the House of Commons. His appeal to the Nonconformists against the absurd Permissive Bill was as unanswerable as it will be inoperative. A Permissive Bill in the days when, as Mr. HARCOURT said, schism was thought worse than beer, would have closed nearly all the Dissenting chapels in the country. Logic is unluckily the least effective of weapons in political controversy. The Nonconformists would content themselves with the reply that beer is a bad thing which ought to be suppressed, and that Dissent is a good thing which ought to be tolerated and encouraged; nor would they forget that, if they were once in a minority, they could now by their numbers, their organization, and their political alliances, apply permissive legislation to their own purposes in many parts of the country. Mr. HARCOURT's protest on behalf of private liberty, if it is not marked with sufficient qualifications, nevertheless deserves recognition as a defence of a partially unpopular principle. Contemporary cant is almost universally enlisted on the side of paternal and officious government; and it is well that the old English doctrine should be occasionally asserted.

On political questions Mr. CARDWELL was at the meeting in the Town Hall judiciously brief. Of the Ballot Bill, which he supported for three years, after opposing it for seventeen years, he safely remarked that it had tended to promote order and quiet at elections. The improvement which has lately occurred is due much less to the Ballot than to the abolition of the public nominations, which had become useless and mischievous through the excesses of the rabble. It is true that the process by which secret voting is conducted tends in itself to diminish disorder, though the same result might have been produced under the former system by a few simple changes in the machinery of elections. Mr. CARDWELL is well aware that the maintenance of order has but a slight and accidental connexion with the real objects of a representative system. As long as the House of Commons exercises sovereign power, the best mode of election is that which results in the choice of the most competent members. The Ballot destroys or diminishes both legitimate and illegitimate influence; and experience will show whether the balance of results is advantageous or pernicious. A revolutionary majority would be a [illegible] greater evil than a score of riotous elections. It is yet more, wherefore [illegible] Mr. CARDWELL is [illegible] or defenders of society against [illegible] nor into his [illegible] But the want of [illegible]

CARDWELL has never been hasty to adopt the new or to abandon the old. As an administrator he has displayed remarkable boldness; but as a politician he has always, since he joined the Liberal party, kept himself exactly abreast of its leaders for the time. There is no reason to suppose that Lord PALMERSTON was too stationary to command his confidence; and he has not yet found it impracticable to keep pace with Mr. GLADSTONE. Even if he had not been restrained by official reserve, he would probably not have been inclined to indulge in the generalities which render Mr. HARCOURT's speech at the Town Hall more exciting than his own. At the Druids' dinner Mr. CARDWELL must have listened with mixed feelings of envy and alarm to his comparatively irresponsible colleague.

In an eloquent contrast of the character and history of the Conservative and Liberal parties Mr. HARCOURT plainly indicated his own disinclination to tamper rashly with existing institutions. The great merit which, with considerable though one-sided truth, he attributes to Liberal policy is that, according to his views, it has resulted in the present condition of affairs. It has, in Mr. HARCOURT's opinion, saved the Throne, preserved the aristocracy from the possible consequences of their own mistakes, and greatly strengthened the Church. If these achievements are laudable and beneficial, it follows that it is not desirable to overthrow the Church, the House of Lords, or the Throne, but to preserve the admirable results of Liberal legislation. Mr. HARCOURT seems to have no sympathy with "gentlemen who go up and down the country "prescribing all sorts of nostrums of a some-"what desperate character for the recovery of the Liberal party." He also feels a great dislike for the un-English term "programme," and for the meddling policy which it commonly indicates. Of course Mr. HARCOURT holds that the Liberal party has still much to do; but probably he is disposed to let the great institutions of the country alone for the present. The evil which he seems chiefly to apprehend is democratic despotism, of which he perhaps thinks that some symptoms have appeared in Permissive Bills and Licensing Bills. It may be true that the Liberal party, or rather the moderate section of its members, will hereafter offer the most effective resistance to the tyranny of numbers; but the first precaution which it must take is to withhold any further addition to the power of the democracy. Mr. GLADSTONE has lately relegated the extension of the county franchise to the distant day at which the public mind will be prepared to adopt it. Before that date arrives, the nominal distinctions of parties will perhaps have been readjusted. If any of Mr. HARCOURT's constituents thought him too cautious at the Town Hall, they will have been reassured by his speech to the Druids. Not content with adopting the popular commonplaces of the day about Land laws and Game-laws, Mr. HARCOURT proposed the abolition of the Income-tax; and he announced, in the presence of a principal member of the Cabinet, his conviction that the House of Commons would reject the measure on Irish Education which Mr. GLADSTONE is expected to propose. The Oxford tradesmen who really desire the abolition of Schedule D, and the positive or relative increase of the tax upon property, probably failed to observe that Mr. HARCOURT is with good reason impressed rather by the hardships suffered by the owners of small fixed incomes than by the injustice of a contribution to the revenue from trade profits. If Mr. HARCOURT's conjectures as to the feeling of the House of Commons are well founded, Mr. CARDWELL will probably be able at the next Druidical anniversary to speak in freedom from the restraints of office.

GERMANY.

THERE was a time when the controversy as to the conduct of Austria during the French war might have caused a serious coolness between the Courts of Vienna and Berlin. As it is, the leaders of Germany can afford to be perfectly calm and even magnanimous towards Austria. What does it matter, they say, whether Austria did or did not wish to go to war with us in order to help France? If Austrian interests imperatively demanded such a policy to be followed, we cannot blame Austria for having been willing to do what seemed best for her[illegible] her true interests require an [illegible]ures herself our very [illegible]r own terms as [illegible]line[illegible]

Austria are perfectly different from those which used to obtain between the rival and equal powers of Austria and Prussia. These disclosures have no more than an historical interest, and that of a very slight kind. The Duke of GRAMONT was examined before the Parliamentary Commission, and he then said that he could not in honour reveal what had passed between the French and foreign Cabinets, as it would make it impossible for foreign statesmen to deal frankly with the French Foreign Office if despatches intended to be confidential were published by French Ministers after they had left office. The Commission acquiesced in this, and the Duke was left perfectly free to keep his secrets. But M. THIERS, in giving his evidence, blamed the Imperial Government for going to war without allies; and suddenly the Duke of GRAMONT discovered that this statement absolved him from all his solemn obligations to secrecy, and he felt himself at liberty to give to the world the most confidential despatches of the Cabinet of Vienna. So far as history goes, the course taken by the Duke is chiefly significant as adding one more illustration of the unfitness of the higher officials employed by the Empire towards its close for their places. What his disclosures come to is that, after war had been declared, Count BEUST informed him that Austria regarded the cause of France as her own, and would contribute to the success of the French arms as much as possible. This does not at all show that France went to war with Austria as an ally, which, on the score of prudence, would have been some sort of justification of the French Ministry; it only showed that Austria would have liked to see France win, and if she had won, would have joined her in the hope of sharing the spoils. As it happened, it was not possible that Austria should help France, for a variety of reasons; because France was so quickly and so utterly crushed that Austria had no time or motive to help her, because the Hungarians and Austrian Germans declined to fight for France, because Russia forbade the intervention of Austria, and because Austria had neither men nor money for a war. Any one of these reasons was enough by itself, and every one of them has been known perfectly well for a long time. The most that can be said is that Count BEUST used language that seemed as if Austria was more ready to act in favour of France than she really was. But what M. THIERS said remains uncontested—that France went to war without allies. The Duke of GRAMONT virtually admits this, but he thinks that he avoids the reproach which this admission involves when he shows that there was one Power which, if France had been successful, would have subsequently joined her. And yet a man who can argue in this way, and violate the honour of diplomacy in order to be able to use the argument, was the Foreign Minister of France at one of the most momentous crises in the history of the nation.

Austria gives Germany no uneasiness; but Germany has an enemy who makes her very uneasy, and that is the POPE. So detestable to the POPE are the goings on of Germany, that he has almost given up execrating the Sovereign of the Subalpine Kingdom, as he calls VICTOR EMMANUEL, and keeps all his stronger phrases and his vials of fiercest wrath for the Germans. The other day the POPE had to make an Allocution, and spoke as he thought right on the occasion. The German Government has set itself in notorious and avowed opposition to him, and he naturally, and properly from his point of view, cursed it for so acting. The particular expressions of rigmarole Latin in which he flourished forth his indignation are of no importance, and Englishmen cannot pretend to sympathize with the passion and indignation which the Papal Allocution has called forth in Germany. It was quite proper to order the German representative at the Vatican to quit Rome, as it was not becoming that Herr STUMM should go in state to hear his master cursed. But the German Government has forbidden the circulation of the Allocution in many parts of Germany, and Prussian papers contravening the order not to print it have been threatened with seizure. The loyal German press is beside itself with rage, and can find no terms too hard to describe its feelings towards the POPE who has dared to be impolite towards their beloved EMPEROR and his Ministers. This seems to us in England somewhat childish. We have had our day been cursed, and excommunicated, and interdicted by the reigning Pope of the time in every form of execration known to employers of ecclesiastical Latin. But we found from practical experience that these curses did us no sort of harm. We went on our own way, did exactly as we [illegible] the Pope and his views of things human a[illegible] power of the State as we considered [illegible] we now go on quite [illegible] cursing E[illegible]

Englishmen would not in the slightest degree mind if he did. The Italians, it must be said to their credit, have acted exactly in the same way. They have been steadily cuffed for twelve or thirteen years, and have got so used to it that the POPE now directs his choicest language against those who will feel it more. The POPE must have been very much gratified by the reception which his eloquence has met with in Germany. It must have been a delight to him of quite a novel kind to find that he has enemies whom he can sting. Prince BISMARCK lately announced that the Prussian Government would not accept the doctrine of Papal Infallibility, and if his Government had got so far as that, it might have been expected to show itself indifferent to a few Latin phrases. There is no middle course open to those who find themselves cursed by the POPE. Either, when cursing, he speaks with divine authority, and then his rebukes ought to be accepted with humble contrition, or he does but utter the sentiments of an amiable but irritable Italian gentleman, and then his curses are not more worth regarding than if they came from the lips of a Roman Marquis. Unless the latter is the view of the German Government, it is wickedly misleading the multitude in not at once seeking reconciliation with the POPE by repentance. If it is the view of the German Government, it might surely let this excellent person curse Germany to his heart's content.

But Germans will of course say that it is easy for Englishmen to talk in this way, as in England power, and numbers, and wealth, and historical tradition are all on the side of Protestantism, whereas German statesmen have to deal with a nation which is divided almost equally between Protestants and Catholics. What German Liberals fear is, not that the POPE's curses can in themselves do harm, but that a very large, important, wealthy, and fanatical portion of the people of Germany will think they can do harm, and that this will cause intestine discord in Germany. Why should any one blame the POPE for exciting intestine discord in Germany? There are a certain number of Germans who look to him for spiritual guidance, and he gives it them. He, who to their minds is possessed of divine knowledge, and speaks with superhuman certainty, tells them what they ought to do and what they ought to avoid. Those who have destroyed the temporal power always say that they have left the spiritual power of the POPE untouched, and the spiritual power of the POPE means really the power of blessing the good and cursing the wicked. The POPE is using none but strictly spiritual weapons when he issues these long Latin manifestoes, and it is his business to issue them. The extinction of the temporal power is sure to make the exercise of the spiritual power more unfettered and more forcible. While the POPE was Sovereign of a petty principality, he had to be thinking how what he might say would suit Austria, which guarded him, or France, which alternately menaced and protected him. But now he has nothing to lose which sovereigns and armies can take away. The Germans who quarrel with the POPE must look their situation in the face. The POPE does not in the least care whether Herr STUMM attends his receptions or not, while to forbid the attendance of that illustrious German at the Vatican is positively all that the German Government can do to retaliate on the POPE. The Germans have to make up their minds that the POPE will go on cursing them, will curse them with increasing intensity, and will delight in finding that they are, after all, thin-skinned and wince under his chastisement. The quarrel they have taken up is not a light one, and they will have to [illegible] hard to win it. That they, and especially that Prince BISMARCK, will not flinch is tolerably certain; and the KING, [illegible]ared perhaps somewhat by the Papal Allocution, has taken [illegible]ion to intimate publicly that the removal of the Prince from the Presidency of the Cabinet does not imply any severance of policy or opinion between the Sovereign and his great [illegible]ister. It is difficult not to suspect that a somewhat [illegible]ficial importance has been given to the POPE's language in [illegible] to sustain the ardour and harden the temper of the [illegible]rial majorities in the Parliaments both of Prussia [illegible]ermany.

POLITICAL CHARACTERISTICS OF THE FRENCH RIGHT.

[illegible]ve party in the French Assembly has an [illegible] and occasionally an equally able critic in [illegible]ident of the *Times*. This [illegible] has [illegible] a text for a [illegible] changes which he has had to record during the last twelve months. His conclusion is that, while the habit of politics, the faculty of organization, and obedience to discipline were superior with the Left, the Right has throughout shown a more disinterested patriotism and greater purity of motive. The Left never gets much praise from the *Times*' Correspondent. Until lately it was the fashion to attribute the misfortunes of France to the want on the part of the Left of those very qualities which, now that they are forthcoming, are put aside as matters of secondary value. Parliamentary government, it was said, could never be respected so long as Radical deputies stormed and foamed at their opponents whenever anything was said which they disliked. During the Session of 1872 the Left showed an increasing disposition to take this lesson to heart. M. GAMBETTA rarely spoke, even when provoked to do so by all the taunts the Right could invent; and the silence of the leader was diligently, and, on the whole, successfully, copied by the party. If this self-control had been displayed by the Right, it would probably have been quoted as an instance of true devotion to the interests of France. It is only when it is found among the Left that it sinks to the level of a party manœuvre. Even the divisions of the Right are only virtues in the wrong place. They have their source in "the mistaken notion that "the highest interests of the country are bound up in those of "rival dynasties." Politically a blunder of this sort is scarcely to be distinguished from a crime. The Right may think they are doing France a service by making, so far as they have the power, every Government impossible save one in which the Count of CHAMBORD or the Count of PARIS holds the chief place. They may be acting in perfect good faith, but good faith unaccompanied by good sense is worthless for any practical purpose. In itself it matters nothing whether the advocates of Divine Right embody their fetish in a Monarchy or a Republic. At present, however, the monarchical doctrinaire is the more mischievous of the two, because it is his turn to give way. If France were as well disposed towards a Restoration as it is towards a Republic, the Republicans would deserve equal blame if they clung to a mistaken notion that the highest interests of the country are bound up in those of a particular form of government. It is not possible, however, to withhold merited censure from one party because another would probably be equally unreasonable if it had the chance. Republicanism is in the ascendant in France, and those who allow political superstition to blind their eyes to this fact are at best virtuous nuisances. Historians may hereafter do justice to their good intentions; contemporary critics can only quote them as the latest example of what good intentions are worth.

The *Times*' Correspondent sees a brighter future opening out before the Right. He admits that they have certain "exclusive "prejudices" which they will have to get rid of. But he holds that it is "with them that the influences lie which are "calculated to bring about the moral regeneration of France." If by this is meant that the French Conservatives are good husbands and fathers, that they respect family ties, and hold unimpeachably sound opinions as to the rights of property, the testimony may gladly be accepted. Unfortunately, however, the recent experience of the country shows that these admirable qualities, so long as they stand alone, are a benefit only to their possessors. The work of a political party requires political capacity. In their own neighbourhoods the deputies of the Right may be so many centres of moral regeneration. But at Versailles political regeneration is wanted as well, and for this end wisdom is as essential as virtue. What evidence of wisdom, even of inchoate wisdom, have the Right given? The *Times*' Correspondent has nothing to say for their behaviour down to the beginning of the autumn recess. He particularly singles out their interview with M. THIERS on the 20th of June as an amazing exhibition of human folly. Even during the recess they showed no signs of improvement; on the contrary, they frightened the moderate Liberal public by their theological extravagances. But they had the wit to see that M. GAMBETTA's speech at Grenoble had alarmed the moderate Liberal public yet more, and thereupon to assume the character of defenders of society against a universal and implacable foe. If they really believed their own story, they were justified no doubt in taking this course. But the want of discrimination which can see no difference between a Radical of M. GAMBETTA's type and a Paris Communist is fatal to their pretensions as enlightened politicians. If they did not believe their own story, if they merely grouped Radicals and Communists together for the sake of involving them in a

common shame, their action was shortsighted as well as immoral. They ought to have known that the Republican party in France is too strong to be put down by transparent misrepresentations, and that an appeal to a cosmopolitan conservatism could only throw suspicion on their own patriotism. Nor is there any more trace of political acumen in the conduct of the Right towards the PRESIDENT. They may have sincerely believed that M. THIERS was only a Communist in Conservative clothing, in which case they were honest and foolish: or they may have hoped to bring him to their side by threats of withdrawing their confidence, in which case they were dishonest and foolish. But on neither hypothesis were they anything but foolish. The real needs of France remain what they were, and foremost among them comes the need that the Government should secure the support of the largest attainable number of Frenchmen. If M. THIERS were to become simply President of the Right—which is what the demand that he should break with the Radicals really amounts to—the main reason for conferring the office upon him would no longer operate. His object is to find up a Government in which Republican forms shall embody Conservative realities. If the Right had sufficient sense to take in this object, it is probable that they would, as a body, be willing to co-operate in bringing it to pass. The number of deputies who have either a Legitimist or an Orleanist Restoration much at heart is probably exceedingly small. But they are not enlightened enough to understand, that to saddle Conservatism with the maintenance of a throne in addition to the other burdens which it has to sustain is to run a terrible risk of overtaxing its strength. They have not yet shaken off the notion that a throne is an institution which would, under all circumstances, defend its adherents, instead of being an institution which its adherents might have to defend. Or, if they have shaken off this idea, their conduct only becomes more unintelligible. What can the French Conservatives expect to gain by postponing the definitive constitution of the Republic until some unnamed day, when they will no longer be able to superintend the process? If, as the *Times* Correspondent tells us, the essential scope of M. THIERS's programme is "very "similar to what which the Conservatives desire," why have they put so many obstacles in the way of its execution? Men who do not know their own friends, and quarrel with a Parliament which is doing their work for them far more effectually than they could possibly do it themselves, because he bestows a few civilities on the opposite party, may have excellent hearts, but they cannot have strong heads.

It may be that the silence and secrecy of the Thirty and their Sub-Committees indicate that some sense of this truth is at last dawning upon them. But it is by no means certain that there is still time for their eyes to be opened to any purpose. Supposing that they now make up their minds to work heartily with M. THIERS, their sudden conversion may alarm the Left, and lead it to offer a vigorous opposition to changes in which a little while back it would, to say the least, have acquiesced. The object of the Left is to get the Republic well under weigh, and to secure this they would admit into it a stronger element of Conservatism than they would be disposed to introduce if they were framing a Constitution for themselves. But if the Right, after rejecting M. THIERS's proposals in the first instance, are by and by seen to be impressed with a sudden conviction of their merit, it will not be an unnatural inference that M. THIERS has made some secret promise inconsistent with his public declarations. The Left will then subject every proposal he may make to the strictest scrutiny, and it will be strange if under this ordeal some defects are not perceived which will justify the Left, at all events in their own opinion, in refusing to accept a Republic from the making of which Republicans have been carefully excluded. To have been obstinate when reason counselled pliability, and to be pliable when events have already stereotyped the results of previous obstinacy, may be the crowning title of the Right to the possession of political foresight.

INTERNATIONAL EXHIBITIONS.

DR. FORBES WATSON appears to be very much exercised in mind by the declining popularity of International Exhibitions, and he has endeavoured in a couple of letters to the *Times* to explain the reasons why, in his opinion, these Exhibitions have fallen in public estimation, and the means by which they may be restored to their former glorious position. Dr. WATSON's letters are very long, and it is only by quotation that we can hope to give any idea of their profoundly philosophical character, and the sesquipedalian dignity of the language in which they are written. Dr. WATSON fears that there is no use in shutting our eyes to the fact "that the "enthusiastic expectations of 1851 have given place to a grow- "ing feeling of indifference, mingled with impatience, on the "part of the bulk of practical men, and to a feeling of scepti- "cism and disappointment on the part of a great number of "thinking men." The usefulness of Exhibitions as public institutions is questioned, and even their "efficiency in "furthering private interests is strongly doubted, some- "times denied." Dr. WATSON assures us that, in the latter respect at least, great injustice is done to the South Kensington Exhibitions. These Exhibitions, he says, "certainly promote a good number of individual interests." This is, no doubt, very satisfactory, especially to the individuals whose interests are promoted; but at the same time there is also perhaps a certain amount of truth in Dr. WATSON'S deep reflection that "a public institution can "live only in virtue of a manifest, incontrovertable, and "tangible public utility." Dr. WATSON pathetically contrasts the brilliant prospects of the Exhibition of 1851, which "was "to be instrumental in bringing about a political and social "millennium," with the degradation of more recent Exhibitions, at which even small retail tradesmen turn up their noses. Dr. WATSON has heard it said that the Exhibitions of the present day are good only as "a means of advertise- "ment," and not good for much even from that low point of view. He asks himself how this decline and fall of International Exhibitions has come to pass, and after deep cogitation he arrives at the conclusion that the success of the first Exhibitions was due "to the operation of "causes which are becoming less and less operative." When causes cease to operate they usually become less operative; but why did the causes in this case become inoperative? Dr. WATSON appears to be of opinion that International Exhibitions have gone down in the world because their success in the first instance was too complete. This is perhaps only another way of saying that their usefulness is exhausted, and, if so, we are disposed to take the same view. "Many objects," says the Doctor, "which in 1851 were considered as being capable of "realization only by the means of great periodic public effort, "occurring at considerable intervals of time, are now perma- "nently supplied by private trade, and have passed into the "daily practice of international commerce"; in other words, shopkeepers can now manage their own affairs very well without the assistance of the Royal Family, Cabinet Ministers, and all sorts of distinguished people, to say nothing of COLE C.B.

We gather from Dr. WATSON'S letters that "the doubts "which are now beginning to be entertained by the public "have long weighed down the minds of the organizers of "Exhibitions," and especially of the "French Commissioners "of the Paris Exhibition of 1867." We can hardly say that we are surprised at this. The Exhibition of 1867 was intended, we believe, to be a great festival of fraternity. The Prussians, to show their love for the French, sent them the great Krupp gun to look at, and King WILLIAM and Count MOLTKE, with their staff, being on a visit to the EMPEROR, took the opportunity of inspecting the fortifications of Paris and the adjoining country. Three years later the EMPEROR and Count MOLTKE paid another visit to the French capital, and the Parisians then learned that the big Krupp gun had not been melted down into reaping hooks and ploughshares. Dr. WATSON professes to believe that "Exhibitions have power "fully contributed to knit closer the bonds of internation- "relations"; and when he wrote this he was perhaps thinking of the bonds of the war indemnity in which France is bound to Germany. The Great Exhibition of 1851 was quickly followed by the Russian and Italian wars; and although the United States have always been amply represented in our Exhibitions, it has not the less been necessary to pay three millions to that country in order, accord- ing to the theory of the English Government, to avoid hostilities. It would be as absurd to deny the useful results of the Exhibition of 1851 as to argue that it has been the instrument of regenerating humanity and establishing a millennium of love and peace. In their own way International Exhibitions are no doubt sufficiently amusing and instructive. They afford an innocent and agreeable lounge for people who have nothing to do but only to indulge their curiosity, and to pass away an hour or two; while those who go for the purpose of studying the productions of a particular craft or country can [illegible] carry away a considerable amount of valuable information. An International Exhibition is only a grand [illegible] bazaar. Call it by its right name and the

tion to it. What has disgusted people with these undertakings is the absurd pretensions advanced on their behalf, and the monstrous puffery and charlatanism with which they are associated. Every grocer's or silkmercer's shop is practically an International Exhibition—that is to say, wares from all parts of the world are collected there for exhibition and sale. Ever since 1851 the shopkeeping element in the International Exhibitions has been acquiring greater prominence; and the sort of Exhibition which is now held year after year at South Kensington is simply a congeries of shops. No attempt is made to limit the show to productions of genuine artistic merit. The shopkeepers who think it worth while to become exhibitors simply empty the contents of their windows into the stalls allotted to them. To the Exhibition of 1871 the Indian Government contributed a considerable quantity of articles of native manufacture. These articles when first displayed were labelled with the prices at which they were sold in India, but soon afterwards some private dealers began to sell wares of a similar kind, and the prices on the exhibited articles had to be removed in order that the dealers might be under no restraint in charging what they pleased. This is only one illustration out of many which might be given of the spirit in which these Exhibitions have come to be managed. It may be suggested that, if the great object is to provide a profitable market for certain classes of shopkeepers, the shopkeepers may be trusted to understand their own interests, and to push their trade without the intervention of distinguished Royal Commissioners, who might be much more usefully and honourably employed in other ways. On the other hand, the establishment of a popular show might advantageously be left to professional showmen. The annual Exhibitions at South Kensington have declined in two ways; the public and exhibitors have both turned away from them. Manufacturers of a high class resent the company in which they find themselves at these promiscuous gatherings, and prefer to appeal to the public in their own way. The system of awards has collapsed from natural causes, and there is now nothing to tempt exhibitors but the chance of selling their goods.

Dr. WATSON is of opinion that the future success of International Exhibitions depends on "the reconstruction in the "public mind of a clear and high idea of the magnitude and "importance of the functions which Exhibitions may be made "to fulfil." It would be more reasonable, perhaps, to say that the success of these Exhibitions depends on the managers forming a clear and high idea of the principles by which they should be guided. It is not the business of Royal Commissioners to identify themselves with shopkeeping interests, or to enter into competition with tea-gardens and Crystal Palaces. The manufacturers of the ordinary articles of commerce are by no means such a morbidly shy and retiring class that they need to be coaxed out of their modest seclusion by public functionaries, and entreated to allow their goods to be exhibited and their names to be advertised. If they have wares to sell, they will probably find some means of letting the public know it. The Commissioners have undoubtedly committed a great mistake in allowing the shopkeeping element to acquire such a predominance in their shows, and, on the other hand, they have stooped too low for the sake of gratifying the tastes of vulgar holiday-makers. The only way in which these displays can be raised to a proper position is by rigidly eschewing shopkeeping and claptrap, and confining the Exhibitions to articles of real artistic excellence, which should be shown for their own sake, and not with a view to sale. It is true that an Exhibition of this kind might prove to be neither very popular nor very remunerative, but it would be attended with more solid advantages; it would encourage art and educate the public taste. There is no reason, as far as we can see, why distinguished noblemen and gentlemen should be appointed by the QUEEN to perform functions which are already adequately provided for in the ordinary course of trade. The shopkeeping and showman parts of the scheme, if worth doing at all, may be safely left to private enterprise. The mission of the Royal Commissioners, if they have a mission, surely lies in a more elevated region. Mr. FORBES WATSON hints at a grand scheme of Trade and Technical Museums — a museum devoted to cotton machinery and products in Manchester; another to wool in Leeds or Bradford; another to metal work at Birmingham, and so on; and permanent systematic collections of [illegible] would undoubtedly be more useful than temporary shows got up chiefly with an eye to popular effect. There is room for art and of special ingenuity constitute, however, merely by the objects of such Exhibitions as those at South [illegible] apart from the general popularity of International Exhibitions, that which is to be held this year at Vienna seems to have every prospect of being successful. Vienna is a pleasant city, out of the track of the ordinary tourist, and not yet hackneyed; and there is much to excite interest both in the social and political circumstances of Austria. Among ourselves, however, Exhibitions of this kind have evidently had their day.

SPAIN.

THE Spanish factions take up the part of rebellion one after the other like glee-singers, except when occasionally they all join in one discordant chorus. If rumour may be trusted, it is now the turn of the supporters of Don ALFONSO to relieve the Carlists who still utter insurrectionary murmurs in the North, and the irreconcilable Republicans who have recently been silenced. The report is probably calumnious, for the Alfonsists belong to a class which has something to lose, and to them civil war would be a more serious undertaking than to the mountaineers of Galicia, or to the bloodthirsty rabble of the great towns. If it is true that the KING regards their designs with uneasiness, it may be conjectured that he fears their perseverance and their organization rather than any immediate attempt at violence. If indeed the chiefs of the army incline to the cause of the banished dynasty, the present system may become untenable; but for the moment the PRIME MINISTER appears to be in a stronger position than any of his predecessors since the death of PRIM. It is true that the life of any political man who has rendered service to Spain is in the highest degree precarious. The assassins who haunt some parts of Madrid lately fired on ZORRILLA's carriage and murdered one of his servants. If the criminals had been arrested and punished, they would probably have been accompanied by the same sympathy which attends Manchester martyrs; but in Madrid patriots of their order incur little risk of martyrdom. The murderers of PRIM and the would-be murderers of the KING are still unpunished and undiscovered: and the practice of assassination naturally flourishes. If ZORRILLA escapes the danger which is a condition of power in Spain, he may perhaps abate the political anarchy which has long prevailed. He has already rendered good service to the KING and country by retaining office longer than any other Minister during the present reign. It appears that he still commands a large majority in the Cortes; and he has at last introduced a remarkable innovation by proposing a measure of undoubted expediency and justice. Since the last revolution, and during the greater part of the reign of Queen ISABELLA, the military and civil adventurers who have at different times succeeded to power have been almost exclusively occupied with efforts to maintain their own supremacy; and O'DONNELL, who tried to divert popular attention to foreign policy, only succeeded in involving the country in two or three unnecessary and unprofitable wars. PRIM, after he had risen to the head of affairs, displayed both energy and patriotism; but he was during his tenure of office unavoidably engrossed in the difficult task of founding a constitution and a dynasty. ZORRILLA has now determined to concentrate his exertions on the correction of a great and acknowledged abuse.

The Progressist party, which possesses a large majority in the Cortes, has cordially approved ZORRILLA's proposal for the abolition of slavery in Porto Rico, and of course it may be expected that all sections of the Opposition will unite in condemning emancipation. The principle, indeed, has long since been formally approved, but no machinery has been provided for the accomplishment of the scheme. It is evident that ZORRILLA is thought, both by friends and enemies, to display extraordinary boldness in giving practical effect to former legislation. The Bill which he has introduced provides for the complete abolition of slavery within a year, and for compensation to the owners. From the rhetorical preamble it might be supposed that the emancipation of slaves was a Spanish discovery of the present day, which had never been anticipated by less civilized and less generous nations; but if fine words render sound measures more acceptable to the Cortes and the people, it would be hypercritical to object to sonorous recitals. In the exercise of national magnanimity the slaves are to be made free, and the objects of legislative beneficence will not inquire too curiously into the originality of the measure. To foreigners it seems that the conditions of emancipation in Porto Rico are unusually favourable. The white or coloured free population numbers half a million, and there are only 25,000 slaves, occupied for the most part in domestic service. There

is consequently no risk of disturbing the cultivation of the land; and it may be presumed that the dense population of the island affords sufficient security against the mischievous practice of squatting. Employers will hereafter be compelled to pay wages for the services which have hitherto been rendered by slaves; but the expense will be wholly or partly covered by the compensation provided in the Bill. When the slaves were emancipated in the English colonies forty years ago, the large sum which was voted by Parliament proved insufficient to compensate the planters for the impossibility of obtaining labour to cultivate their estates. If the liberated slaves would have worked for wages as well as they had worked under compulsion, justice and philanthropy would have been combined with economical advantage. The inconvenience of emancipating in Porto Rico one negro among twenty free men can scarcely be intolerable. It may be inferred from the smallness of the slave population that few importations have taken place in recent times. The slave trade seems for some unknown reason to have been exclusively directed to Cuba, where the negroes are consequently less generally civilized than in Porto Rico, especially as a larger proportion in Cuba is employed in field labour.

ZORRILLA thinks it prudent to consult the national susceptibility by confining the project of abolition to the colony in which there is no civil disturbance. It might be difficult to invent plausible arguments against the emancipation of slaves in Porto Rico; but it is evident to all parties that the present measure must hereafter be extended to the more important colony. The owners of slaves and of other property in Cuba accordingly offer the most active resistance to the Ministerial measure; and the political factions which support them endeavour to excite popular prejudice by attributing ZORRILLA'S proposal to foreign dictation. The PRESIDENT of the United States in his recent Message gave colour to the suggestion that emancipation is promoted in deference to American opinion; nor is it enough to answer that the PRESIDENT spoke only of Cuba, while the Ministerial Bill applies only to Porto Rico. Judicious statesmen might perhaps hold that there is nothing wrong in consulting foreign opinion when it is well founded; and the expediency of looking abroad becomes more undeniable when there is an ulterior risk of alien interference. It would be much less offensive to Spanish pride to tolerate indirect American dictation than to submit to the loss of the West Indian colonies. It is in the meantime more convenient to appeal to Spanish generosity than to avow the motives which may possibly have affected the Minister's determination. ZORRILLA accordingly announces with ostentatious frequency the impossibility of introducing reforms into Cuba during the continuance of the insurrection, which was represented in the PRESIDENT'S Message as an additional reason for abolishing slavery. The strength of the resistance which he must be prepared to encounter is indicated by the resignation of two of his principal colleagues. There is no reason to suppose that the dissentients are the only members of the Progressist party who disapprove of emancipation; and therefore it seems probable that the small minority against the first reading of the Bill inadequately represents the force of the future opposition. The Republicans will perhaps remain neutral, or even support the Bill, unless they see a prospect of overthrowing the Ministry. No Spanish faction can be expected to prefer a principle to a party triumph.

Although it might perhaps have been impracticable to carry a Bill for the emancipation of slaves in Cuba, untoward results may follow the determination of the Government and the Cortes to maintain the existing institution as long as the insurrection continues. If indeed slavery were regarded by the people of Cuba as an evil, there would be plausible reasons for declaring that the penalty should be enforced as long as the crime of rebellion was not abandoned; but unfortunately the only point in which the insurgents agree with the professed loyalists is in the maintenance of slavery. The American citizens whom the PRESIDENT lately denounced as large owners of slaves in Cuba probably profess ardent sympathy with the insurrection. The rebels have never emancipated their own slaves, though they sometimes confiscate the human chattels of their enemies; and it therefore seems but an ineffective menace to warn them that if they persist in their treasonable conduct they will be allowed or compelled to maintain their favourite institution. It has sometimes been suspected that even the loyalists of Cuba are not inveterately opposed to the continuance of an insurrection which brings them a supply of Spanish troops and Spanish money. It is certain that they have often thwarted the measures of the Home authorities; nor, indeed, is it easy to understand how the rebels can have maintained themselves so long, unless they receive countenance from some of their fellow-colonists. To both parties, equally devoted as they are to the maintenance of slavery, the Minister announces that complete pacification will be followed by compulsory abolition. The only sufficient excuse for his anomalous policy is conscious inability to abolish slavery in both islands at once, and the necessity of not arousing Spanish jealousy by seeming to countenance American interference. The Government of the United States, as it probably entertains no purpose of attempting the annexation of Cuba at present, may perhaps be disposed to assist ZORRILLA in his partial and tentative project of emancipation. It is certain that Cuba will, after no long interval, be forced to imitate the example of its neighbour, as it will, from the date of the emancipation of the negroes in Porto Rico, remain alone in its maintenance of the obnoxious institution. The Spanish Ministry may be congratulated on having associated their predominance with the assertion of a sound policy which, although it may disturb established prejudices, is at the same time calculated to attract much popular support.

CHARITABLE APPEALS.

THE column in the morning papers at this season headed "Charitable Appeals" is not pleasant reading. If it only brought the existence of poverty before us, it might be made pleasanter by a strenuous effort to extend and multiply the many agencies which aim at relieving poverty. But unhappily it also brings before us the want of wisdom or system which characterizes too many of these efforts, and the lax way in which benevolent persons try to get rid of their money and their responsibilities at the same time. The mischiefs of indiscriminate charity are more than ordinarily visible this winter because the general condition of the labouring population is unusually good. Even in London the number of paupers is less by some forty thousand than it was three years ago. The open winter has been favourable to work, and the system of sending surplus hands to other parts of the country has enabled many who really want work to profit by the exceptional weather. But after full allowance has been made for all this improvement, there remains a huge mass of distress in which no sign of amendment is visible. Those who compose it have in many cases lost the wish as well as the power to do better. They have learned to prefer the indolent excitement of mendicancy to the rough, dull business of maintaining themselves by the work of their hands. For the most part they are miserably off, but their lives are at all events chequered by intervals of luck, and so have a charm which is lacking to the dull monotony of a hard, and probably ill paid, employment. There are thousands in London who, if the choice were given them, would prefer to beg 3*s.* 6*d.* a week for three weeks out of four, with the chance of getting 30*s.* in the fourth, rather than to earn 10*s.* a week the whole month through. Probably the industrious classes have no adequate idea of the repugnance which an habitual idler feels towards labour. Even if these people were willing to work, it does not follow that work would at once be forthcoming. The great system of charities which girdles the city round has for so long a time attracted to London the least provident part of the population, that the labour market is overstocked. Sir CHARLES TREVELYAN tells us that "an extraordinary number of widows and deserted wives with their children have "so overstocked the market for washing, charing, common "sewing, and other inferior kinds of labour in London, that "it is impossible for them to maintain themselves by honest "industry, even if they desired to do so." The only efficient way of dealing with such a crowd as this is to transplant them by degrees from London, until in the end they shall be absorbed by the various districts in which a demand for service labour still exists. It would be a process requiring time, as is [illegible] judgment, but if those on whom it had to be exercised would co-operate with such charitable persons as were willing to undertake the management of it, it would not be impracticable. It is this co-operation, however, that is wanting. How are you to transport a population who look on removal to a district where they would have no craft but between work and the Workhouse as equivalent to a sentence of penal servitude? If they found that starvation in London really meant the starvation which it does, even a sentence to work would have its attractions. But the most undeserving classes of this pauper army starve. "The widows," Sir CHARLES TREVELYAN says, "put on the cap" (which, like the gown of the King's bedesmen, is regarded as a license to

"the 'widow's half-crown' from the out-door relief, and go "the round of the charities, getting a soup or a dinner ticket "here, a bread or a grocery ticket there, and doles from district "visitors of different religious persuasions, with all of whom "they pretend to agree." What is true of widows especially is true in its degree of other classes. Even these charities may not be enough to support those dependent on them; but they form, so to speak, a fund a share in which is gained partly on the principle of a lottery, partly by superior proficiency in the arts of mendicancy. In this way they demoralize a larger circle than that which they actually feed, and whenever the disproportion between the numbers to be relieved and the means of relieving them becomes more than commonly great, there is the general public outside which can be squeezed by means of special appeals.

These are not new statements. For several years past they have been dinned into the ears of Londoners, but as yet with scarcely any visible success. There is nearly the same want of system, nearly the same overlapping of charitable areas, nearly the same regard for the immediate necessity without thought of the ultimate consequences, that there ever was. "Increased destitution," to quote Sir CHARLES TREVELYAN "again provokes more abundant relief, and more abundant relief "encourages those habits which lead to a further aggravation "of the destitution." The lesson which benevolent persons have yet to learn is, that when matters have come to such a pass as they have now, ultimate improvement must be purchased at the cost of present hardship, even to some whom we would willingly see exempted from it. Here and there, no doubt, in this crowd of vice and pauperism there are cases which deserve care and tenderness. It may be doubted indeed whether these are often found among those who profit by indiscriminate doles. But conceding, for the sake of argument, that they are, and that there would be no means of singling them out for relief if the indiscriminate doles were done away with, it would still be true that an army of mendicants ought not to be maintained in vice and idleness because a few honest workers have accidentally got mixed up with them. In the letters from Sir CHARLES TREVELYAN from which we have already made extracts two forms of relief are singled out for special condemnation. Soup-kitchens, though a rough and ready mode of preserving life in a time of general calamity, degenerate afterwards from the wholesale character of the operations into a "vast machinery for the en- "couragement of low idleness, hypocrisy and vice." Night Refuges, since the passing of the Houseless Poor Acts, have become mischievous, as tending to promote vagrancy by paralysing the efforts made by the Poor Law authorities to repress it. They are simply so many "annexes," in which the vagrant knows that he will not be exposed to official inspection. A third form of mendicancy instanced by Sir CHARLES TREVELYAN is crossing-sweeping, by which women, children, and able-bodied men are alike "tempted to adopt a lazy, shifty life, "dependent upon precarious alms." It is important to bear in mind that such evils as the last two cannot be met by simple denunciations. As regards Night Refuges, charitable persons must be assured that the casual wards of the London Workhouses really do their work—that no one is rejected who ought to be admitted, that no one is turned out without inquiry whom a little timely help might set on his legs again, that no one is prevented from seeking shelter in them by reason of moral annoyances which are worse than the physical sufferings of the streets. As long as any doubt prevails on these points, Night Refuges will continue to be supported. As regards crossing-sweepers, there is, as Sir CHARLES TREVELYAN himself points out, an actual service performed, and, so long as this continues to be rendered by persons not paid for their work, payment will continue to be made in the form of alms. As regards soup-kitchens there is not so much difficulty. They are almost always supported from sheer want of thought; those who keep them on foot have yet to learn that charity which is merely and obviously temporary in its aim, which feeds the hungry to-day without considering whether to do so may not lead to their being hungry to-morrow, must do harm, unless the relief is exceptional as well as tempo- rary. In the Lancashire cotton famine soup-kitchens were the most useful instrument for meeting a sudden need. But if the factory workers had been encouraged to expect them every winter, the whole district might by this time have been pauperized. Upon this point, therefore, preaching may do some good; upon the other two it has been shown that something more is wanted. The difficulty about Night Refuges may be met partly by the adoption of the separate system in the casual wards, which has been found to have great advantages in some country Unions, and partly by the establishment of a branch office of the Charity Organization Society in the neighbourhood of every casual ward. By this means, any case which needed to be looked into might be sure of meeting attention, and the claim put forward by some Night Refuges of possessing facilities for rendering permanent help which are denied to the casual wards, would no longer hold water. Crossing-sweepers can only be got rid of in one of two ways; either the local authorities must undertake to clean the crossings, as they do the roads, or some private society should take as many of them as its funds will allow, and have them kept in order by its own servants. In this way contributors would be sure that their money went to support regularly paid labour, not to encourage begging under cover of the sweeper's broom.

THE *TIMES* ON SPIRITUALISM.

THE *Times* was apparently in great straits last week for matter to fill its columns. It therefore had recourse to publishing a long and, if we may speak plainly, a silly discourse upon Spiritualism. The writer was one of those persons who apparently waver between scientific contempt and morbid curiosity. They affect to pooh-pooh the whole business of mediums and *séances*, and at the same time they flutter about them, and, if not themselves deceived, do their best to stimulate the curiosity of people sillier than themselves. The article referred to that wonderful Report of the Committee of the "Dialectical Society" upon which we commented some months back, but the main impulse to talking about Spiritualism just now appears to be a mysterious volume, which had been handed to the author under a "solemn promise" not to divulge the names of the people concerned. We are, however, informed with due reverence that amongst them are a dowager duchess, a nobleman, a captain in the Guards, a baronet, a member of Parliament, and others of less exalted position. The volume itself was printed by an earl, now dead, or, as the writer puts it, "who has lately passed beyond the House of Lords, beyond also, we trust, the spirit-peopled chairs and tables which in his lifetime he loved not wisely, but too well." That dowager duchesses and captains in the Guards should be victims to a degrading superstition is not quite an unprecedented phenomenon. Cagliostro succeeded in imposing even upon personages of royal blood. No rank, alas! is a sufficient protection against the extremes of human folly; and the most attractive game for an impostor are people who are at once rich, credulous, and idle. That class unluckily includes members of the peerage and the baronetage. The writer, however, further thought it necessary to witness some phenomena for himself. He was a good deal puzzled because, when sitting in a dark room with a couple of distinguished mediums, a chair was thrown upon the table. He saw some phenomena in the presence of Mr. Home and Miss Fox which were still more singular, such as a table rising from the ground in a room lighted by two "spirit lamps," whatever they may be; and an accordion playing a tune in Mr. Home's hands without visible interference, though the observer could not see the keys, nor tell whether they moved "There was nothing," he says, "during the whole evening except the phenomena themselves to suggest imposture." However, he very properly remembered Mr. Lewes's maxim, "Distinguish between facts and inferences from facts," and accordingly he did not infer that a dead man was playing on an accordion because certain sounds were produced by unknown means. That was a very wise reserve, and we could wish that it were more generally imitated. It appears, however, from the correspondence which has of course followed the article, that various people, including some men of science, are unable to refrain from inventing causes for the phenomena; and assume, because some odd things happen which are rather queerer than ordinary conjuring tricks, that invisible beings must be walking about and doing them. That such a jump from facts to fancies should be made quite unconsciously is a singular illustration of the ordinary condition of the human mind, even amongst persons who can observe some classes of facts with great accuracy.

It is, however, a pity that the *Times* should fill three or four columns with records of these stale and wearisome "manifestations." If anybody wishes to examine into the subject, he can do so with great ease and at very little expense. But why gratuitously advertise a sect which has turned many feeble brains and done no little social mischief? To a healthy-minded observer there is something inexpressibly disgusting about the whole system. To trade upon people's best affections for their departed friends, to profess to make a peepshow of dead fathers and husbands, and to carry out this purpose by simulating the morbid tendencies of diseased minds, is a trade so unutterably vile that one can scarcely speak with patience of those who practise it. If any mediums are impostors (and even mediums admit that there are such impostors), they deserve a term of penal servitude more thoroughly than any of the wretched old gipsy-women who tell fortunes to servant-girls. The imposition is grosser and far more pernicious to the persons deceived. To obtain money under false pretences is bad enough in all cases; but when the pretences are of a kind which may hopelessly upset the moral and intellectual equilibrium of those who are taken in, no words can be strong

enough to describe the baseness of the deceivers. For this reason alone, one would think that a respectable journal should be very scrupulous in giving fresh publicity to what, as it admits, and indeed is strongly inclined to think, may very likely be gross imposture.

But, it is said, there may very possibly be something in Spiritualism. Some mediums are eminently respectable people; and at any rate the matter demands scientific investigation. Very well; let it be scientifically investigated. Medical men have to investigate madness and all varieties of loathsome disease; but it does not follow that crowds of thoughtless and ignorant people should take up a pursuit for which they are totally unqualified, and which leads them into very serious danger of infection. People who don't know how to observe unconsciously spread the most monstrous fictions, and truth is obscured, not cleared, by their mixing themselves up in the inquiry. And meanwhile they run no little risk, if not of absolute insanity, at least of becoming addicted to observances not more reasonable than those of a mediæval wizard, or even a negro fetish-worshipper. If Spiritualism is a cheat and a humbug, this danger is manifest; but even if there is something in it—if, for example, as Mr. Cox maintains, the alleged phenomena are produced by some abnormal action of the nervous system—it is not less manifest that a most serious risk is incurred. Articles which encourage dowager duchesses and captains of the Guards to deliver themselves over tied and bound to obey the bidding of mediums by speaking seriously of the results obtained, are encouraging a bad practice which may be propagated to more useful members of society.

As, however, a good deal of curiosity upon the subject prevails, and is likely to be stimulated by such articles as those in the *Times*, we will suggest one or two reasons which should make people pause before encouraging séances and spiritual manifestations. In the first place, if there is anything in Spiritualism, nothing could be easier than to demonstrate its truth. Why do we believe, it is asked, in the revelations of the electric telegraph? Because we submit them to crucial experiments every day and every hour of the day. Why don't we believe in the revelations of mediums? Because they always evade a crucial experiment. Take a simple case. President Lincoln's assassination was known throughout America within an hour or two after it had happened. Such great evidence of course confirmed the truth of the report. If a Spiritualist had announced the event in England before it had come to us by any ordinary means (the submarine telegraph was not then laid down), we should have been convinced instantaneously that Spiritualists possessed supernatural power. If, in fact, they possess the mean of knowing what is happening at distant times and places, they can place the reality of their claims beyond all conceivable cavil. They can prove their power fifty times a day. But any one proof would be sufficient. If a single revelation were made such as that of Lincoln's assassination, it would be enough. Why has no such proof ever been given? For the simple reason that the power does not exist. All the alleged wonders of this kind depend upon what A. said to B., and what B. repeated to C., and so on. If a single witness has lied or made a mistake, they are valueless. A man claims a power of communicating with disembodied spirits; if he has it, opportunities for demonstrating it in the most public manner are open to him every day and all day long; and yet it is never done. And for this reason we recommend ordinary inquirers to wait. If the alleged power exists, it will prove itself. If it does not, they had better not waste time in examining into it.

Mr. Home, indeed, suggests a reply; and a wonderful reply it is. The spirits, it seems, are capricious. It may be so; but a philosopher is bound to accept the simplest explanation consistent with the facts. Perhaps, when a watch is missing from my pocket and is transferred to that of a notorious thief by no visible agency, a spirit may have done the trick; but it is safer to assume that the thief managed to do it without my seeing it. The same argument applies to Mr. Home's spirits. So long as their caprice leads them always to shrink from a crucial test, it is simpler to assume that they don't exist. Give us a phenomenon otherwise inexplicable, and we will accept your explanation; but so long as you give nothing which may not be explained by assuming a certain quantity of roguery, imbecility, or, it may be, morbid action of the brain, we shall not go out of our way to assume the existence of spirits. The Spiritualists prove a great deal too much; if a tenth part of what they say is true, they have the means of publicly demonstrating their supernatural powers. They never do. What is the obvious inference? If it were declared that the heir to an estate who had been lost really existed; if he might recover his property by simply showing himself in Westminster Hall; if he obstinately refused to come, but offered to produce a number of affidavits from people who had met him in dark rooms, or talked to him for a minute in his attorney's office, what should we think of him?

For this reason we may be pretty sure that the truth will not suffer by the abstinence of dowager duchesses and others from attendance upon *séances*. But there is a positive reason, of much more weight, for their staying away. Whatever may be the meaning of Spiritualism, one thing is undeniable. It is a belief of which rogues and charlatans of every variety may take advantage for the basest purposes. When a mere conjuring trick is regarded as proof that the performer possesses supernatural authority, what is likely to be the condition of the person who takes the conjuror for a spiritual adviser? We heard nothing more about spiritual assistance being vouchsafed to the Davenport Brothers after the rope-tying trick had been found out. But many respectable, and even generally intelligent, persons were for a time as fully convinced that the rope was untied by supernatural agency as they now are that Mr. Home is lifted into the air by spirits. Their conviction was confessedly a delusion; as indeed the trick is now exposed at every street corner. It is needless to dilate upon the mischiefs which would result, and which in fact do result, to a person who takes a notorious juggler and liar—such a man, for example, as Mr. Browning's inimitable "Sludge"—to be a director of his conscience. A sincere Spiritualist must of course agree with us in this, as in fact Mr. Home appears to do. The medium through whom a widow receives communications from her dead husband should be above all suspicion of sordid motives. Otherwise the impostors who mix with the honest men will have the fullest opportunity of carrying out the worst designs, and, instead of receiving a message from the dead, their unfortunate victims will be only receiving a message from Mr. Sludge. No one should more carefully guard against the sham than those who believe in the existence of the genuine article. And therefore it is an obvious consideration that a medium should never receive money. The evidence for genuine miracles depends to no small degree on the character of the witnesses. If the early teachers of Christianity had made a comfortable income out of their disciples for showing wonders, instead of expressing themselves to martyrdom, we should have a very different opinion of their honesty. To creep into the houses of silly widows was a practice which required very vehement denunciation. An honest man may conceivably take money for introducing us to the spirit world, but it is quite certain that a knave will take money for pretending to do so. And therefore, unless we would give a direct encouragement to rogues, and help to overlay the reality—if there be a reality—by a mass of falsehood, the less ordinary people have to do with professional traders in Spiritualism the better.

Mr. Home, as we have said, seems to agree with us; at least he declares that he has never taken money for showing off his spirits. Let us give him all the honour due to such admirable independence. So long as he makes no money by his performances, directly or indirectly, the value of his testimony will be greatly increased. And therefore we consider it to be a cause for sincere congratulation that the Court of Chancery ordered him to restore Mrs Lyon's thirty thousand pounds. Indeed we cannot doubt that he would have returned it of his own accord as soon as it had occurred to him that the great cause of Spiritualism would suffer injury from the precedent. The manifestations which took place in a certain cab were doubtless owing to "unconscious cerebration," if not to spirits. But then people of less lofty character might cerebrate consciously, and we should have no means of detecting the difference. The story shows how easily a man actuated by the purest motives may be led into practices susceptible of an unpleasant interpretation, and we hope that Mr. Home will throw the weight of his authority into enforcing the excellent rule that no mediums should ever receive money on any pretence from those who consult them, in which case we strongly suspect that the true nature of the system would speedily appear.

THE PROPOSED HISTORY SCHOOL AT CAMBRIDGE.

WE were glad some time back to see that so wise a choice had been made as that which named Mr. A. W. Ward to be an Examiner in the Law and History Tripos at Cambridge. The distinguished Professor of History at Manchester presently gave the results of his temporary return to work in the elder seat of learning in the form of a pamphlet containing suggestions which needed only to be followed to work a very great work indeed. Mr. Ward's proposal was simply this—to establish a real School of History at Cambridge, from which all the narrow restrictions with which ignorance and prejudice have surrounded the subject should be swept away. Mr. Ward is a real student of history; he is one of those who have grasped the great but simple truth of the Unity of History. He has learned that man is the same, whatever the land he lives in or the tongue he speaks; he has learned that to study the history of one time and place needs the same method and the same faculties which are needed to study the history of another. He is therefore for wiping away all the senseless and artificial barriers which the tradition of a time that has passed away has set up to hinder the intelligent study of the history of man. As one who has himself studied history as a whole, who has shown himself equally at home among the Claudian and among the Austrian Cæsars, Mr. Ward stood up to ask that his University should cast away shallow and unworthy prejudice, that it should break down the silly barriers of "ancient" and "modern," and should set up a School of History, and not any such mockery of it as a School of "Modern" History. The wonderful thing is that Mr. Ward seems to have got the University of Cambridge to listen to him at once. A Syndicate was appointed, last May to consider what alterations should be made in the Law and History Tripos, and we have now before us the Report of that Syndicate, which recommends, not only that the Schools of Law and History shall be separated, as they have just been at Oxford, but that the School of History shall really be a School of History. The opening words of that part of their Report with which we are concerned put the whole matter in its true light:—

The Syndicate consider that History, as the subject of an independent

Tripos, requires to be placed on a wider basis than its subordinate position in other Triposes has hitherto allowed; and believe that in this manner its efficacy in education may best be secured. They propose therefore that Ancient and Mediæval History should have their due place in the Tripos, as well as Modern History, so that History may be placed before the Student as a whole.

They go on to recommend

That in this Examination one paper at least shall be allotted to each of the following subjects:—

1. English History.
2. A special subject belonging to Ancient History.
3. A special subject belonging to Mediæval History.
4. A special subject belonging to Modern History.

(Either (3) or (4) to be always taken from English History. In subjects (2), (3), and (4) some knowledge of the chief original sources will be expected).

All this is just as it should be. So is the proposal that while professional Law is rightly sent away to its own place in a School of its own, the historical aspect of Law, Constitutional Law, and the Principles of General Jurisprudence are to find their place in the Historical Tripos. There are a number of technical details which we need not examine, and which of course may be considered and modified before the scheme becomes a statute of the University. But all the main principles for which real historical students have so long striven are here fully acknowledged. The success is something wonderful. The doctrine which Mr. Ward has preached at Cambridge, and which the Syndicate has now adopted, is the same doctrine which has for more than twenty years been preached at Oxford with much the same success as the doctrine which the charmer of the Psalmist preached to the deaf adder. Cambridge, in short, if the report of the Syndicate be adopted, will show that she looks upon the history of Oxford in this matter, not as the pattern to follow, but as the horrid example to avoid. Perhaps, however, the whole thing is only an instance of the law that nobody is so foolish as he who is wise before the time. Some day or other the reform which seems likely to be made at Cambridge will be made at Oxford also, and then those who make it will pride themselves on their new and brilliant discovery, and will forget that the discovery was made, but only to be mocked at, a generation before.

The doctrine of the Unity of History, the doctrine which, as far as we know, Arnold was the first to put forth, and of which Mr. Ward and the Cambridge Syndicate have now appeared as the latest champions, is one which has to fight a very hard battle, because it runs counter to so many different kinds of prejudices on so many different sides. Take, for instance, the fate of the solitary and forlorn attempts which have been ever and anon made at Oxford to do what it is now proposed to do at Cambridge—to establish a real School of History, to break down unnatural barriers, and to take up Thucydides and Tacitus, Procopius and Cassiodorus, Lambert of Hersfeld and Matthew Paris, as parts of one study, to be mastered by the use of one method, and to be taken up in one School of examination. Proposals of this kind have for the last twenty years or more been met with equal scorn from enemies of very different kinds. The scorn was equal because the ignorance was equal, and yet both scorn and ignorance took widely different forms. There were the comfortable, easy-going Heads and other dignitaries of the old school. By the help of a little schoolboy learning they had raised themselves, in the reported words of one of the most famous of their number, to "places of very considerable emolument" from which they could "look down with contempt on their inferiors." Who were the pestilent youngsters who were troubling the world with schemes for making men learn things which they had themselves got on so well without learning? Then there were men who were real scholars within a certain narrow field, so far as men who wilfully confine themselves to a narrow field can be called real scholars. There were men who really knew something of the languages and the history of one or two arbitrarily chosen nations during a few arbitrarily chosen centuries, but who had never thought of the relations which those nations and their languages bear to other kindred nations and languages in the general history of man. Men who thus shut up learning and scholarship within so narrow a range might really be honestly shocked at the notion of setting up the study of other ages, nations, and languages—of ages, nations, and languages which they had learned to look upon as barbarous—side by side with the sacred pair which alone could claim admission within the magic circle. And their horror might well be deeper still when they were called on, not only to set up other studies alongside of their own on equal terms, but to accept those studies as absolutely the same with their own, as being alike parts of one greater whole, either part of which was lame and imperfect without its fellow. Then, besides the two types of conservatism, there was the class of eager and shallow reformers, the men who wanted some new thing, but did not know exactly what new thing they wanted—the men who thought it would be less trouble to keep the old studies as they were, and to set up the new as a separate thing beside them, than to go through the painful exercise of thought which was needed to put the new and the old in their true and harmonious relation to one another. In the days of the Crusades there were those who taught that the Holy War was a new and happy invention whereby men might win the promises of the Gospel without the painful practice of its virtues; so now there were those who taught that a School of Modern History was a new and happy invention whereby the rich and idle might find their way to the honours of the Class List without the painful discipline of thought and study which were needed in the elder Schools. These were the men who would fain bring in Modern History as an "easy" study, a study which needed no searching into original authorities, no mastery of obsolete or foreign tongues, but which might be got up by a few months' pleasant turning over the pages of three or four modern text-books. When men like these were told of a school in which Thucydides and Lambert should stand side by side, they turned away with the scorn of men who had never heard of Lambert, but who knew enough of Thucydides to know that in an easy School he could have no place. These were the men who decreed that from their easy School the first six centuries of English history should be shut out, and who, when pressed for their reason, gave the reason of men who had never heard of the English Chronicles—that for those centuries no text-books could be found. The School which was called into being on such theories as these has flourished far better than could have been looked for, because successive Examiners have done their best to soften the vices which are inherent in its origin. But those vices can never wholly be got rid of until, instead of a School of Modern History, we have a School of History, until what Arnold spoke of as "what is falsely called ancient history, the really modern history of Greece and Rome," is brought back to its natural companionship with the history of other ages, and set free from its unnatural union with the Objective and the Unconditioned.

Against all these various classes of enemies the doctrine which is set forth in Mr. Ward's pamphlet and in the Report of the Syndicate has had to fight at Oxford. At Cambridge it seems to have better luck; for it is a great step for it to have got into the Report of a Syndicate; no Oxford Delegacy has ever reported in favour of the kind. But both Mr. Ward's scheme and the scheme of the Syndicate are as yet merely schemes. Of the particular proposals put forth in both some are naturally of a purely technical kind, and do not present much interest, except to those who are familiar with the working in detail of the Cambridge system of examinations. But the main proposals of both do indeed go to the root of the matter. From the History School as sketched either by Mr. Ward or by the Syndicate all unnatural barriers and divisions are swept away. "Ancient," "mediæval," "modern," are dealt with as divisions which have no existence, further than as it may be needful to take care that no one part of history should be so exclusively studied as to shut out the others. By Mr. Ward indeed the names are used under a sort of implied protest, something like the way in which the names of the three British kingdoms have been used in public documents since the Union. As we talk in Acts of Parliament of "that part of the United Kingdom called England," "Scotland," or "Ireland," so Mr. Ward speaks of "history of the period called ancient," "mediæval," or "modern." Neither he nor the Syndicate will have anything to say to it, except to secure that papers shall be set in all three. Mr. Ward's scheme and that of the Syndicate do not seem to be exactly the same with regard to subjects and periods, but this is matter of detail which those who have finally to settle the matter may be left to consider. In Mr. Ward's scheme at any rate the highest branch of the examination would be of the most thorough kind. Mr. Ward proposes that each candidate for honours should take up both a subject and a period, each to be chosen by himself from a list to be put out by the Board of Studies. These subjects and periods are to be thoroughly mastered in the original authorities in their own tongues. Mr. Ward here cuts right in the teeth of one very common form of ignorant prejudice on the subject. Nothing frightened both the conservative party and the shallow party at Oxford so much as the first admission of original authorities in their own tongues. It was such a monstrous thing to expect anybody to know anything of French, Italian, or German. It was such a monstrous thing to expect the rich and idle men for whom an easy school had been invented, to know anything of Latin or Greek. Mr. Ward points out the difference, one which people of either of those kinds did not understand, between an examination in a language and an examination in a book written in that language. The candidate should be able to show that he has really read his book in the original and not in a crib. He should show that he understands such technical uses of words and names as concern his subject; but the grammatical niceties which might arise in an examination in the same book in a School of Language would be quite out of place in an examination in a School of History. The knowledge which is needful to enable a man to make good use of a history written in a particular language is a very different thing from such a knowledge of the same language as would be needed in an examination for an Ireland scholarship or a Classical Tripos. A School of History will rightly demand the former; with the latter it has nothing to do. The direct and minute knowledge of language must be tested, not in the School of History, but in the School of Language. We say in the School of Language, because when we have got rid of the antiquated narrowness which is implied in the distinction between "ancient" and "modern" History, we must get rid also of such a kindred piece of antiquated narrowness as a school of "classical" languages only. On this matter we will let Mr. Ward speak for himself:—

It seems to follow as a matter of course, that while in the preliminary part of the Examination no question should be asked implying a reference to original authorities, or knowledge of other languages besides the English, whether "ancient" or "modern," in the case of the substantial portion a careful reference to original authorities should be regarded as an indispensable element in the preparation of the Candidate. According to the

period and subject selected by him, it will therefore be necessary for him to have acquired such a knowledge of "ancient" or "modern" languages as will suffice for his purposes as a Historical student. But these acquirements will only be *incidentally* tested; not made the *subject* of any part of the Examination; and questions of an *essentially* philological or linguistic character will be as a matter of principle avoided by the Examiners.

It is, we believe, argued against the proposed scheme that something more is wanted for a degree than only to pass the Cambridge Previous Examination and such an examination as is now proposed. With this question we have nothing to do. We speak of the proposed History Tripos simply as a School of History, and we hold that, if well worked in its details, it will be a thoroughly good School of History. Its relations to other Cambridge Examinations are not to the purpose. It might or might not be a good thing to strengthen the Previous Examination, or to bring in something like the Oxford Moderations. Such questions are not now to the point. We speak of the proposed History School simply as a History School, and in that character it has our best wishes.

THE WEATHER AND ITS FRIENDS.

WE should think the Archbishop of Canterbury must have been rather taken aback by the reception which his letter about the weather has met with in various quarters. For the stale witticisms of the scoffers he was probably prepared; but it could hardly have occurred to him that the bad weather about which everybody has been grumbling and groaning should command such ardent and enthusiastic championship. The incident suggests an obvious moral, and shapes itself almost naturally into the form of an apologue. Once upon a time—it is difficult to persuade ourselves that somewhere or other we have not read something like this before—once upon a time there was a good Archbishop who, hearing everybody complaining of the weather and abusing it, proposed that pious men should pray for a change; which he had no sooner done than instantly a great many people began to cry out that there never was nicer or more wholesome weather since the world began, and that it was a pity it should not last for ever. It has already been discovered that it is an ill wind that blows nobody good, and it may now be said that it must be very bad weather indeed which does not please somebody. For the last month and more we have had almost incessant rain, great tracts of country have been covered with water, and in some parts the inhabitants have had to confine themselves to the upper stories of their dwellings, with every prospect, if the floods continue, of having to seek refuge on the roofs. A vast amount of property has been destroyed by inundations, communications have been interrupted, and all kinds of agricultural work have been greatly impeded, if not absolutely suspended. The last harvest was a bad one, and there is reason to fear that the next may be worse. In town, life has been passed literally in a Slough of Despond. The resources of civilization in the richest city in the world are apparently unequal to the superhuman task of keeping the streets decently clean in wet weather, and for days and weeks the inhabitants have had to struggle piteously through a sea of filthy mud. Ordinary people, accustomed to think more of their own immediate comfort than of next year's crops, have certainly found the ceaseless rain sufficiently unpleasant and depressing; and the Archbishop may be excused for imagining that a little fine weather would probably be welcomed as an agreeable change. This is one side of the picture; but it is as well that we should see the other side too. Mr. Bailey Denton, for example, instead of feeling aggrieved at the excessive rainfall, glories in it, and is only sorry that it is not a great deal more abundant. He calculates that in a single month of this last autumn sufficient rain fell on the surface of England and Wales to furnish the whole population with water at the rate of thirty gallons a head for eighteen years. Mr. Denton is known to be an enthusiast for water, but the people whose land has for the present been drowned out of sight, all but the tops of the trees, and who have been nearly washed away themselves, might possibly prefer, as a matter of choice, to receive their allowance of water in more moderate instalments. Mr. Denton is not satisfied even yet. With him a gallon in the well is worth two in the clouds, and he seems to think it necessary to provide for the contingency of our never having any rain again. We have had a drought already; and now we are having compensation in a copious rainfall, and there is no reason to suppose that alternations of dry and wet seasons will not continue to the end of time. It may be well to be thankful for rain without wishing that it should rain for ever. Mr. Denton adopts a more popular line of argument when he points to the statistics of public health as showing the sanitary advantages of the kind of weather we have lately been experiencing. As a matter of fact, the health of the population has certainly been better than usual. The Registrar-General's returns for the past week fully confirm all that has been said on this part of the subject. During the last thirteen weeks there has been a reduction of twenty-two per cent. in the mortality of London; in other words, some five thousand lives have been saved which, according to ordinary experience, would have been sacrificed if the weather had not been so unusually mild. To people of middle age the cold makes little difference; but a sharp frost mows down children and old persons like a volley of musketry. The rain has been beneficial in two ways. It has brought with it a mild temperature, very favourable to the young, the aged, and the sickly, and it has also washed the air and diluted the noxious impurities of the water we drink. For the present the old saying that a green Yule makes a fat churchyard would certainly seem to be contradicted; but it may possibly be found that the famine or relapsing fever which has just broken out in London may not be altogether unconnected with the close, damp, and depressing weather of the last month or two. And besides we may find that the ice and snow have only been postponed, not averted.

One of the correspondents of the *Times* who have attacked the Archbishop of Canterbury for his letter to the clergy observes contemptuously that the prayer which His Grace recommends was written when men were so ignorant as to suppose that rain was a mere watering-pot contrivance adapted to local wants, and that there could be rain in one parish without reference to the state of the atmosphere in the next. It may be observed that the Liturgy does not profess to be a manual of scientific information compiled by man for the guidance of his Maker; and all that the Prayer for Fair Weather asks is that God will send "such weather as that we may receive the fruits of the earth in due season," without prescribing the manner in which this result is to be produced. Prayers which are based on an assumption of the perfect wisdom as well as omnipotence of the Deity naturally imply trustful acquiescence in whatever physical laws He may have appointed. It would appear, however, that people are unfortunately apt to forget that there are others besides themselves in the world, and that everything cannot be arranged exactly to suit their personal convenience at each particular moment. The sort of weather which is one man's misery may be another man's happiness; and a *plébiscite* with a view to ascertain the most popular degrees of temperature would certainly yield some curious results. It may be doubted whether an absolute majority would be obtained for any one kind of climate. Everybody has his own private taste on this subject, and thinks that what happens to suit him must necessarily be best for other people. The gentleman who wrote to the *Times* to glorify the strawberry bed which had supplied him with ripe fruit for his Christmas dinner, from his own garden, no doubt regarded this remarkable achievement as an ample justification for any departure from the usual climatic conditions of the season. Another correspondent expressed his amazement that the Archbishop of Canterbury should be so perverse and unfeeling as to suggest prayers directed against the nice mild weather which has been so favourable to his invalid son, and has rendered a voyage to Madeira unnecessary. Against the dish of winter strawberries may be set the possible loss of the wheat crop, and our taste of the climate of Madeira, however acceptable to consumptive patients, has not been without its drawbacks to other people. If five thousand lives have been saved in England, a great many have been lost in Italy, and it is impossible not to connect the inundations in Southern Europe with the warm humid atmosphere of our own country during the last few weeks. A man would perhaps hesitate to pray for the drowning of Italian peasants, but a prayer that England might for one winter enjoy a foreign climate is perhaps only the same thing looked at from the other side. It may be assumed that meteorology is as yet only in its infancy, and there is no reason to suppose that our knowledge of the variations of the winds and clouds may not some day be reduced to the same scientific precision as our knowledge of the course of the tides or the process of the planets. In the meantime enough is known to show the connexion of meteorological phenomena throughout the world, and to remove the rain-clouds from the sphere of parish politics. Perhaps the most satisfactory frame of mind to cultivate in regard to the weather is to take it as it comes, and try to make the best of it. It is said of Mary Garth in *Middlemarch* that, having early observed that life was not shaped to suit her convenience, she had accordingly made up her mind not to expect it, and wasted no time in astonishment or annoyance at the fact. It is comforting to know that there is so much to be said in favour of the late bad weather, and that if it has made many persons miserable, it has also made others happy. We would merely observe that the people who like it need not lose their temper with people who do not. They have had a very fair innings, and for our own part we should certainly not be disposed to object to a little dry weather if only for the sake of a change.

Archbishop Tait may possibly now have recovered from his surprise that the clergy should hesitate about meddling with the weather. Congregations which are all of one mind about the weather may of course do as they please, but a clergyman who desires to have a quiet life will perhaps do well to sound his parishioners as to their private feelings on the subject before he commits himself to a definite line of policy in regard to the elements. Nor should he neglect to take counsel with the clergymen of adjoining parishes. It is not desirable that the weather should be made an additional cause of strife between High Church and Low Church, Ritualists and Evangelicals. As for the Nonconformists it is to be feared that, in their present temper, they would be sure to side on this, as on every other question, against the Church, and to protest against fine weather being thrust down their throats, whether they liked it or not, at the dictation of an Archbishop. If the Church went in for fair weather, the Dissenters would have no alternative but to pray for rain. Indeed we rather wonder that the Liberation Society has not already sounded a note of alarm. It is quite conceivable that, armed with the Registrar-General's figures, the Dissenters might be able to make a strong appeal to the prejudices of town populations. The rain, it would be urged,

was handsomely washing out the towns without adding to the rates, and it would be monstrous that the health of the people in the great centres of industry should be sacrificed in order to add to the gains of grasping landowners and farmers. Asthmatic and consumptive people would probably be won over to this side without much difficulty; and the prayers for dry weather would be represented as a conspiracy between the Church and the agricultural classes against the public health. On the eve of a general election a good deal of capital might be got out of this cry by judicious agitation; and Mr. Miall and his friends might be trusted to make the most of a new grievance. The clergy would perhaps find themselves on safer ground if, without espousing the cause of any particular kind of weather, they contented themselves with persuading their parishioners to accommodate themselves as cheerfully as possible to all variations of climate, and to study how to make the best of them, rather than to desire that the weather should be altered at every turn to suit their own fancies as to what would be best for their private interests. Mr. Bailey Denton has no sympathy for farmers who yield to the delusion that it is possible for them to have too much water. If fields are inundated, that is only, he holds, because they have not been properly drained. By under-drainage and proper surface cultivation, with ordinary discretion in the selection of time for tillage operations, much of the wheat now in jeopardy might, we are assured, have been safely planted. Mr. Denton is an enthusiast about drainage and the storage of water, and he probably does not do justice to the difficulties with which the farmers have to contend. But his remark is a practical one, and as wet seasons are not unknown in this country, and may be expected to recur, it would perhaps be worth while for the farmers to consider whether an excessive rainfall cannot be turned to good account, instead of trusting too much to having the weather adjusted to local convenience or caprice.

POLITICAL CANDIDATES.

NO general election is likely to bear any comparison in the number of contests to which it has given rise with the one which, in spite of any statements to the contrary, constituencies insist upon believing is to take place in the autumn of next year. In counties and in boroughs one or two candidates, if not more, are already visible against the horizon. Every moment their forms are becoming more and more distinct, suggesting disagreeable doubts to the minds of the sitting members with regard to their security of tenure. In the midst of all these preparations one feature is remarkable. The country gentleman has to a great extent withdrawn himself from active participation in politics, which may be accounted for by several circumstances. Constituencies demand far more attention than in former times; political duties leave so little leisure for country pursuits and sports, the amount of labour is so great which is required to make a man popular who does not provide amusements for his fellow-creatures, or to enable him to retain a seat when won, that he is apt to hesitate before he enters upon a course which will entirely alter his mode of life. If his income is only a moderate one, the expenses will appear formidable; it is no pleasant matter to spend fifteen hundred or two thousand pounds out of his income when he has five or six children to educate, and a good many sets of farm-buildings out of repair. The expenditure of such a sum as this is hardly felt by the successful trader or coal proprietor whose enormous profits have just enabled him to give forty-five years' purchase for a landed estate in the county. Men of this stamp raise the standard, and make the way very difficult for those of moderate incomes to follow. The constituency, too, becomes demoralized, and looks upon the size of a subscription as the best measure of Parliamentary ability. These causes operate equally in the case of both Conservatives and Liberals, and explain the curious state of the representation of certain small towns. If the country gentleman is a Liberal, another influence is at work in preventing him from taking a keen personal interest in what is going on. He has got to the end of his Whiggism. The old hereditary antagonism to the Conservatives may still exist, and induce him to vote with his party; but enthusiasm is out of the question when he does not know what may be the fruit of another year's legislation, what additional burdens may be placed upon his property, what new relations may exist between his tenants and himself, and what the position of his brother, the parson of the parish, will be when the Church has been disestablished. His creed is virtually dead, and there is no candidate representing his views to contest either his county or his borough. His support, therefore, is but a very lukewarm one to the man who has come from the clouds, from whom he is repelled by his social instincts, and whose professions he is inclined to distrust. Even the local ironmaster, whose position is satisfactorily evinced by groups of active chimneys, and who has just left the red-brick house with green railings in the centre of the town for a more ambitious residence, does not appear to him unexceptionable as a future legislator.

When the successful trader allows himself to be put in nomination we should like to know what are his real springs of action, and what it is that enables him at the mature age of fifty to go through even the preliminary stages of a contest. Is he aware of the extent of his labours? To arrive at the desired goal involves incessant toil in these days. Canvassing, instead of being limited to one or two months before an election, becomes for years just as much a part of the routine of daily life as eating and sleeping. The candidate's normal occupation is that of subscribing to the borough charities. Is there a widow who has lost a cow or pig, and, in defiance of all the rules of political economy, insists upon investing the proceeds of her begging in another perishable animal? Does a Bethesda require new stoves, or the parish church a fresh peal of bells? Is the local breed of horses to be encouraged by the donation of a candidate's cup? Is there some orphan in need of a mother, or shall a teapot be presented to the postmaster's wife or the outgoing curate? In all these cases the candidate is the person to apply to, and is generally not sought after in vain. He must take the chair on all occasions, and his time must be at the disposal of the constituency; he has no excuse for absence, and the borough thus secures the services of a representative in town and a representative in the country. Gradually, as the Parliament increases in age, and the hopes of his supporters and retainers become stronger, the allusions to his candidateship are clearer and clearer, until the auspicious moment has arrived when, in obedience to the highest motives and the dictates of his conscience, which forbids him to hide his light any longer under a bushel, he emerges into the glare of public life, and announces his intention of coming forward to contest the borough on the first vacancy that may occur. He has already spent as much money as would have bought a seat under the old *régime*, and still he is only a candidate. Let him consider what he will have to endure, and, warned in time, seek the shelter of his green railings again. If he is a Liberal, he has the agreeable task before him of endeavouring to unite the sections of heterogeneous opinions which exist in the borough. Politics produce as many quarrels as the relations of father to son. There is always a large body of gentlemen who have voted at the previous election solely from a vague idea that something was to be done for them, and who vent their dissatisfaction by changing their colour on the next opportunity. One mainstay of the party has quarrelled about the registration, the expenses of which have of course been borne by the candidate; one gentleman was promised a seat on the Commission of the Peace, another a clerkship, but the Lord-Lieutenant was obdurate, and the clerkship has been given to some one else. The candidate must pacify them all, sympathize, implore, promise, and cajole. Every expression of opinion must be treated with deference in Lagado. One Liberal is extracting sunbeams from cucumbers, another is milking a ram, while a third is holding the pail (to borrow a metaphor from Addison), and the candidate must show his interest, if not join personally in the work. He must "be brave and vow reformation; must promise that there shall be in England seven halfpenny loaves sold for a penny; and that the three-hooped pot shall have ten hoops." He must reconcile impossibilities, conciliate the licensing interest and the teetotallers, obtain the support of the Church, and yet not offend the Nonconformists. One Conservative is quite enough to represent all shades of Conservative opinion, and may count upon the undivided support of the whole party; the Liberal, on the other hand, can never be sure that competitor after competitor will not start upon the scene.

Just as he imagines that his difficulties are over, the workingmen's candidate comes down to show the constituency how easy it is to have the most advanced opinions when the thinker has nothing to lose. He has hardly disappeared when the representative of what the writer in the *Quarterly* calls "the venomous clique of Academical Radicals," makes his appearance to complicate matters still further. The exponent of venom speaks of politics as a science, of government as a study, of the faint analogy which exists between the smelting of iron and the fashioning of the minds of men—an observation which, after the contest is over, and Lagado perhaps disfranchised, the ironmaster will perceive to be personal. The Ballot ought to have made house to house canvassing impossible (for there can be no more ludicrous anomaly than to ask a man in private how he is going to vote, and yet punish him for declaring it in public); but ten days before the nomination he will find that his opponent has visited every elector; so, bullied by his agents, will endeavour to do the same. Up and down the narrow alleys and courts he will hurry; now stopping under the lamp to make out the blurred figures in his canvass-book, and wondering how a human being can be so difficult to find. Hodge is a quadruple entry, in each case distinguished by a different Christian name, and for a long time baffles the researches of agent and of principal. When this free and independent elector is discovered he is in bed, and cannot be expected when awakened from his first sleep to take a lively interest in the problem of local taxation. So the canvass is postponed, and as there is only one hour in the day when Hodge is at home, the probability of ascertaining his political convictions becomes very problematical. The candidate passes up another dark passage in despair; it is true that he has a carriage, but he might just as well have taken it out when shooting over turnip fields. He has spent thousands of pounds in indirect bribery, but when he is taken into the coal-hole by the wife of the cottager and asked in the simplest manner what he is prepared to give her, he beats a nervous retreat, half believing that he has brought himself under the provisions of the Act. He next looks into an influential beer-house, where a gentleman on the settle by the fire, in an advanced stage of political fervour and intoxication, is enunciating his opinion that he the candidate "will not go." This position he defends in spite of the entrance of the can-

didate, who, though he stimulates the consumption of beer, loses half an hour in the discussion of the last municipal struggle. If these private appearances entail discomfort, his public attempts will ensure misery. We recommend to his attention Mr. Brooke's address to the electors of Middlemarch. Each successive speech will only recall the miseries of the first, with the same interpellations, inconsequent questions, and personal allusions. He will not have the same moral support that his antagonist secures. The Conservative squires look upon an election as a saturnalia, during which their natural exclusiveness is in abeyance. Like flies in amber, the dirtiest of voters, not to return until the following day to the Sabine farm, are seen grinning from the huge family coaches which have been dragged into the service. Horace throws his arms round drunken Davus, and leads him to the national school.

The question naturally suggests itself, With what object has all this inconvenience been undergone? It is not ambition, or the desire of participating in the government of the country, though our candidate's ignorance of the English language would no more unfit him for that duty than for the head-mastership of a public school. It is certainly not the desire of benefitting his fellow-creatures; nor, again, is it the hope of a higher self-culture that actuates him. Even if art and literature have been more than mere names to him, he will have far less time than before to employ in the cultivation of literary or æsthetic tastes; and though he may be a shrewd man of business—the difficulty in the manufacture of which is very much overrated—he will find himself an unimportant item in the machinery of State. Before the first Reform Bill, a member of Parliament had perhaps the opportunities of belonging to a different class of society from his own, as the natural result of his Parliamentary honours; but this can be no longer predicated with regard to him. The only social pre-eminence that he can expect is among his own friends, and unless he possesses some special qualifications to fit him for more refined or educated society, he will not attain to it. In London his position is little changed, and whether he be a Liberal or Conservative, he will only have the entry of three, or possibly four, large houses, into which he will walk arm-in-arm with his wife during political receptions. Parliamentary custom once required that every city and borough should elect none but members of their own community, and though we do not regret that this custom should have fallen into disuse, the supply of modern political vagrants or carpet-baggers is far above the demand. Of no honour in his own county, the vagrant with two thousand pounds in his pocket starts on a tour to see what constituency he can relieve "from the thraldom to which it has been subjected," and implores them to shake off their yoke. Great havoc was made of this class in 1868, for the farmers did not understand what "yoke" meant, and stared in bucolic astonishment at their liberators. The agricultural mind looks upon its representative as first bound to represent it in the county, to give away the prizes at shows, and attend the infirmary balls. The House of Commons is all very well in its way, but the primary duty of a member is to have something pleasant to say, and to answer promptly letters upon local business. This was a state of things the vagrant could not understand; no previous knowledge enabled him to deal with it, and he left the constituency when defeated almost inclined to believe that the British farmer has no settled views upon abstract subjects, and will often seem to prefer his own interest to that of any one else. Sometimes he is successful, and a happy accident will put him into possession of a seat. His path is not, however, strewn with roses; of a sanguine and childlike disposition, he believes that the question of representation merely involves the announcement of political opinions, and that the faithful discharge of a delegate's duties is sufficient to ensure unanimity and prevent opposition. Why, indeed, should not everybody rest contented? He can say with truth that he has never thought for himself; on all points he has consulted his agents and constituents, and has gone down in the middle of the Session to explain his conduct. The pressure of a few violent men will induce him to pledge his vacillating mind to the support of any line of policy, until at last his Communism only stops short of Tom Paine's recommendations in not suggesting a donation of 20s. each for 50,000 births, and the same sum for 20,000 marriages. The country gentleman looks upon him as the Blatant Beast in the *Fairy Queen*, or would do so if he were familiar with that poem:—

> Through all estates he found that he had past
> In which he many massacres had left,
> And to the clergy now was come at last.

But no Calidore is required to subdue him; the strings which have been pulled so often to open his eyes or to shut them, as the case may be, have disordered the whole of his constitution. At last the pull is on some occasion too violent, and is followed by the collapse, not the resistance, of the patient. The bran has run out, and political life is a retrospect, to be contemplated with regret by himself alone, for nothing can be conceived more lowering to a high standard of political morality than that it should be necessary after the formation of every independent opinion to deprecate the antagonism of individuals or of sections.

CHRONIC ALCOHOLISM.

THIS is supposed to be an age of progress, and any one who ventures to hint that the progress is not altogether in the most desirable direction must expect, we suppose, to be ridiculed and denounced as old-fashioned and reactionary. If there is one kind of progress more than another on which we pride ourselves, it is our social progress. No opportunity is lost of comparing ourselves with our benighted grandfathers or great-grandfathers, and congratulating ourselves on our delicacy and refinement of manners as compared, or rather contrasted, with the manners of the Regency or of George III.'s time. Drunkenness, for example—how often do we hear this said!—has descended quite to the lowest classes. No gentleman gets drunk now, and even in the lowest class drunkenness is beginning to be considered discreditable. We should rather question the second of these assertions, but the first is no doubt true enough. Gentlemen certainly do not get drunk nowadays—that is, drunk in the old sense of the term. They do not sit long after dinner, and they are always fit to join the ladies. Four-bottle men have gone the way of the dodo and the pterodactyl; and even two-bottle men—that is, men accustomed to drain their two bottles of wine at a sitting—are hardly to be met with. It is not considered necessary at a card party after dinner to pass a hat round, as in other days the cocked-hat went round, to assist the confused eyesight of the company in discovering the last dealer; and even in old Scotch houses a boy "to lowse the neck-cloths" has ceased to be retained on the establishment. Drinking bouts are out of fashion. The consumption of wine at bachelors' parties does not, as a rule, much exceed that at a dinner party at which ladies are present. Even in crack regiments which used to pride themselves on what they could go through in the way of hard drinking, the amount of wine now taken at dinner would, in the eyes of a toper of the Regency, be regarded as the portion of an ascetic, barely enough to moisten the throat. And then, after dinner, there are no wild "finishes." There can be no question, we should say, that gentlemen are nowadays more sober in their bearing than they used to be; at least they do not drink so as to lose their heads or their legs. Admitting, however, that the scandal of open and unmistakable drunkenness has passed away from the upper and middle classes, we venture to doubt whether the drinking habits of the present time are in reality so much more sober or wholesome than those of the last or of the penultimate generation. It must not be forgotten that a man may be intoxicated without being drunk. Intoxication simply means poisoning, and the amount of slow poisoning which is constantly going on in this way is really very terrible to any one who knows the symptoms and who observes what is passing around him. Seventy or eighty years ago men habitually drank heavily after dinner, and it was certainly not an unusual thing to be carried drunk to bed. The carouse followed a substantial meal, and the topers slept off their debauch. They spent a good deal of their time each day in the open air, and their work, whatever it was, did not involve close, sustained, exhausting application. It will be at once seen what an advantage they enjoyed in this respect over the men of our own day, who have comparatively little out-of-door exercise, and who have to bear the strain of intense, anxious work, and who, when they drink, drink in a way that gives the stomach no rest, and that keeps the nerves in a constantly excited state. Formerly the very grossness of the bacchanalian habits of the men revolted the women, and kept them to a great extent beyond the reach of temptation. But now ladies and gentlemen all live much more together, and the men drink so decorously and discreetly that the ladies fear no harm in following their example. But in this respect the capacity of the sexes is certainly not on an equality, as the prevalence of what are by courtesy called nervous disorders among women too painfully testifies.

We are quite ready to admit that decorum is in itself a good thing. The familiar spectacle of gentlemen speechless and staggering from the effects of heavy potations could not fail to have a degrading and brutalizing effect upon the society to which they belonged. It is morally an advance that men should be ashamed of being seen in this odious and filthy condition. But decorum may be in itself a snare, and it is well that the truth, however coarse, vulgar, and unpleasant it may be, should be faced. It must be remembered that the three-bottle and four-bottle men of other days were after all exceptional men, and a mere handful in the community, and that, although most men then thought little of getting drunk, this was with a great many an indulgence which they allowed themselves not habitually, but only on special occasions, and with intervals between. The main difference between the drinking habits of the last generation and of the present would seem to be, that formerly men, when they sat down to drink, drank more at a time, while now men drink moderately at a sitting, but in sips or "nips" drink a good deal during each day. Whether the modern habit is better than the old habit is a question which possesses only a speculative interest. The important thing is, that the modern habit should be recognized as vicious and unwholesome. We are aware that this is quite an old story now, and perhaps people may be tired of its repetition. Unfortunately the necessity for speaking of it does not appear to have diminished. About a year ago the doctors published a declaration respecting alcohol, insisting that, as a medicine, it ought to be prescribed with the same care and precision as any other powerful drug, and

pointing out that its value as an article of diet was immensely overrated. The document also recommended legislation with a view to confine the use of alcohol within proper limits, and to promote habits of temperance. For our own part, we should be disposed to rely much more confidently on the personal influence of the doctors themselves than on any kind of legislation. Something may be done by legislation to enforce order and decorum in the streets and in places of common resort, and to curtail the facilities for public drinking, but after all this is only making clean the outside of the platter. Most reasonable persons will admit that the Licensing Act goes about as far in this direction as is practicable, if indeed it does not rather overshoot the mark. It is just because we are convinced of the powerlessness of legislation, because we distrust all violent coercive measures, and have no faith in any reform which does not spring from voluntary restraints and an improved state of public opinion, that we feel bound once more, at the risk of wearisome iteration, to call attention to the subject. The Excise returns, the statistics of criminal offences, the warnings of the doctors, the feverishness and excitement of social life, the prevalence of nervous disorders, the crowded drinking bars, and the marked increase of the number of reeling drunkards in the streets, all point to the same conclusion. It is impossible to doubt the growing intemperance of the working classes. Personal observation on such a point may sometimes be misleading, but the same story comes from all parts of the country. As a rule, high wages seem to mean only more drinking; and drinking means wife-beating at home and fighting in the streets. Mr. Vernon Harcourt, who objects to the stringency of the Licensing Act, appears to think it necessary to argue that the country is really very temperate and sober. We have as little liking for restrictive legislation as Mr. Harcourt, but we see no use in shutting our eyes to unpleasant facts. It is necessary to distinguish between the bigotry and fanaticism of the Teetotalers and the basis of truth which underlies their agitation. The evil which they denounce unhappily exists, and even their violent and distempered imaginations can hardly exaggerate its magnitude. It may be reasonable to resist the tyrannical measures which the total abstainers are anxious to impose upon the country, but it is idle to pretend that the country is in this respect in a satisfactory condition. It is scarcely a consolation to be told that the vast increase in the expenditure on intoxicating liquors is a proof of the prosperity of the nation. It is doubtful whether the present high rates of wages will be maintained; but, if they fall, the passion for stimulants which has already been developed will unfortunately remain. Anybody who reads the police reports will see the steady increase of cases of brutal assaults, especially on women, which may be traced to drinking. The present "genial" season has been appropriately celebrated—a woman raping with her husband and a friend suddenly flung out of window; a man stabbed by his wife, a wife by her husband, a girl by her sweetheart. "Thank God Christmas is over!" we heard a poor woman say the other day as she straddled her staggering husband up the steps of a railway station.

We are quite of one mind with the Bishop of Peterborough that, if it is necessary to choose, freedom is better than sobriety; but it is not impossible for people to be free and sober too. The criminal statistics compiled by the police show an increase of more than forty per cent. in the convictions for drunkenness before the magistrates in England and Wales in 1871 as compared with the average of the previous ten years. The Excise and Customs returns show a vast increase in the consumption of all kinds of drink, and especially of spirits. The country has been thriving, wages have been high, and the surplus earnings have been spent chiefly in liquor. These are not pleasant facts, and they hardly confirm those pretty theories of social progress of which we hear so much. But progress has been said to be like a wave which sometimes seems to retire even in the course of advancing, and this may perhaps be only one of the backward movements of social improvement. As far as we can see, there is nothing to be done in the matter except to direct attention to the facts, and leave them to make their impression on the public mind. It is reserved nowadays for the working-man to get drunk in the old way, "like a lord," but the other classes, though they bear themselves more discreetly, suffer for their potations in other ways. Brandy and soda, bitter ale, odd glasses of sherry, nips, and pegs, and drams, keep up a perpetual irritation and excitement which, added to the cares and worries of business and the fatigues of social life, wear out the nerves, and are apt to end in hysteria or paralysis. The doctors, who are aware of the spreading evil, might do much to check it, and their duty in the matter was certainly not exhausted by the signing of the declaration of a year ago. The lesson needs to be constantly and emphatically enforced. The evil should be probed to its root in neglect of sanitary and dietetic rules, and the forced pace of social and especially of business life. The attempt to get through ten hours' work in five or six explains in a great measure the craving for stimulants. People, though they have more holidays than they used to have, get less rest, and rest is what they want.

BALZAC'S EUGÉNIE GRANDET.

THE lives of women, and especially of young women, are often strangely separated from the life of the principal personage of the house they live in. There are houses, especially in small country towns, where there is a remarkable difference of scale in the interests of the lives that are passed in them; where the father is occupied with vast pecuniary transactions, and the daughters are economizing shillings; where the father takes a share in considerable public concerns, and the daughters have the field of their activities limited to the garden and the Sunday school; where the father gets richer or poorer every day, and yet no one in the household knows anything of the fluctuations in his fortune, so regularly goes the round of the little household matters, so unfailing are the fixed supplies. This separation of interests—this exclusion of the women from the man's thoughts and anxieties, arising partly from true paternal kindness which desires to bear the burden of life as much as possible alone, partly from a well-grounded fear of the talkative indiscretion of young people, partly from an apprehension that, if they knew the full gains of a successful year, they might count too readily upon their permanence—is not rare in our own country, but it is still less rare in France. The French girl is educated on the principle that it is well, in her case, to prolong the ignorance and inexperience of her childhood to the very eve of marriage. She believes that "Papa is rich," or she is told that "Papa is not rich"; or, more frequently, she has no distinct idea on the subject, either one way or the other, but simply sees the smooth working of the house-machine, as ladies see steam-engines going steadily in some mysterious way without inquiring how much coal they burn, or whether the supplies are likely to be ample or insufficient. The wife knows these things in most cases pretty accurately, but the daughter hardly ever knows them till she is a married woman; perhaps even then her knowledge will be limited to the extent of her own dowry, until the old man dies, and his last will and testament reveals the secret of his affairs. In some exceptional cases the mother is treated with the same reserve, and is purposely kept in ignorance of the progress of an increasing fortune, lest her expenditure should hinder accumulation. The most perfect type of the money-maker deeply enjoys secrecy for itself; he feels as if his beloved treasure would be less securely his own if another knew the full extent of it. He likes the vague reputation for wealth, but he is intensely, even morbidly, anxious that the reputation should remain vague, and he dreads an approach to any accurate publicity.

Monsieur Grandet, father of Eugénie Grandet, was an *amare* of this perfect type. Living in the quiet town of Saumur on the Loire, he had passed successively through the trades of cooper, little wine-merchant, large wine-merchant, proprietor of vineyards, money-lender, speculator in estates, till finally in his old age he was a great financial power in his own neighbourhood, and still preserved the frugal habits of earlier years, living in a dismal old house—and old houses can be fearfully dismal in those ancient towns—with his wife and daughter and a single maid-servant, a tall, strong, ugly, devotedly faithful and simple-hearted creature, who worked all day long at man's work and woman's work, not being ornamental in the least, but useful to the utmost of a domestic's possible utility. Old Grandet was in little danger of seeing his riches diminish through the extravagance of women, for he himself gave out the daily supplies for the little household, knowing exactly how many lumps of sugar were used, and what they were used for, how much butter (and it was not much) went for the cookery, and whether to-day's dish might be eked out for to-morrow's necessities. Old Grandet had imposed tribute upon his tenants—not an uncommon custom in France even at the present day, and a relic of feudal usage—so that besides their rent they brought him regular supplies of provisions. They brought him fowls, and eggs, and vegetables, and fruit; he never went to the butcher, and to the grocer as little as might be. His fuel came from his own woods, his wine from his own vineyards, and he kept the key of the cellar. He knew the number of his pears, and gave out the rotten ones to be eaten, two or three at a time. All communications concerning household matters passed directly between old Grandet and the strong servant, *la grande Nanon*, whilst Madame Grandet and her daughter sat in the gloomy salon, by their accustomed window. Hardly any money passed through their hands. M. Grandet gave a few gold pieces occasionally, but always asked for them back again, one by one, under pretext that he had no change. Since his wife was so entirely excluded from the government of her own house, it is unnecessary to add that she was permitted to take no part in the administration of old Grandet's estates. He managed everything for himself, and he managed everything so well that his riches increased prodigiously.

At the ripe age of twenty-three Eugénie Grandet knew as much of the world as a young nun, and as much of money matters as a baby. The old man's reserved ways and frequent harshness had driven the two women to seek consolation in each other's affection, and that affection had come to be their whole life. Madame Grandet could not enlarge her daughter's mind beyond the narrow circle of her limited and sad experience, but the warmth of her tender maternal love did good to Eugénie's heart, and strengthened it with gentle nurture. A girl so educated was likely, if ever she loved a man, to love him with the greatest singleness and persistence. Having had no experience of variety in affection, she would probably concentrate all her strength of feeling in a single devoted attachment of which the good or evil effects would colour her whole life.

The monotony of the daily life in that gloomy old house at Saumur was broken in upon one evening by the arrival of a young gentleman from Paris, Monsieur Charles Grandet, aged twenty-

two, and a perfect dandy. Though nearly related to Eugénie, being her first cousin, this specimen of Parisian elegance had not yet shone upon the darkness of that provincial existence. The two brothers, his father and old Grandet, had not seen each other for many years. Each had pursued wealth in his own way, the provincial in provincial simplicity, the Parisian with the usual Parisian accompaniments of expenditure and risk. The young dandy, as the bearer of a certain missive for his uncle, had hoped, in the lightness of his heart, to live for a while in the country the true *vieux château*, to shoot in his uncle's forests, and pass the time in pleasantness, one of a hundred guests. Young Charles Grandet was completely ignorant of middle-class provincial life, and fell into it, as it were, from the clouds. He came resolved to conquer by the superiority of his metropolitan civilization:—

His idea was to make his appearance with the superiority of a young man of fashion, to throw all the neighbourhood into despair by his luxury, to make an epoch, to import the inventions of Parisian existence. He intended to pass more time at Saumur in brushing his fingers and studying his toilet than in Paris itself, where a dandy will sometimes affect a not ungraceful negligence. He had brought with him the prettiest hunting-costume, the prettiest gun, the prettiest hunting-knife, with the prettiest sheath in Paris. He had brought his collection of ingenious waistcoats; there were white ones and black ones, there were waistcoats coloured like beetles with golden reflections, others double-breasted, some with collars standing up, and others with collars turned down, some of them buttoning up to the neck with gold buttons. He had brought all the varieties of collars and cravats which were in fashion at that time. He had two dress-coats by Busson, and the finest of linen. He had a pretty gold dressing-case, and a complete cargo of Parisian trifles.

This young gentleman arrived at his uncle's house in the perfect freshness of the most careful toilet, for, though just at the end of a long journey by diligence, he had taken care to avail himself of a rest at Tours by changing his costume and submitting his beautiful locks to the elaborate art of the coiffeur. A being so graceful as this Adonis had never entered that dingy old salon at Saumur. Eugénie Grandet looked upon him in wonder and admiration. Her mind became penetrated with the feeling that no care for him could be too attentive or too delicate. She made old Nanon commit unheard-of extravagances: she made her light a fire in the young gentleman's bedroom: she made her go to the grocer's to buy a candle for the guest superior to their tallow dips. She bought him sugar also, that he might drink *eau-sucrée* during the night, and thus be spared the possible inconveniences of thirst.

From that moment poor Eugénie Grandet's imagination was possessed and occupied by this Parisian charmer. But the next day gave her a more grave and serious interest in his destiny. That letter which he had brought to old Grandet from his father contained the announcement of a commercial disaster and of a fatal resolve. Being unable to meet his engagements, owing four millions of francs and being able to pay no more than one million, Grandet of Paris had resolved to escape from his shame by suicide. By the time his son reached Saumur this resolution had been carried into effect, and it remained only to the uncle to make the announcement to his nephew. In his view, the really serious misfortune was the bankruptcy and the consequent poverty which it entailed upon the youth. Charles Grandet, however, took his two misfortunes differently; he lamented his father with passionate tears, and bore the ruin with the lightness of youth and hope. What woman could have refused sympathy to a young man suddenly plunged into misfortunes so overwhelming, so terrible, and by him so unforeseen? Old Grandet's manner in making the announcement had not been tender, or even kind, but the two good ladies atoned for its hardness by the most affectionate and sincere sympathy. In the case of the younger one this sentiment rapidly gave place to one still more tender, and before old Grandet could in decency put his nephew out of the house, his only daughter and heiress had privately engaged herself to marry him.

The old man's idea was to pay his nephew's passage as far as Nantes, and embark him on some vessel bound for India, to perish or make his fortune as fate might decide. Balzac's picture of the brief space during which Charles and Eugénie remained together under the same roof is one of the most delicate and original in his writings. The mixture of womanly self-reliance in Eugénie's character with the hesitation of the most absolute inexperience in love affairs, the completeness with which at last she invested her happiness in the hope of her cousin's enduring affection and fortunate return, are painted with great care and the most finished detail. A girl in Eugénie's position, totally ignorant of men and men's ways, easily puts her trust and confidence in the first male creature that she loves. The gravity of character which a superior young woman acquires after twenty, when her life is dull and solitary and occupied in the discharge of monotonous duties, gives to her first love affair a seriousness beyond the evanescent attachments of children in their teens. In this case the seriousness of the attachment was on the female side considerably enhanced by the melancholy circumstances of the case. Charles had really loved his father, who, as is not uncommon with Frenchmen, had carefully cultivated a tender friendship with his boy. The sudden loss had been a cruel trial. Eugénie had heard the unfortunate young man moaning and lamenting throughout the sleepless night. With the simplicity of a character like hers, she had gone to his room alone and tried to comfort and console him. The hardness of her father's manner made this feminine kindness appear more natural and more necessary, whilst her father's rigid closeness in money matters had induced her to offer her hoard of savings for the payment of the sea passage to India. Charles, on his part, had confided to his cousin's keeping some precious things that came to him from his mother, and which he desired to save from the double risks of travel and of poverty. In this way their love was associated with the most serious and sacred feelings, and it became to her like a part of her religion.

For several years after her cousin's departure Eugénie Grandet remained in sad fidelity, not receiving a single letter, but trying to account to herself for this silence by the reasons which faithful women invent for their own consolation. Her treasure consisted of the things which had belonged to Charles's mother, and which he had confided to her care. She watched over the precious deposit as if it were an abiding evidence of his continual love and trust. The secret that she had lent him money became known to old Grandet through a habit which he had of asking on his fête-day to look at his girl's money, which indeed was almost a numismatic collection, for it consisted of large and rare gold pieces of many countries and reigns. This is a way of hoarding not very uncommon in provincial France at the present day, when a man will sometimes make the resolution to put aside all the gold pieces above the value of twenty francs that happen to get into his purse. Grandet had given many pieces of this kind to Eugénie—twenty Portuguese coins each of which was worth 180 francs, five Genoese worth a hundred francs, and many other curious coins of different nations, worth in the aggregate about 250*l*. All these she had given to her cousin, and when the fête-day came round, and old Grandet according to his custom asked to see them, the young lady's position became trying in the extreme. For had not there been a clear understanding that this money, like the guinea which the Vicar of Wakefield gave to his daughters, was never to go out of her hands, either by way of spending or of donation? The scene on the fête-day, when the money was not forthcoming, is one of the most dramatic in Balzac. It ends by a discovery of the girl's secret, and, to punish her, the old man imprisons her in her own room on a diet of bread and water, happily varied in practice by the devotion of the servant-woman, who at great risk conveys to her more substantial aliments.

The old man's temper after this produces complete domestic misery. His wife, whose health has been declining for years, is unable to bear the wretched moral atmosphere she has to live in, the constant unkindness, the separation from her daughter, so she loses her remnant of strength and quickly passes away. Eugénie is now dreadfully isolated, having nobody to love her but old Nanon. Finally Grandet himself dies, and then Eugénie finds herself the possessor of an enormous fortune. Her real treasures, however, were the relics confided to her by Charles, which she kept religiously, looking at them every day. A woman in Eugénie's position, with her singleness and simplicity of character, easily comes to have a remarkable permanence of sentiment and of thought. She becomes almost like a pensive heroine fixed on canvas by some painter, who year after year seems to be thinking the same thing, and feeling the same tender yet subdued emotion. After seven years of patience, constantly filled with thoughts of Charles, and vague wonderings as to his return, Eugénie said one evening to the old servant Nanon, "What, Nanon, will he not write to me once in seven years?"

After his departure from Saumur, the young gentleman had been successful in his first speculation, and, having inherited the commercial skill which existed in his family, continued to increase his little capital till he was able to undertake operations on a larger scale. Extremely active in business, he devoted himself to it body and soul, being possessed with the idea of reappearing one day at Paris in all the opulence of his luxurious youth. At first he had really treasured the remembrance of Eugénie, but a life of unrestrained immorality speedily obliterated it. Finally he returned with a considerable fortune, and in the same ship had for fellow-passengers the family of a nobleman who had a position at the Court of Charles X. This nobleman's wife thought him worth fishing for as a son-in-law, and caught him by the prospect of a brilliant social position, since, by an arrangement which would certainly receive the royal sanction, he might take the name and arms of D'Aubrion, and ultimately succeed to the marquisate. A month after his arrival in Paris, being still in ignorance of Eugénie's wealth, he wrote to her a cousinly, but not at all lover-like letter, enclosing a check for 8,000 francs in payment for the sum she had lent him, capital and interest, and announcing his marriage with Madlle. d'Aubrion, adding a few observations on the folly of love-marriages, and the necessity for considering the social position of his children.

So ended poor Eugénie's dream of seven years. Charles is punished by learning, too late, the extent of her enormous fortune. She adds a little to his punishment by paying what remains due to his father's creditors. Afterwards, persuaded by her religious adviser, she marries a magistrate capable of attending to her affairs, but her life is a broken life:—

Elle fut veuve à trente-six ans, riche de huit cent mille livres de rente, encore belle, mais comme une femme est belle à près de quarante ans. Son visage est blanc, reposé, calme. Sa voix est douce et recueillie, ses manières sont simples. Elle a toutes les noblesses de la douleur, la sainteté d'une personne qui n'a pas souillé son âme au contact du monde, mais aussi la raideur de la vieille fille et les habitudes mesquines que donne l'existence étroite de la province. Malgré ses huit cent mille livres de rente, elle vit comme avait vécu la pauvre Eugénie Grandet, n'allume le feu de sa chambre qu'aux jours où jadis son père lui permettait d'allumer le foyer de

la salle, et l'éteint conformément au programme en vigueur dans ses jeunes années. Elle est toujours vêtue comme l'était sa mère. La maison de Saumur, maison sans soleil, sans chaleur, sans cesse ombragée, mélancolique, est l'image de sa vie.

CRIME IN AMERICA AND ENGLAND.

A LENGTHY communication from Chicago which appeared in last Saturday's *Times* gives a gloomy picture of the insecurity of life in the Union. We are informed that five is believed to be the daily average of murders, while retributive justice follows on crime as slowly and almost as uncertainly as in Italy; that, judging from the difficulty of obtaining convictions, the sympathies of the juries seem often to be with the criminals; and that each State Governor possesses the prerogative of pardon, and is by no means chary in exercising it. We have no doubt that the American writer does not exaggerate in the indictment he draws against his countrymen. It is notorious that acts of violence and murder are of habitual occurrence in some of the States; that the force of the guardians of order told off to do duty in the Union is necessarily out of all proportion to the vast extent of the territory with its widely scattered population; that the laxity of moral tone prevalent in the newly settled districts at the back of civilization exists more or less throughout the length and breadth of the country, and that, whether from fear or favour, the Executive often shows itself unduly lenient. Perhaps the writer makes a mistake when he goes on to enforce his remarks by attempting to schedule categorically a long series of crimes committed in November. It was almost inevitable, indeed, that any attempt at illustration in detail should rather weaken his case, because the most carefully compiled list of the kind must necessarily fall very far short of the reality. For example, it is no doubt an ugly fact that at the time of his writing twenty-two men should be lying in the prisons of New York awaiting their trial for murder. But we remember that New York, with its suburbs, is believed to have the largest floating population of roughs of any city in the world; that the bulk of the emigrating rascality of Europe disembarks there; that arrests are often made somewhat promiscuously after confused scuffles in which blood has been shed, and that after all some of the twenty-two may be altogether innocent or merely guilty of manslaughter; while the variety of instances culled from police reports all over the country, although they may prove that things are very bad, yet scarcely prove them so bad as we should have fancied, or as they probably are in reality. It is plain that the writer has done his utmost to make his list exhaustive, for he eks it out with such cases as that of a lunatic who had killed an idiot—a deplorable accident which we need hardly say would excite neither surprise nor scandal in the most law-abiding community in the world. His idea of having recourse to detailed illustration may be a mistake, but we repeat that there is no reason for rejecting his conclusions or denying the general truthfulness of his picture. As he points out himself, there is no arriving even approximately at the actual number of murders. The most purposeless and horrible of them are those committed in districts of the West remote even from townlets which have already established the inevitable newspaper, or else in places where the editor writes in hourly fear of the revolvers of his rough and ready subscribers. It is plain from what he tells us that a general impression prevails in the States that recklessness and deeds of lawless violence are decidedly on the increase. It is proved as matter of fact that crime may be perpetrated with comparative impunity; that in a rude state of society, where dread of consequences is the surest restraint upon outrage, that dread of consequences is enfeebled by circumstances; and so it has come about that "some of the most respectable and cautious journals in the country are boldly advocating a return to Lynch law." Nor is it in the new Territories alone, or even in the Border States, that men who desire to live honestly and peaceably begin to talk of Judge Lynch and Vigilance Committees. The *New York Evening Post* suggests "a few doses of lamp-post justice" by way of cure for this crying evil, and it is significant enough that a high-class journal in the great commercial capital of the country should venture to offer such advice.

No doubt such a state of things is as discreditable as it is unfortunate, and the American press is probably right in averring that the authorities have shown undue remissness in dealing with it. Yet to a certain extent such a state of things is inevitable under the peculiar conditions of the country. Population has moved gradually westwards, carrying a rough legal machinery with it, but always leaving a broad belt of debatable land between the settler and cultivation on the one hand, and the desert and the savages on the other. The education and breeding of a pioneer of progress does not tend to develop the virtues that make a good citizen. Either he is a backwoodsman by descent, born and bred beyond reach of the influences of religion and civilization; he has been taught to lisp in oaths like his father before him, and has tumbled up from his childhood as rude in manners and loose in principles as he is coarse in speech. Or, worse still, he has known better things and cast them behind him; he has fled from the society with which he has gone to war, and is the more reckless that he has sacrificed character and self-respect. Such men have to hold their own with the savages or each other, for it is only recently that the Indians have been nearly exterminated, and the habits of Indian wars have left their traces. No man can trust his neighbour, or at least there are always many of his nearest neighbours whom he cannot trust. Of course every one goes armed in self-defence; nor can the law deny people the means of protecting themselves when it has no protection to offer them. Fatal accidents are frequent, for men become as free with their rifles and knives as they are with their speech, and local opinion is lenient to the homicide, and a death rarely takes place without something that may pass for provocation. But, wild as life always is on that border line which has hitherto been continually shifting, life there is decent and peaceable compared with what it is in some of the new cities among the mountains. Some of these, after having passed rapidly through various phases of existence, have settled down into something that is relatively respectable. But each of them in its infamous infancy was, by all accounts, simply a pandemonium. A gathering of reckless scoundrels, many of whom were suddenly enriched, assembled to corrupt each other. Every vice paraded itself in its naked monstrosity, and every vile passion broke out in full swing. Gambling dens and drinking saloons, with a sprinkling of brothels, offered their rival attractions to the man who had money, while those who were penniless and desperate indulged their envy, hatred, and malice in plotting crimes that might correct their evil fortune. Lust and covetousness were everywhere in the ascendant, and, warmed by drunkenness, of course they bred murder. When fierce men, flushed with fiery spirits, sat gambling all through the night, ruining and being ruined, blood and brawls were of ceaseless occurrence. The bowie-knife and revolver were always ready to hand, and stabs and shots were bandied as freely as looks or words elsewhere. Although many of these sinks of crime and corruption have been somewhat purified, yet new ones have been opened and are as foul as any of the others. It would be unreasonable to suppose that any country, however extensive, can escape the contamination of such foul plague spots. Boston and Philadelphia may indignantly repudiate the notion of their having anything in common with places so abandoned. But even Boston and Philadelphia cannot altogether escape their influence. The Colorado miner who has made his fortune is a citizen of the Great Republic, and wherever he chooses to go and to settle he carries with him his old recklessness. It may be chastened by his new surroundings; he may become a deacon and pillar of the Church, and purge and live cleanly as befits his new responsibilities. But the old leaven is there, and even in law-abiding New England the latent recklessness will break out upon provocation. And for one Western man who retires to New England, there are scores who settle in those Border States where rough old traditions still survive, and where the tone of feeling and opinion is not altogether uncongenial to wild Western manners.

These are the places which as yet are only aping the propriety which has become a matter of habit and principle elsewhere. So long as all goes smoothly, their demeanour is irreproachable. The judge, although he may smoke, expectorate, and whittle, administers justice with creditable judicial gravity. The barristers discharge their duties with tolerable decorum. On a sudden there is a hitch in the harmony of the proceedings. The opposite counsel give each other the lie, and each produces a pocket pistol from his brief-bag. The judge draws his own and interposes, and there is a free fight in Court. Next day the local journals duly report the course of the suit with the freest comments, and, should the judge have escaped scathless, he has probably to settle a difficulty with an editor by ordeal of battle in the street. Judicial episodes of this sort are constantly being reported in the American journals. Indeed some of the stories quoted in this very communication from Chicago are most telling, as indicating incidentally the existence of manners and customs that are the bane of social security in the Union. At Chicago a maidservant was accidentally killed in a boarding-house. It seems that there had been a scuffle between some of the boarders, and a pistol which one of them carried in his pocket had gone off by chance. Think of the inmates of a boarding establishment in Liverpool going armed in that fashion! In Indiana a judge shot an editor for a slanderous article. The editor had fully expected the attack, and it was plain that he was not assassinated without warning, for a couple of revolvers were found upon his person, and moreover he wore a coat of mail. Out of the Tower armoury an Englishman would find it hard to provide himself with a coat of mail at a moment's notice. In Tennessee an innkeeper shot a customer who criticized the breakfast that was served for him. In moral Massachusetts a gentleman fired seven shots at a couple of ladies, being moved thereto by jealousy. The truth is, that so long as certain districts are utterly lawless, the law will be commonly disregarded in others. So long as it is the fashion to carry fire-arms over a large portion of the area of the Great Republic, passionate men will use them on little or no provocation. We do not say that there is not ample room for a more stringent application of the law, and that the reform which is so loudly called for might not be accelerated by the more decided action of the authorities. But until those tides of population and civilization which are advancing respectively from the East and West shall have met in the middle of the continent, until new generations shall have grown up under healthier influences, we fear we shall still hear of those particular crimes which have always been the curse of the country.

We may join with the Americans in deploring evils which may be attributed in some measure to the vices natural to a young country that is growing fast. But while we are grateful that we are not altogether as they are, we cannot forget that we have

scandals of our own at home which we are far less able to excuse or extenuate. No district of England lies altogether beyond the reach of the ministers of justice and religion; we boast an instinctive reverence for the law, which has been steadily growing up in the course of centuries, while our dangerous classes are spared the temptation of murderous weapons always ready to their hands. Yet we fancy we might have produced a register of November crime that might have almost rivalled that of the Chicago writer, although its items might have been more monotonous and commonplace. For sheer brutality nothing from America can surpass the murder in the Durham coal country, where four men deliberately "took running kicks" at an unlucky wretch with whom they had no personal quarrel. Even in London, if every one had his due, we suspect there would be at least as many murderers waiting their trial as in New York. It is strange how little attention is paid to the number of bodies that are found under circumstances strongly presumptive of foul play. Corpses are continually being picked out of the Regent's Canal under circumstances that suggest murder rather than suicide. Infanticide would seem to be going on briskly again, if we are to judge from the frequency of inquests on the corpses of children that have been cast out into the streets. But juries find open verdicts, and isolated instances pass almost unnoticed. And while murder goes often undetected and unpunished, it would appear that disorder is decidedly on the increase. If we are to believe a deputation which had an interview the other day with the Chief Commissioner of Police, the state of the Strand has become worse than even that of the notorious Haymarket. Of an evening, when the many theatres empty, gangs of roughs and hawkers take possession of the pavements, shamming various illusory pursuits by way of blinds to their real objects. The thieves and prostitutes ply a thriving trade; the eyes and ears of decent people are alike shocked by obscenity. In fact, the rascality and immorality of London make a practice of assembling every evening to prey upon the well-to-do classes, while, to make things as pleasant for them as possible, we learn that eleven public-houses are open within a compass that gives an average of two to each seven householders. Well might the deputation of Strand ratepayers, in which we may presume the public-house keepers were not represented, implore the interposition of the police; and indeed the Chief Commissioner as good as confessed that their grievous complaints were well founded. We can conceive the detectives of Scotland Yard being baffled by some mysterious and exceptional crime, but we are driven to ask how such disorders as are described have been suffered to come to a head under the eyes of the police? No doubt there are criminals and sinners in abundance in America, but certainly an Englishman and a Londoner has little reason to play the part of the Pharisee.

THE OLD MASTERS AT THE ROYAL ACADEMY.

I.

THIS "fourth year" gives no indication that the art treasures of the country are near exhaustion; indeed in some directions the present collection surpasses its predecessors. For example, the finest Holbein yet seen in Burlington House is undoubtedly "The Two Ambassadors" (114); and the most important picture of the Pre-Raffaellite period we have met with for many a day is "The Assumption of Our Lady" (191), by Sandro Botticelli. The present exhibition too is fortified by several new contributors: the Duke of Hamilton, for instance, comes into the field for the first time; in fact, the eleven pictures which he lends have scarcely been seen before. The Earl of Radnor is also a great acquisition; he sends nineteen works, several of which are of the highest value. Further novelty is gained by the admission of one hundred and twenty-five water-colour drawings, and by an effective assemblage of statues in the Octagon Gallery, among which is conspicuous a coloured "Hebe" (260), by the late John Gibson. Deceased painters of the English school, among whom stand prominent Reynolds and Turner, again take their place with infinite credit among the great masters assembled from all times and countries. One serious drawback to all these exhibitions continues to be the number of spurious works which are allowed a place as tares among the wheat. In one room alone we counted six pictures wrongly named. Thus, "The Virgin and Child" (163), is certainly not by Ghirlandaio; neither is there sufficient reason to assign "The Last Supper" (164) to Masaccio; nor can we deem the "Portrait of the Artist's Wife" (161) worthy of Del Sarto; nor is "An Angel" (182) by Masaccio; at all events the treatment of drapery identifies the work with Northern Italy—the painter must be Mantegna, or one of his school; lastly, it is simply ridiculous to assign to Albert Dürer "A Triptych; Christ bearing His Cross—the Crucifixion—the Resurrection" (160). As the contributor of this spurious Durer sends no other picture, there can be no ground for the ordinary excuse that the bad works in a collection have to be taken in a lump with the good. Such a plea was valid when the whole of the Dudley Gallery was accepted, the condition then being that there should be neither selection nor rejection. Are we to suppose that trash gets smuggled in through favouritism? Once again, therefore, we must protest against the doctrine and practice proclaimed by the Academy, that it "can accept no responsibility" as to the authenticity of the works exhibited. Law Courts have decided that Railway Companies cannot, by printed notices, evade the responsibility of doing their duty; and surely there is a moral Court of Appeal from the Academy which will sustain an implied contract that spurious wares shall not be exposed on the assumption that the error will not be found out. We know that the question is not free from difficulty, but all the perplexities involved would diminish, if not absolutely vanish, in the presence of knowledge, firmness, and independence. If these qualities were brought to bear on the works tendered for exhibition, the printer of the Catalogue would not need to keep perpetually in type the words "The Academy can accept no responsibility." The Academy is under a responsibility which it cannot so easily throw off; it is the chartered representative of art throughout the country; it is the established teacher of the people; it cannot exhibit a spurious work or publish a false name without doing public wrong. Strange to say, the British Institution, though a body of dilettanti, and not professional, showed more critical knowledge than these Royal Academicians. At all events, the present collection, though in the bulk amazingly fine, wants weeding and pruning.

Let us draw special attention to "The Assumption of Our Lady" (191), a *cupi opera* by Sandro Botticelli, which Messrs. Crowe and Cavalcaselle in their exhaustive volumes acknowledge never to have seen. This marvellous composition, measuring no less than twelve feet by nearly eight, now in the collection of the Duke of Hamilton, is described in detail by Vasari. It was painted for one Matteo Palmieri, who, as the donor, became entitled to kneel with his wife in the foreground. The patron was so "learned and able a man" that he furnished the painter with ideas; but somehow the work, though it now appears eminently devout, was pronounced guilty of "grievous heresy," and consequently it was covered from view, and the altar at which it stood became interdicted. The heresy would seem to be that the Madonna kneels below the level on which the Saviour sits. But the times are now fortunately so altered that the theologian can look upon this elaborate composition of creeds and of colours with about as much edification as the artist. In the foreground is the tomb of the Madonna, empty save of white lilies, and around stand the twelve apostles, moved with grand yet grotesque amazement, after the uncouth yet inspired manner of Botticelli. The Blessed Virgin has already reached heaven; in other words, she has thrown herself on her knees before Christ, who reigns in the highest of the pictorial spheres. This portion of the work is possibly a little out of the prescribed rule; indeed the arrangement of the figures fits neither an Assumption nor a Coronation. However, the eye will speedily turn from lowest earth and highest heaven to the three intermediate cycles or zones, which, like three inverted rainbows of resplendent colour, span the whole of the upper space. Herein, according to the words of Vasari, abide "the Patriarchs, the Prophets, the Apostles, the Evangelists, the Martyrs, the Confessors, the Doctors, the Virgins, and the Hierarchies." It must be added that a countless multitude of seraphs, cherubs, and winged angels float in the air as birds of heaven, and make the fields of paradise bright as if strewn with many-coloured flowers. Gold is used freely in the decoration of wings and draperies, and is otherwise scattered about so as to give a glistening glory to realms of space. The spiritual ideas here thrown out with lavish exuberance and wild impetuosity were cherished in a more serene aspect by Fra Angelico. The subject, indeed, in its general arrangement is traditional, and comes down from much earlier times. Yet altogether novel is the suggestion of a structural dome, in the vault whereof the heavenly host find room enough and to spare. Botticelli was born in Florence in 1447 (not, as stated in the Catalogue, 1437), and, like Ghirlandaio and some other artists of the day, commenced life as a goldsmith. Botticelli died in comparative poverty in 1515. His works are unequal, as may be judged from the comparison of the "Adoration of the Magi" (193), lent by the Duke of Hamilton, with "The Holy Family" (166), contributed by Mr. Fuller Maitland. The student should not neglect the present opportunity of making more intimate acquaintance with this eccentric, original, and powerful painter. "Calumny," and "Venus Floating on the Sea," both in Florence, lie out of the beaten path of the period. Other Pre-Raffaellite artists appeal to the mind through a beauty which is the highest and purest manifestation of truth. Sandro Botticelli, on the contrary, exerts a spell by exalting ugliness into sublimity.

The early masters of Italy this year make but a scanty show. We may quote as an interesting curiosity the "Virgin and Child, with Angels" (165), bearing as a monogram a fly, corresponding with the supposed name of the artist, Mosca. We fail to find any such painter in Vasari or other books; though there is mention of Simone Mosca, a sculptor and architect, who worked in Orvieto and Pisa. The first half of the sixteenth century, however, to which this artist belongs, is too late for the style of the little work now exhibited. The manner is severe and detailed; the technique thin and dry as a tempera picture on panel. It is a pity that more is not known of this early product. In the absence of pedigree, internal evidence might give the picture a German paternity; the draperies, the circumstantial realism, and the details determine its birthplace, if not in Transalpine territory, at least within sight of the Alps. No mention is made by Messrs. Crowe and Cavalcaselle of "The Brethren of His Order Examining the Wounds of St. Francis of Assisi" (190), a work here ascribed to Beato Angelico. This composition, though possibly authentic, has certainly been greatly renovated and marred by some bold restorer. Another picture, in all probability only of a school, is "Peter and John at the Beautiful Gate of the Temple" (180),

set down in the Catalogue to Filippo Lippi. Indeed Messrs. Crowe and Cavalcaselle mention this work, with others equally dubious, in terms of apology. In fact, so little critical are our English collectors and dealers that pictures are often christened by conjecture, and names handed down by hearsay. Equally apocryphal as to master, though assuredly not in merit, is "An Angel" (182), falsely ascribed to Masaccio. Here, as before indicated, the broken up and angular draperies are not Tuscan, but Lombardic; the style is not that of the Carmine Chapel in Florence, but of the Church of the Eremitani in Padua. We recognize, too, the presence of a Northern school in the keen-cut outlines and in the stern handling of forms as in Lombard sculpture; bold and grand is the eager look and the onward movement of the figure as it floats through space towards the object of its worship. Such a work, notwithstanding obvious defects, awakens imagination, and fills the mind with fantasies which lie beyond the world of sense.

Luca Signorelli, the pupil of that great Umbro-Florentine, Piero della Francesca, and the forerunner, when in his maturity as seen at Orvieto, of Michael Angelo, is represented by one of his noblest compositions, "The Circumcision" (162). This picture, which comes like the great Botticelli on the opposite wall from Hamilton House, is signed "Lucas Cartonensis pinxit." The work seems identified with the picture said by Vasari to have been executed at Volterra, by means of the repainting of the Christ. Vasari relates that Bazzi spoiled the infant figure, and that this act of vandalism was strongly condemned. Messrs. Crowe and Cavalcaselle remark that the repainting seems to belong to a very distant period and is out of keeping with the rest of the altarpiece; the truth of the observation is patent to any well-trained eye. These critics continue as follows:—"The composition is one of Signorelli's best, well arranged and full of energy. The life-size figures are bold in action, yet unrestrained; the colour strong and of an olive tinge, with brown shadows. Firmness and truth of drawing are combined with a judicious distribution of light and shade." The composition, which is eminently symmetric, after the manner of artists accustomed to mural decoration and monumental work, is arranged within an architectural niche; two prophets in medallions, grand in manner, indicate that Signorelli, like Michael Angelo, brought his pictorial style into harmonious relation with the plastic arts. In statuesque firmness and solidity the figures are balanced. In the centre the Madonna holds on her lap the infant Christ; the High Priest raises his eyes and stretches his hands to heaven. Among numerous bystanders is not forgotten St. Joseph, "a grand apparition in full drapery, who contemplates the ceremony, and supports himself with a short staff." The female heads have a sweetness and a spirituality which comport more with Umbria than with the muscular school which Signorelli consolidated. The painter was born in 1441—that is, thirty-four years before Michael Angelo, and forty-two before Raffaelle. Thus he may be accounted, particularly in remembrance of his anatomical demonstrations in the Cathedral at Orvieto, a pioneer and an innovator. How much he owed to that creative genius Piero della Francesca, of whom there is here a small specimen (195), no one can tell who has not visited Arezzo. The National Gallery has no work by Signorelli.

The Academy again adduces evidence that our English collections are specially rich in masterworks from Venice. And no other school tells with such brilliant effect in an exhibition. A Venetian picture, whatever it may be besides, seldom fails in point of decoration; no other paintings throw upon a wall an equal amount of light and colour; no other compositions strike the eye at so great a distance. All this is emphatically true of that brilliant and broadly painted scene by Titian, "The Cornaro Family" on their knees before an altar (146). The work, which is lent by the present Duke of Northumberland, was purchased in 1656 by Algernon Percy, tenth Earl of Northumberland, at the sale of the effects of Vandyck. This picture holds a place of honour in the large room of the Academy, and is specially signalized by a canopy of drapery; the only other work thus distinguished is Holbein's picture of "The Two Ambassadors," which occupies the central place on the opposite wall. The hangers have thus pointed to these two compositions as the crowning efforts of the collected schools, and no two creations could possibly stand in stronger contrast, and yet in more distinct and individual supremacy; it is hard indeed to tell which has the advantage—the realism of Holbein, or the generalization and suggestiveness of the great Venetian. But we must defer the consideration of these and other works to a future occasion.

The Academy shows itself widely catholic in the diversity of schools which it not only tolerates, but holds up to admiration. Thus space is wisely given to the now somewhat neglected masters of Bologna. In the presence of two fairly good examples of Ludovico Carracci, a rare master, save in Bologna, "The Holy Family" (150), and "Charity" (156), both from the gallery of the Earl of Radnor, it may be instructive, as it is curious, to refer to the Discourses of Reynolds. Students of the Academy a hundred and three years ago are therein recommended to form their style on the model of Ludovico. The simplicity, or rather, "what the ancients called the corruption of the colours," gained by breaking and mixing the pigments, together with a breadth of light and a depth of shadow approaching the solemnity of twilight, are pointed to as specially in keeping with the gravity and solemnity of sacred and historic art. Since the days of Reynolds the mode of teaching, whether for better or for worse, has changed, and accordingly these pictures by Ludovico, as well as by his two contemporaries, Domenichino and Guercino, are now deemed wanting in closeness of study, in realistic truth, in the moderation and modesty of nature. Certainly it would be the ruin of any young painter to commence where the Bolognese left off, and indeed we can scarcely conceive of an art more corrupt than that which is flauntingly displayed large as life in "St. Sebastian" (213), by Domenichino, and in "San Luigi di Gonzaga received into the Society of Jesus" (225), by Guercino. Wide as the poles asunder from these blatant works is the early little picture to which we shall hereafter revert. "The Agony in the Garden" (176), by Raffaelle. The period is probably a little later than that of "The Vision of the Knight" in the National Gallery; the style still retains the distinguishing traits of the painter's master, Perugino, and is consequently true, simple, and devout.

THE THEATRES.

AT this season adult persons visit the theatres chiefly as a duty to their children and young friends, and if that duty be more than usually burdensome this year, there is the more credit in performing it. We therefore notice the dulness of the Drury Lane pantomime as a matter of interest rather to dramatic and literary critics than to the public, who would be bound to go and see it if it were ten times duller than it is. We think that in the introductory part the author has fallen behind his former efforts in the same line, and in the harlequinade there is not, so far as we remember, even one tolerably good joke. Happy are they who have never seen a pantomime before, and are therefore unable to draw comparisons between this and earlier productions at the same house. But if the manager really desires to be funny, he had better produce a serious drama without loss of time. The combat between Fitzjames and Roderick Dhu in the *Lady of the Lake* was much more diverting than any of the numerous encounters which may now be witnessed between the clown and the policeman. The company engaged for this pantomime includes Mr. Brittain Wright, who has been a great favourite of pit and gallery at Drury Lane Theatre from the time when he helped to lighten that dreary piece *Formosa*. But even he can do almost nothing to push this pantomime along; and the great and varied talent of the Vokes family is exercised to equally small advantage. The verdict of the public must, we fear, be that there is a strong company and a weak piece at Drury Lane. We mean, however, no more than this—that the piece is not equal to earlier efforts of the same author, who has to fear comparison rather with himself than with anybody else. After all perhaps the quality of the work does not greatly matter, as Drury Lane now stands in pantomime proper without a rival. A critic, or a person who usurps the name, has ventured to assert that it is possible to endure *Babil and Bijou* a second time. This, however, we take leave to doubt, and, as it is not a pantomime, we are not in duty called upon to try.

People who are oppressed with the gaieties of the season may be assured that if they can be dismal nowhere else an opportunity offers itself at the Globe Theatre. Feeling much admiration for the talent of Mr. Montague, and warmly approving his principle of management, it is unpleasant to remark that *Tears, Idle Tears*, are out of place at Christmas, and not particularly desirable at any time. The title has no special connexion with the subject of the piece, except that it has a doleful sound. Indeed, the tears which occur in the piece, far from being idle, are, as the doctor informs us, a sign of recovery from disease. It must be owned that Mr. Montague acts his strange part very well, and thus saves himself and the piece from the ridicule that always threatens to overtake it. He has been deranged four years, and when he begins to recover he is brought home, where he falls asleep on a sofa, and when he wakes an innocent plot of his wife and friends is used to persuade him that he has only been ill a week. Considering the time that this plot had been forming, the execution of it might be less slovenly. All newspapers and periodicals of recent date have been removed from the room in which he is expected to arrive. The *Quarterly Review* of a date before his illness, and with a page turned down by himself, is placed where he may see it. We should feel things to be more real and pleasant if we were told the title of the article he was reading. But when all this has been cunningly arranged, a maid-servant spoils it by bringing in a letter that has come by post. His suspicion is aroused by the post-mark, and he seeks for confirmatory evidence on the chimney-piece. It seems inevitable that he will find last week's milk bill, but the same result is more elegantly attained by the discovery of the wedding-card of a gentleman whom he remembers as only seventeen years old. Any way the pious fraud is exposed, and he satisfies himself that he has, as he supposed, been ill and away from home for four years. However, although the contrivance fails, the patient gets well without it. He had accidentally shot his son, a boy of four years old, and his mind gave way under this terrible affliction. After his removal from home another son was born, who is now about the age that his brother was when he was shot. At first he is persuaded that this is the son whom he used to love so much, and that the supposed accident was a dream. Then, beginning to suspect the plot, he calls for the boy, who luckily happens to be asleep. Thus the inevitable discovery is staved off for a few minutes, but it comes nevertheless, and proves less disastrous than had been expected. We accept the statement in the playbill that this piece, on its production in Paris, "created an interest universal and profound." The idea of the piece is

eminently French, and probably if such an idea had first occurred to an English dramatist, he would have dismissed it as unsuitable to our stage. In order that we may understand what we are about to see, a nurse is introduced, like Chorus in *King Henry V.*, to tell the dismal tale from the beginning. This proceeding, in itself slightly absurd, is made more so by the fact that the part of nurse is undertaken by Miss Hughes, a lady of well-known comic power. Thus we get a sensation approaching that which is experienced when Mr. Toole enters, as he is fond of doing, upon the domestic pathetic line of business. When Miss Hughes is overcome by pity for her unhappy master, we remember involuntarily that she used to be "the strongest woman in the world." The absurdity is something like that of putting a low comedian into the part of Oliver Cromwell. It is only fair to say that Miss Hughes looks adequately doleful and harrows our feelings as much as possible by her narrative. But still there is an incongruity about the whole thing which would be fatal to the piece if it were not fortunately short. We think that if it be performed at all, it ought to occur earlier in the evening, so as to allow time for something both good and lively to follow it. The entertainment begins with a particularly seasonable piece, also taken from the French, called *Weather Permitting*. Almost the only consolation we can suggest under the prevailing miserable weather is that a little fun is got out of it at this theatre, where, let us observe, real business begins at seven o'clock. This arrangement has perhaps been adopted in consideration of the early closing of public-houses, and certainly, when an evening begins with rain and goes on to tears, it may be desirable to fortify oneself against the influence of damp by a drop of gin or brandy before going to bed. The "new and original play" called *False Shame* is as good as several other recent plays which have enjoyed considerable popularity. The proposed duel is an anachronism, particularly as it is to be fought with swords, and the sentiment appropriated to Mr. Montague, "that if he must break the law of his country, he will do so in his country," is rather too extravagant for a cultivated audience. There is, however, a touch of nature in the father of the intending duellist, who insists that the honour of the family must be maintained, but is rather taken back on hearing that the event is to be brought off, as *Bell's Life* would say, in his own park.

The ingenuity which at one house founds a "comedietta" on the weather is equalled at another where the scene is laid at Geneva, and the characters are awaiting the result of the international arbitration. This piece is, we suppose, intended as an improvement upon the ordinary burlesque; but, although it begins well, there is hardly any progress afterwards. The transition from Geneva to Robinson Crusoe's island, under the guidance of "Imagination," produces only results of the most ordinary and prosaic kind. If we remember rightly, the only distinct object of the piece appears to be to provide Robinson Crusoe with a wife in the person of a strong-minded lady who travels alone and agitates for female suffrage. We are speaking of the Olympic Theatre, which has been lately opened by Miss Ada Cavendish, who, like Mr. Montague, appears to have fixed a standard of management which is difficult to maintain. The demand for new and original comedies, and for short light pieces which shall not be exactly burlesques, promises to exceed the supply. The opening of the Olympic Theatre has not been encouraging; but equal difficulty was experienced at the Vaudeville, which soon afterwards became one of the most popular theatres in London. The undertaking of Miss Cavendish will be little helped by the sympathy to which it is undoubtedly entitled. Hardly any piece can go well unless there is an audience to applaud it, and just now those entertainments which make least demand upon the intellect are most in favour. It is unfortunate, too, that Miss Cavendish has lately fallen, either by necessity or choice, upon unattractive plays. She does all that can be done with her own part in her own theatre, and yet we feel little satisfaction at the result. The play may be truly said to end with a catastrophe, for the principal actor in it gives himself a spin round and falls upon the floor dead. Several modern plays owe their chief effect to consumption; and this play depends upon heart disease. We may perhaps venture to hope that the medical profession will lend further aid to dramatic literature, which is admittedly in delicate health, and thus a variety of plays may be produced in which the hero or heroine may be made the victim of all the different diseases under which it is possible to look interesting. There is a certain ingenuity about this play which deserves notice. The hero is a Mexican adventurer who has made his fortune on the Paris Bourse. He knows that he is liable to die suddenly, and he knows also that his wife has listened to words of love whispered by an Austrian baron at a masked ball. He contrives to bully the Baron into marrying his wife's sister, to whom he leaves all his fortune. Thus he is reconciled to his own impending death by the punishment to be inflicted on his wife, who will be deprived at once of his money and of the Baron's love. It is obvious, however, that a young and handsome widow is not likely to find either of these losses irretrievable. We are bound to say that much is done for this piece by the acting, but the story, although it would doubtless excite interest in Paris, will hardly be popular in London. Then comes the attempt, of which we have already spoken, to make fun out of the Geneva arbitration, and this also is better intended than performed.

REVIEWS.

BOKHARA THE HOLY.*

TRANSOXANIA, or, within more restricted limits, the Khanate of Bokhara, is perhaps that part of Asia of which, in proportion to the kind and amount of its claims on their attention, European readers know least. It has been for long ages the highway of a more or less extensive commerce between the West and the far East; but remoteness, unpleasant nomadic methods of "interviewing" strangers, and the treatment received by later travellers in jealous, cruel, and bigoted "holy" Bokhara itself, had succeeded in preserving it almost unsullied by the foot of an infidel. But Russia has changed all that, and, for better or for worse, the destinies of Bokhara are henceforth bound up with the course of Western politics. A European may now travel securely in places where, less than ten years ago, a flaw in his disguise would have meant death; and the day may not be very distant when even the British excursionist, with his opera-glass and return ticket, may be comforting his weary and dust-soiled person with the far-famed wines and melons of Bokhara and Samarcand. Under these circumstances, readers will welcome the publication, for the first time in Europe, of a continuous—*i.e.* intelligible—history of the Khanate, in which an attentive student may trace the process whereby successive governments or misgovernments of Arabs, Samanides, Seljukides, Timurides, Uzbegs, &c. have fashioned the Bokhariot of to-day.

Naturally, the details of the pre-Islamitic period are very meagre. But as one of the earliest recorded exploits of the Bokhariots was to tie their prince in a sack of thorns and roll him about until death relieved him of his troubles, it must be granted that they seem to have distinguished themselves from the very first in a manner worthy of all that we know of them from the time of Alexander of Macedon to that of his Russian namesake. This period is interesting chiefly from an ethnographic view-point. References in the Vendidad to Herat, Balkh, Sogd, Merve, &c., as being produced by the first creative efforts of Ormuzd; Arab traditions, more or less defined, of a Zend dialect; the early and general prevalence of fire-worship; and the mention of Balkh as the place chosen by Zoroaster to preach his new doctrines after he had fled from his native province of Azerbidjan—are put forth by Mr. Vambéry as proofs that the early settlers of Central Asia were Iranians, by whom the fire-worship was spread, northwards and westwards, over the lands between the Oxus and Jaxartes. In the first century Buddhism also existed there, being professed by the Toorki and other Turanian elements of the population; and the word "Bokhara" itself means a Buddhist convent. Lastly, the Nestorians, having made the West too hot for themselves, settled near the Zerefshan, where they enjoyed their metaphysical hair-splitting in peace, and, before A.D. 520, founded a bishopric of Samarcand. St. Thomas has been credited with the introduction of Christianity beyond the Oxus, but then St. Thomas has been called upon to do duty in almost every clime from Malabar to Anahuac. Those fire-worshipping Iranians who formed the more numerous, or at all events more important, part of the Transoxan population, were lovers of peace, and settled only in the fertile districts and in the large towns, where they manufactured their famous sword-blades, cottons, carpet stuffs, and were the go-betweens in the silk trade between China and the Mediterranean. That the Central Asian fire-worshippers were enviably prosperous and wealthy is proved by the frequent and successful visits, beginning A.D. 666, of those fervid soldiers of the Prophet who combined plunder with proselytism. Boikend blades, costly carpets, heaps of gold and silver, wondrous pearls extracted from the eye-sockets of Buddhist idols abhorred of every good Moslem, and even the jewelled slippers of the brave Queen Khatun herself, only served to convince the invaders more firmly of the pressing necessity of converting the infidel. But the infidel defended his faith and his goods with all his soul and with all his strength; till Kuteibe, about 710, dealt its death-blow to fire-worship, and firmly planted in Bokhara that Islamism which in later days, and as Mr. Vambéry has endeavoured to show in his earlier works, became, for cruelty and bigotry, almost unparalleled among the religions of the world. Kuteibe seems to have been the ideal of a Mahommedan warrior. He was equally at home in the pulpit and in the saddle; and he inspired his troops to deeds of desperate courage, no less by appeals to their lowest passions than to their pride as servants of God and the Prophet. For himself, his grand ambition was the conversion of Central Asia—a task to which he devoted himself with genuine enthusiasm. Arab troopers were lodged in every house to act as the religious instructors and spies of their hosts; by gifts in money infidels were encouraged to frequent the mosques; apostacy was punished with extreme severity, and, though "survivals" from the old worship were found even in the twelfth century, the history of Bokhara seems to confute the ordinary notion that a new religion cannot be imposed by force. The reader will discover that, at this as at other periods, popular energies

History of Bokhara; from the Earliest Period down to the Present. By Arminius Vambéry. London: King & Co. 1873.

were, by pressure of strong despotism, excluded from State questions to find vent in religious excitement. But of course, for some time, religious differences meant differences of race; hence the astonishing influence wielded by Mokanna, "the veiled prophet of Khorasan," to whom, no doubt, the reader has already been introduced in Moore's pages. He appeared on the scene in 767, and from his impregnable eyrie, near Kesh, for fifteen years defied the Caliph's best armies and generals. The story is one of the most interesting in the book; but we can only glance at it. The fire-worshippers were Mokanna's chief adherents, and he proclaimed himself a God incarnate who had already appeared in the persons of Moses, Mahomet, and Christ. Looking-glasses arranged so as to catch the sun's rays were the device whereby he once satisfied his worshippers praying to behold the glory of his countenance, and brought them to their knees in terror. It is narrated that an envoy, being asked by him who and what he was, bluntly replied that the question was unworthy of an omniscient deity; but Mr. Vambéry considers that the retort argues more courage than, under the circumstances, the envoy ought to be credited with. When all was over, Mokanna beheaded his page, poisoned his numerous wives, except one, and then leaped into a blazing furnace from which it appears he had promised to emerge with aid from heaven. The escaped lady told the Arabs that she had long watched the furnace, but that Mokanna never came back. The comparative mythologists perhaps might like to make short work of the story, or at least of part of it, by showing that, even if a real Mokanna did exist, the Mokanna of the shining face was a native of Cloudland, and meant the Sun, with its "golden mask," and "green veil," or clouds that hid its splendour.

At this time, and for about a hundred years more, "Middle Asia" formed part of the government of Khorasan, whose "statt-holder" sent a representative of the Caliph to reside at Bokhara, the descendants of the old dynasty retaining only the bare title. But the rule of the Arabs really ended with the ninth century, when Ismail, the most illustrious of the Samanides, received his diploma as governor of Khorasan. He possessed the right of coinage, and of the *Khuthe*—repetition of his prayers in his name; and, like the princes of mediæval Europe in their relation to the Pope, Ismail owed only a nominal—*i.e.* religious—allegiance to the Caliph, "the Shadow of God upon earth," who was rapidly becoming nothing but a shadow. Under this prince, Bokhara rose to be the capital of a great empire, and was renowned over Asia for its commercial prosperity, its colleges, to which students flocked from all parts, and its learned men and saints, whose names are revered even in the present day. The Samanide dynasty lasted for about a century and a half, after which the unhappy country continued to be an apple of discord for successive lines of Charesmian, Seljuk, and other Tartar rulers, till, in 1218, Ghenghiz Khan emerged from "the Gobi-Waste" with his half-million of Mongols. Mr. Vambéry describes in his best style how the brutal Mongols used the leaves of the Koran for horse-litter, and the book-chests for horse-troughs, and turned the priests into servants of all work; while Ghenghiz in one day reduced Bokhara to ashes, destroyed all traces of its old civilization, and sent its famous gardeners and skilled mechanics to ply their trade in Mongolia. The Mongols described by Gibbon, as well as by Mr. Vambéry, seem to be distinguished above all races for a certain kind of cold, gloomy ferocity. Ghenghiz Khan appears to have been pretty much like the rest of them; yet our author administers a whitewashing to the flint-hearted old savage, and quotes his Military Constitutions—"the Mongol Koran"—and his toleration of different religions as proofs that he had a turn for statesmanship as well as for booty and murder. A few details of these Constitutions are given in the excellent sketch of the career of Timur, who, we are told, was a great admirer of the Khan's system. But perhaps it would be difficult to prove that certain portions of this "Koran" actually belong to Ghenghiz, and not to Timur. Regulations for the outfit—in swords, axes, saws, needles, thread, &c.—of every trooper, were of course much after the great Khan's special tastes. But the rule that the cry for quarter should be respected seems inconsistent with the conduct of a man who would murder in cold blood recruits and prisoners disabled by sickness. Still a conqueror of the time practically summed up his ethics in the words, Whatever I do is right; and Ghenghiz could, without the least scruple, and with the most pious severity, lecture the Bokhariots on their sins, and then proceed to demonstrate God's wrath in the way most agreeable to himself. In this invasion Timur Melik, the Toorki governor of Khojend, distinguished himself in a manner worthy of record. He launched twelve boats, or monitors, as we might call them, on the Jaxartes, covered them with armour-plates of damp felt, to prevent their being set on fire, and fitted them with a sort of portholes, through which he treated his friend the enemy to a brisk fire of arrows.

With the rise of "Timur the Tartar"—1363 to 1405—Central Asia regained its old prosperity, and Samarcand, not Bokhara, became alike the capital of Asia and the seat of perhaps the most splendid and refined Court in the world. His Spanish Majesty was represented there by "the good knight" Don Ruy Gonzales de Clavijo, a fact to which Timur proudly directed his courtiers' attention when he spoke of "my son, the King of Spain, who dwells at the end of the world, and is chief among the Frankish kings." We think of some story of the *Arabian Nights* when we read the description by Clavijo of one of those festive days when, on a plain near Samarcand, an ordered city of many-coloured tents would spring up as if by magic—looking, in the distance, "like a bed of tulips swaying with the breeze"—in which Timur, his Court, and thousands of the citizens would for days luxuriate in wine-drinking, poetry, music, and the dance. Persons acquainted with Baber's Memoirs will perhaps regret that Mr. Vambéry has written so scantily on the Timurides, whose dynasty, though the most short-lived (lasting only till 1500), comprised the ablest and most accomplished princes that ever ruled beyond the Oxus. This reserve of energy is perhaps the chief fault to be found with Mr. Vambéry, and implies a compliment to which not every historian is entitled. The era of the Timurides is especially rich in materials from which a skilful composer might produce a tolerably complete and vivid picture of the society of the time, thus breaking the somewhat monotonous record of names, court intrigues, and bloodshed. But of the poets, philosophers, and theologians Mr. Vambéry has given us only brief notes, which, however, we hope will be amplified in a future edition of his book. Baber himself, whose Memoirs are here called "the Commentaries of the Cæsar of the East," and who is perhaps the finest character that Central Asia ever produced, offers a fitting subject for a sketch of a "representative man."

As in the case of Paraguay during recent times, so also in that of Central Asia, Nature had forgotten to provide for a constant supply of powerful and wise despots. It was only occasionally that a hero arose who, in Carlylean phrase, succeeded in making the country "habitable." But the good impetus always died with the dynasty itself, and then came the opportunity of tribes whose great enemy was peace; so that history had to be begun *de novo*. Sheibani, who with his Uzbegs—Turko-Mongols between the Arab and Caspian—expelled Baber in 1499, was a mere fighter, from whom the old civilization of Bokhara received a blow from which it never recovered. Under Abdullah Khan, the best of the Sheibanides, Bokhara recovered in a measure its old commercial and intellectual greatness; but it all disappeared with the ruler himself, and for more than two hundred and fifty years, during the reigns of princes whose very names are now made known to European readers for the first time, the history of Bokhara is one of steady decadence, and too often of unimaginable misery. Even the Mollas, who stood between the people and their tyrants, and whose sacred influence is illustrated in many a bright and impressive anecdote, appear in 1826-60 as contemptible panders to that "Shadow of God," Emir Nasrullah, whose character is perhaps the foulest and blackest in Central Asian records.

The concluding seventy pages are the most interesting in the book, and contain an excellent summary of the course of the Russian conquests till within the last few months. Bokhara presented a spectacle pleasant neither to gods nor men; and the reader cannot feel deeply touched by its fate when General Kaufmann, in May 1868, made his triumphal entry into the old capital of Timur, and wrote *finis* to its long and chequered history. Mr. Vambéry writes as an historian, not as a politician; but no reader can close these volumes without perceiving that, so far as the Central Asiatics are concerned, the Russian conquest must be regarded as a blessing; any rule is better than endless anarchy. We conclude with a cordial recommendation of this valuable book. In former years Mr. Vambéry gave ample proofs of his powers as an observant, easy, and vivid writer. In the present work his moderation, scholarship, insight, and occasionally very impressive style, have raised him to the dignity of an historian. Throughout it is written in the clearest and most flowing German; but we may refer readers unacquainted with that language to the very excellent English translation which has just been published, and with which no fault can be found except a few trifling instances of tame rendering and too close adherence to the form of the original.

MEMORIALS OF A QUIET LIFE.*

THE epithet "quiet," as characterizing the manner or subject-matter of a book, has lately come into vogue, its tone of self-complacent apology evidently recommending it to the author in search of a title. There is the flattery of selection in it; it is a hit at sensationalism. The quiet neighbourhood, the quiet heart, the quiet eye, the quiet memorial, all seem to demand a discerning reader, who can detect the vivid workings of thought and feeling under an outside tranquillity, and can distinguish between quietness and dulness, which are all one to thoughtless ignorance. But there is risk in it too. Two very thick volumes expended on the quiet life of a clergyman's widow unknown to fame might test even a steady reader's powers to the utmost. In fact, Mrs. Augustus Hare's life was not exceptionally quiet, whatever her habits may have been. She was married to a distinguished, and not at all quiet, husband; she knew a great many people, and she travelled a good deal. Not that these circumstances would account for the two thick volumes; but one thing about her was never at rest—her pen was endowed with a ceaseless activity. Its effusions are indeed enough to repel the glancing, skipping reader who believes he has trained his eye to the work of rapid abridgment. Impatient turning of the leaves produces only discouragement; but begin at the beginning, and the well-principled effort is rewarded by forming acquaintance with a really high-minded, unworldly, and intellectual group of people presenting a

* *Memorials of a Quiet Life.* 2 vols. By Augustus J. C. Hare. London: Strahan & Co. 1872.

picture of aims, pursuits, and habits which raise them sufficiently above ordinary folks and their doings to make them well worth knowing. We advise this course not only for its intrinsic merit, but on the rule which guided Mrs. Linnet in reading good books of biography. She, we are told, after one peep at the end to satisfy a somewhat morbid curiosity, would turn to the earlier facts in her subject's history, her eye passing quickly where serious phrases predominated, but being arrested by what are termed "promising nouns." It is in the first volume of most biographies that such "promising nouns" occur, and the book before us is no exception. The facts, incidents, adventures, stimulating names, and love-making come early in the story. Here we read of Miss Leycester's travels in Scotland with her brother in his gig; of her stay at Blair Athol; of the gig-box furnishing a dress which did no discredit to the Duchess's drawing-room, where Prince Leopold was guest; of her visit to Walter Scott; her report of his "insignificant little wife" and his "fine, sensible, clever daughters." In the first volume also the masculine element predominates. The reader already knows something of Augustus and Julius Hare, authors of *Guesses at Truth*, but here he sees them closer in their domestic relations, and it is their share in the work which gives it an especial value. At a time when the complaint is so general of young men's reluctance to choose the Church as their profession, and of the difficulty of parents knowing what to do with thoughtful, well-conducted sons who seem cut out for excellent curates and conspicuously not cut out for any other calling, has reached a point beyond all past experience, the picture of Augustus Hare as parish priest of Alton Barnes is really opportune. Here was a man just like what these respectable objectors fancy themselves, bright, clever, a good talker, with all the doubts and hesitations reaching at one point to positive "repugnance"—which go with the assumption of original thoughts and views; till fortunately the shock of his friend Martin Stow's death startled him with the question, "If I should die without being of any use!" under which all his doubts vanished. When once the step was taken, he plunged into the work with a fervour, unction, and success which really stir the reader's sympathies, keeping all his distinctive characteristics as clearly defined as ever; remaining as clever, as odd, as attractive to his friends as when a lay Fellow and tutor of New College, the centre of a distinguished circle.

An easy gift of expression is a characteristic of every prominent person in the book. The ladies' pens all run with a flow, a power of telling their inmost thoughts and imparting their tenderest feelings, of finding something fresh and ardent to say on what to their readers seem exhausted topics, which separates them from ordinary experience. But the Hare brothers were exuberant in another fashion. Augustus may be said to have expressed himself at every pore. Every feeling in his mind found instant vent in action of a violent kind:—

> "He was *very* eccentric" is the remark of almost all who knew him at this time. If excited in conversation, he would spring up in the midst of his talk, twist himself rapidly round three times, and sit down again without pausing in what he was saying, as if some external action was necessary to let off the force of his excitement. After dinner at the houses of his intimate friends he would walk up and down the drawing-room in the vehemence of his spirits, and then cast himself upon a sofa and throw up his legs in the air. . . .
>
> When Augustus Hare heard of any kind of noble action performed by another person, I have seen him suddenly start up from his chair with a strong exclamation of delight uttered in his shrill tone, and hurriedly pace the room, rubbing his hands with glee. He really felt a luxury in doing good. . . I remember being present at a supper which he gave to some old men in the barn already mentioned, where he assisted in waiting on the poor people, evidently enjoying the repast more than those who partook of it; and when the entertainment was over, and he returned to his own fireside, his first act was to run up to Mrs. Hare, and kiss her with an ecstacy of benevolence too big to be expressed.

These manners might have stood in his way in other professions, but nowhere does a vein of eccentricity fit in so well as in a country parsonage. The ideal rector, of liberal hand and easy means, is not complete without a few amiable oddities. They keep up freshness in his relations with his equals, and furnish his poorer parishioners with anecdotes. All people like their penetration to be kept in exercise, and credit for wit or learning or genius is more cheerfully bestowed where criticism is not wholly held in abeyance. Even a wife may feel this; his "twisting and twirling" are effervescences of genius pleasantly referred to in her correspondence. In spite of them the five years of married life at Alton Barnes are described by Mrs. Hare as years of unalloyed felicity. And here again—for we are bent on setting off the clerical calling at its brightest—the country rectory in good hands suggests an image of Paradise nowhere else to be conceived with the same fitness of analogy in all its parts. It is pleasant to read in these pages of unbroken happiness (acknowledged in its course as such) enjoyed in a life of ideal usefulness, even while we know that it cannot last, for it is only homes susceptible of a thousand improvements that hold their ground. Five years, however, of unalloyed felicity is a good spell.

Another model rectory after rather a different type is described earlier in the same volume. As a girl, Maria Leycester—Mrs. Augustus Hare—formed an intimate friendship with the Hebers, Hodnet being two miles from her father's living of Stoke-upon-Terne. Reginald Heber was a man who could at once enjoy and stand loose from the refined pleasures of life. His whole nature needed play. "While," Mr. Blunt wrote, "as an active parish priest he was daily among his parishioners, advising them in difficulties, comforting them in distress, kneeling often at the hazard of his life by their sick beds," we find Miss Leycester riding, one of his merry party, in the glades of Hawkstone, listening to his readings of Walter Scott's "newly published" novels, or to his recital of the *Ancient Mariner*, or singing his songs which he wrote "faster than we can sing them," and at Christmas time joining in the evening amusements of dancing, singing, acting:—

> Reginald Heber [she writes] and Mr. Stow are both excellent actors, and we acted a French *proverbe* one night, and the "Children in the Wood" another; forcing in ourselves both the performers and the audience, and very amusing it was. It was all extempore, and our dresses we got up in a few minutes at the time, so there was no trouble attending it, no spectators to alarm us, and perfect unanimity and good-humour to make it enjoyable.

The Mr. Stow here mentioned was the admirer first in Miss Leycester's good graces, and Augustus Hare, as his friend, did all he could to remove impediments out of the way. But her father's consent could not be won. Stow then went to India with Bishop Heber, and shortly after died of fever at Dacca. It was in mourning his death together that the deeper attachment was formed of which this work tells us the course and end. We cannot here enter into the history of the Hare family, or speak in detail of all the four members of the united brotherhood—Francis, the father of the biographer: Augustus, educated by his aunt Lady Jones; Julius, who passed much of his boyhood in Germany, where as a child he heard Goethe and Schiller talk, and, as he said, "learnt to throw inkstands at the Devil"; and Marcus, the youngest. They derived their genius and talents apparently from their mother Georgiana, daughter of Dr. Shipley, Bishop of St. Asaph. She was beautiful enough to rival her cousin, the beautiful Duchess of Devonshire; deeply learned, and an accomplished artist, receiving hints from Sir Joshua Reynolds, who visited at her father's house, and patronizing Flaxman. All the boys were born in Italy and had a different start in life and thought from the ordinary English boy, a difference which told upon them throughout. It was their mother's principle to give them unlimited range of books and authors. Julius, the "Hare with many friends," raved of German authors at Cambridge with family enthusiasm; and Augustus, before he left Winchester, constituted himself a reformer of its code. It must be noted, however, that he stood up for the system of prefects. He had entered the school a commoner, but was elected scholar in 1806, high enough in school to go into college as a prefect—an office which he could fairly would never abuse, and which, from the point of view of administrator, was congenial to his temper.

Hurstmonceaux, being a family living and a very good one, was to devolve upon Augustus; but he strenuously urged so warmly to his simple rustic parishioners that he [illegible] elder brother to promise it to Julius, who in fact accepted it when shortly afterwards it fell vacant. The story of Lady Jones's will shows disinterestedness in money matters, a family characteristic, while the reader moralizes on the wisdom of sitting loose from [illegible] cares when he notes how short a time was granted for the enjoyment of this world's best gifts. In 1833 Augustus Hare's health failed, and it was thought necessary for him to give up duty for a while, and resort for cure to his native air of Rome. His brother Marcus had just married Miss Lucy Stanley, Maria Hare's most intimate friend and correspondent, and they travelled together. As this elect and devout party enter Italy, Augustus reports their being announced by a postilion to a friend at the inn-door as "God-damns *della prematura qualità*." They reached Rome, but no cure followed, and he died there in February 1834 at the age of forty-one. The one drawback to her married life had been the want of children, and in the desolation of her widowhood Mrs. Hare—or Mia, as her friends called her—offered to adopt her godson Augustus, the infant child of the eldest brother Francis; stipulating that the child should be absolutely her own, and "should be brought up to consider all her family as its relations, as near or nearer than those who were related to it by blood." No opposition was made to her wishes, and, when fifteen months old, the child was formally made over to her.

It was this lady's fortune to be successively the supreme object of regard with many men. To Martin Stow succeeded Augustus Hare. At his death she made Hurstmonceaux Rectory her home, subsequently settling near it, where her brother-in-law, Julius Hare, devoted himself to her with an enthusiastic reverence, which lasted till his marriage, in 1844, with Miss Esther Maurice, sister of Frederic Maurice, who had been his pupil at Cambridge. At this time her adopted son was getting of age to return her affection, and from this date to her death in 1870 he was more than a son to her, a tender romance adding force to the maternal relation. The qualities which awoke a course of such lasting affection must have been of no common order; a certain dignity of self-respect no doubt tempered love with some awe of esteem. This is transparent in the style of her correspondents; an elevation of tone is maintained on all sides, with which it must be owned that the close of her life strangely harmonized. Six months before her death (in 1870, aged 72) she fell into a succession of trances, one lasting a hundred and twelve hours, during which she took "no nourishment whatever," lying in a state of seemingly ecstatic repose.

We have touched rather on the facts and prominent characters of the book; but its bulk is due to the letters and journals and meditations of Mrs. Hare and her friends, beginning with excellent letters of advice from her elder sister, who married, in 1810, the Rev. Edward Stanley, Rector of Alderley and subsequently Bishop of Norwich, and followed by a close, lifelong correspondence with

Lucy Stanley, sister, we gather, of the Bishop, and at length wife of Marcus Hare. All the letters are of a strictly religious character; these ladies profiting by the piety, and not disturbing themselves much about the views, of the liberal thinkers with whom they were connected. They were all observers of days, anniversaries, and seasons, as motives for the exercise of ever-fluent pens upon feelings awake to every influence from without. Each second of June as it comes round has its notices and reflections on the wedding of Augustus with his Mia; each eighteenth of February, year after year, brings its tribute of condolence; and as the wives all survived their husbands, and the system was mutual, this of itself constitutes a volume. So that we can scarcely echo Mr. Augustus J. C. Hare's regrets over the first step of Mrs. Julius Hare in her widowhood, of burning the daily minute correspondence which had taken place between "his mother" and Julius whenever she was away from Hurstmonceaux. We feel that nothing of her is left unsaid. Friends may regret, but the reader sees things under another light, and, while finding much to interest and something to learn in these volumes, certainly does not wish them to be longer.

RÉCLUS ON THE OCEAN, ATMOSPHERE, AND LIFE.*

UNFLAGGING in industry to the last, the late librarian to the Queen at Windsor left all but ready for press, besides other works of great literary value, a translation of the second portion of M. Reclus's comprehensive survey of the Life of the Globe, supplementary to the volume upon the *Earth* which we noticed a year and a half ago. We are glad to see this new and not less interesting contribution to the scientific history of our planet, *The Ocean, Atmosphere, and Life*, carried through the press with the same editorial care and completeness as the former book. The original work has from the first taken its place in its own country as a recognized manual in the study of physical geography. In our own educational literature we have nothing at all corresponding with it. It may in consequence be expected to fill a void in the course of physical teaching. M. Reclus not only shares with his countrymen in general the faculty of keen perception and symmetrical arrangement of facts, but displays to the full that art of vivid and picturesque exposition which gives to French science its crowning and most characteristic charm. The translator has throughout combined fidelity to the original text with freedom and flexibility of style. The accompanying maps, of which there are twenty-seven printed in colours, as well as the woodcuts inserted in the text, over two hundred in number, are, without claiming high artistic finish, clear and correctly drawn. They are borrowed, we presume, from the original publication, English names having been substituted, the process betraying itself by sundry casual slips, such as "Ocean Pacific," "Sea Baltic," "Gulfe Taranto," and so forth.

M. Reclus casts a broad glance over the general distribution of land and water over the globe. The depths now shrouded from sight by a veil of water once deemed unfathomable have, he urges, no less importance to the mind of the geologist than the exposed surface of the continents or islands. In the long range of geological time well nigh every portion we now see has had its turn beneath the waves, and will in all probability sink anew below their surface. So, it may be, have the now submerged abysses had their day of light and air, or may hereafter rise above the waste of waters which now hides them. Meanwhile the ocean never for a moment ceases to modify the configuration of the globe, not only by its wasting violence, but by the agency of its clouds, its rains, and meteoric influences at large. Manifold as are the atmospheric agencies by which the mountain summits are riven and worn down, the rocks dissolved and hollowed into caverns, bringing mineral substances to the surface, and causing at times great subterranean subsidences, it is the sea which sends them forth, and it is in the course of their return to the great basins where they had their rise, that the marine vapours penetrate and filter through, and disintegrate the land. What are the glaciers which polish the rocks, and carry down into the valleys those piled-up boulders, but moisture from the ocean, which the clouds deposit in the form of snow? What, too, are the numerous rivers which spread life over the globe, and without which the continents would be uninhabitable deserts, but a system of veins and veinlets which carry back to the reservoir of the ocean the waters distributed over the soil by the great arterial system of clouds and rain? As for climate, upon the varieties of which all that lives upon the earth depends, does it not follow from movements of the ocean, at least as much as from the distribution or elevation of the masses of land? The polar cold would be more rigorous, and the heat of the tropics more intense, to the destruction of most of the beings now inhabiting them, did not the currents of the ocean convey water from the Poles to the Equator, and from the Equator to the Poles, thus constantly tending to an equalization of temperature. It is thus no paradox that in the cosmogonies of many a primitive race, Earth is called the daughter of Ocean.

Were the bed of the deep sea suddenly upheaved before our eyes, what aspect would it present to us? M. Reclus is inclined to imagine that the submarine surface still preserves all its primitive rudeness—that its rocks, cliffs, and fells uniformly present sharp and uneven edges, the marks of fracture just as on the day when the solid rock was first cleft. "There are in the depths of the sea no frosts to break off projecting peaks, no lightnings to split, no glaciers to carry them or crumble them away, no meteoric influences to corrode and round them." He hardly dwells sufficiently, we may be sure, upon the solvent power inherent in water itself, apart from all consideration of its density and pressure, or upon the vast and ceaseless sedimentary deposits which clothe the primitive nakedness of the depths with their soft covering. Tracts there may be where, from the action of a submarine current, the rocky bed is not covered by any organic alluvium. Our author quotes the case of a fragment of quartz and several pieces of basalt having been drawn up by Wallich from a depth of more than six hundred fathoms in the deepest part of the great arm of the sea which separates the Faroe Islands from Great Britain. But it is quite possible, he allows, for these fragments to have been dropped by an iceberg. At the same time we may refer to the surprise which was felt, on the recovery of the Transatlantic cable, at the slight amount of coating which it had received in two years from the Atlantic ooze. The aspect of tracts which have emerged from under water at a comparatively recent epoch, such as the Landes of France, the lowlands which have replaced the Gulf of Poitou, a great part of the Sahara, or the Pampas of La Plata, gives indications of regular level or smooth undulating slope. With our utmost command of sounding apparatus it has hitherto been impossible to arrive at abrupt or extreme transitions of level at great depths, or to lay down with any precision a profile of submarine mountain heights. Tremendous fissures or depressions, together with steep elevations and ascents, have indeed been ascertained to exist, of which M. Reclus brings together notable examples from the charts of the Mediterranean, the Cape De Verde group, and the Malay Archipelago. If we can trust the soundings of Captain Ringgold, the ocean depth in the last-named instance is no less than eight miles and three-quarters. The abruptness of rise, however, in these sub-oceanic inclines does not in all probability vary very much from that of known terrestrial ranges.

The chemical composition and specific gravity of the various sea-basins have been subjected to very careful analysis. The mean weight of sea water is set down at 1,028, or 2·8 per cent. above that of distilled water. The intense evaporation of the Mediterranean raises the specific gravity of its waters to more than 1,029, while the copious fresh water discharges into the Black Sea lower its weight to 1,016. The latest observations of Forchhammer have fixed the average of all the salts in ocean water at 34·40 parts in 1,000, out of which the total quantity of common salt (chloride of sodium) held in solution amounts to more than three-quarters (75·786). M. Reclus gives a table of a dozen different seas, varying from 43 parts in 1,000 in the Red Sea, to five parts in the Baltic, and even as low as two parts off Kronstadt. The formation of "limans," or salt marshes and basins, is explained. Other substances besides common salt which are in many instances found in inland waters and hot springs enter also into the composition of sea water. Either by direct analysis of the liquid, or by study of the plants which draw their nourishment from the ocean, twenty-eight such simple elements have been discovered. After oxygen and hydrogen, which constitute the fluid mass itself, there come among these chlorine, nitrogen, carbon, bromine, iodine, fluorine, sulphur, phosphorus, silicon, sodium, potassium, boron (?), aluminium, magnesium, calcium, strontium, and barium. The ashes of *Fucus resiculosus* have yielded copper, lead, and zinc, and those of *Zostera marina* cobalt, nickel, and manganese. Iron is to be obtained directly by analysis of sea water, and arsenic is freely deposited in the boilers of ocean steamers. Silver is found in a zoophyte, the *Pocillopora*, as well as in the precipitate formed upon ships' copper sheathing under magnetic agency, to such an extent that the total mass of silver contained in the ocean has been estimated at two millions of tons. The proper colour of sea water, its various local or casual tints, with their causes, and its transparency at great depths, open a wide, and as yet indefinite, subject of inquiry; as does also the phosphorescence of its surface, and its connexion with the presence of living organisms, to which the author reverts in a later section on "The Earth and its Fauna," illustrating it by microscopic delineations of *foraminifera* dredged up from great ocean depths. The law of the distribution of temperature, scarcely more determinate as yet than that of the colour of the sea, is one which specially awaits the result of the scientific expedition just despatched from our shores. This portion of M. Reclus's speculations is in consequence one which must admits of being left in abeyance. On the formation of ice-floes and bergs, recent observations have brought us a large accession of definite knowledge. The actual launch of ponderous masses from the mighty glaciers of the Polar shores has been witnessed, and the tracks laid down (in charts such as those of either hemisphere sketched in figs. 13 and 17), by which these floating masses are borne along, to drop, as they finally must, their freight of rocky *débris*, the material, it may be, of banks like that of Newfoundland, over 55,000 square miles in extent, if not of whole continents yet to be.

The primary causes of oceanic currents are beyond doubt the sun's heat and the rotation of the earth on its axis. But so many secondary or local causes come in to affect the resulting phenomena, that, like the tides, they have been found as yet only partially reducible to definite laws. Not only the configuration of the land, but the great periodical wind currents, are elements to be taken into account in working out the general theory of ocean circulation. In this department of science much has to be

* *The Ocean, Atmosphere, and Life; being the Second Series of a Descriptive History of the Phenomena of the Life of the Globe.* By Elisée Reclus. Translated by the late B. B. Woodward, M.A., and Edited by Henry Woodward, F.R.S., of the British Museum. 2 vols. London: Chapman & Hall. 1873.

expected from the mission of the *Challenger*. In the meanwhile M. Reclus gives in his second book a succinct and clear account of what has been done both by practical observation and philosophical research towards laying at least the foundation of the problem.

The great equatorial basin heated by the solar rays gives off a quantity of watery vapour estimated by Maury at about fourteen feet annually, the amount raised from the Atlantic being nearly one hundred and twenty trillions of cubic yards, representing a cubic mass of water nearly thirty miles in extent. A great proportion of this water being carried away by the trade-winds and other aerial currents, notwithstanding that much of it falls back into the sea in the shape of rain, an immense void is made, into which rushes the superabundant mass of water from the polar basin, where the contributions of snow, rain, and ice, exceed the loss in vapour. Thus are formed the two great primary currents which meet one another from the opposite Poles in the Atlantic and Pacific, incessantly describing a regular orbit, like the celestial bodies. The steady flow of the great currents is moreover accelerated by the trade-winds, themselves set in motion by the equatorial heat, and driving before them the oceanic waves. Were the mass of water continually flowing from the Poles to the Equator exactly equal to that which is evaporated by the sun's heat, the Arctic currents would be arrested under the Tropics, and no return movement would be effected towards the Poles. But this equilibrium is overcome by the trade-winds: and in addition there is the rotary movement of the earth which bears the whole ocean mass from west to east. On their way to the Equator these waters have to cross latitudes whose speed of rotation is greater than their own, being thus constantly drawn obliquely towards the west, or in retardation of their proper motion, acquiring hence an apparent motion westwards in relation to the surface of the sea. Upon their meeting in the Tropics, the two Polar currents, being both affected by a side movement, strike each other obliquely, then reunite in the same oceanic flood, and flow directly towards the west in the direction opposed to the movement of the solid earth. The form of the continental masses determines the distribution of the great equatorial current into branches or ocean rivers, of which there are in the main five. The Atlantic and the Pacific have alike their double circulatory system, formed of two immense eddies, united in the torrid zone by a common equatorial current. The Indian Ocean, the fifth great oceanic river, being bounded on the north by the continent of Asia, has but one simple current, turning incessantly in its vast basin between Australia and Africa. Of all these ocean rivers the best known to us, and that which is of most importance to us, from its influence on our climate and on the development of our commerce, is that part of the North Atlantic current which has long been known as the Gulf Stream. The Gulf of Mexico plays, indeed, but a minor part in the action of this gigantic eddy, the history of which is almost identical with that of the entire North Atlantic Ocean; and in that sense exception may justly be taken to the name. The larger views of geographers embodied in M. Reclus's summary trace the relations of this stream to the main mass of the ocean, to the configuration of the continents and islands which determine its channel, and the atmospheric agencies which unite in giving it its beneficent influences; together with which will be found ample information upon the volume, the set, the temperature, and other particulars belonging to the waters of each branch of the Gulf Stream.

In his second part, on The Atmosphere and Meteorology, M. Reclus treats of the air as the agent of the vital circulation of the globe, passing on to the general phenomena of pressure, its diurnal and annual oscillation as represented by isobarometric lines, and the irregular variations which constitute the debateable or as yet scarcely invaded land of meteorology. The trade-winds and monsoons are shown to obey laws of circulation and equilibrium analogous to those of the denser oceanic currents. Of the two theories of Dove and Mühry accounting for the counter aerial current which sets in against the north-east trade-wind and glides below it in the direction of the Pole, the preference is given rightly to Mühry's view of the parallelism of the two currents, their similar curvature being due to the attraction exercised in the polar regions by the wind which descends towards the Equator, modified as it is by the effects of the earth's rotation. Fig. 106 gives a fair idea of the variation of the winter and summer trades over the continents of Africa and Europe, and fig. 107 extends the view to the trades and monsoons of the Atlantic. The law of storms, or aerial eddies or cyclones, set forth in a series of four chapters, forms one of the clearest and most valuable portions of M. Reclus's work. At the basis of this great discovery, the most vital safeguard that science has yet put into the hands of seamen, lies the primary fact of terrestrial rotation. The same cause determines the spiral movement of the great aerial tourbillon in the direction with watch hands in the south, and against watch hands in the northern hemisphere. The principle of continuity and harmony which science tends everywhere to establish in nature rules, indeed, throughout M. Reclus's whole treatment of natural phenomena. We have left ourselves no space for noticing the admirable chain of research and reasoning by which he draws out the plan of life upon the earth, with its successive stages of flora and fauna, culminating in man, his evolution and progress, and the influence with which he in turn reacts upon the earth. M. Reclus has, it is well known, what are called advanced ideas. His survey of the great mother earth inspires him with hopefulness for the time "when her sons shall have all embraced as brothers, and have succeeded in establishing the grand confederation of free nations." His untoward zeal in this direction was lately, to the distress of all friends of science, the means of bringing him into trouble. The beneficent weapons with which reason aims at securing freedom and happiness for all seem to have been inauspiciously allied with the violence of the barricade and torch of the Communist. We sincerely rejoiced when the French Government felt itself justified in showing leniency to so able and eminent a man, and we trust that, eschewing the angry strife or the tortuous ways of politics, he may devote himself to making the world the happier and the richer for those treasures of science which he is so well able to unfold.

MARCHMONT OF REDLANDS.*

MISS MAINE has made a decided advance in her present story. The first volume is in our opinion really impressive, and though the second and final volume is not equally satisfactory, the novel is one which engages our attention to the end. The cause of the inequality of the execution is obvious enough. In the opening scenes Miss Maine states a very interesting problem; but she is too amiable, or has not sufficient courage, to work out the natural solution. After placing her characters in a very striking situation, she does not, in our opinion at least, make the best of it. Many authors fail from a certain tender-heartedness to pursue their plot to a legitimate development; and we fear that Miss Maine is not an exception to the rule. She becomes so fond of her characters that she forgets that the most amiable and the most vigorous of imaginary heroes ought to be sacrificed without remorse to the exigencies of a novel. When a writer has created a lovely heroine, he often falls in love with her himself, and forgets that the only excuse for creating her at all is to crush her under the overwhelming force of circumstances, so as to exhibit the beauty of suffering. It would be wrong to torture a real person to death in order that we might be edified by the admirable sentiments which are evolved in the process; but the objection does not apply to the fictitious beings the final cause of whose imaginary existence is to contribute to our enjoyment. A novelist should be as pitiless to the creations of his fancy as fate is pitiless to real human creatures; and a little untimely compassion has spoilt the interest of a good many otherwise excellent novels. To illustrate this principle we will state very shortly the main facts related in *Marchmont of Redlands*.

Isabel Home is a beautiful and engaging young lady. She is full of sentiment and imagination, and, in short, is a thoroughly feminine person, with whom any intelligent young man would do well to fall head over ears in love. Isabel lives with her father, a shrewd and rather proud Scotch squire. She has been engaged almost since her childhood to Harry Graham, a rather lazy young gentleman, the son of Mr. Home's oldest friend and neighbour. The young couple are not very passionately in love, but are content to accept their engagement as a convenient and in every way respectable arrangement. Whilst the family are staying on the Lake of Como, on their return from an Italian tour, they accidentally fall in with Charley Marchmont, the young man who gives his name to the novel. Now Mr. Marchmont is in many respects a very attractive youth. He is not much more energetic than Harry Graham, Isabel's affianced lover. But, on the other hand, he is very handsome; he has a beautiful voice and a strong natural taste for music; and he has wonderful dreamy eyes which are apt to impress themselves upon the feminine imagination. It is not strange that Isabel finds herself attracted to this romantic youth, in spite of her previous engagement. In fact, she very rapidly begins to discover that she is really falling in love for the first time in her life. Nothing can be more natural for a sentimental young lady staying on the Lake of Como in the society of a romantic young gentleman. But Mr. Marchmont has a mystery hanging about him. Those dreamy eyes of his utter unspeakable and not altogether agreeable things. In fact, for we must reveal the secret, they are illuminated by hereditary madness. The poor lad has already been once distinctly out of his mind; and, although he is for the moment perfectly sane, he is aware that the ancestral curse is hanging over him, and may descend at any moment. His doctors have told him that it is essential to his sanity that he should lead a quiet life and keep as free from excitement as possible. Of course under these circumstances he seizes the first opportunity of falling in love with a young lady already engaged to somebody else. But what is he to do? He is attended by a kind of external conscience, a certain excellent Major Vaughan, the very soul of honour, who always addresses poor Marchmont as "dear boy," and is in return always addressed by him as "old man." Major Vaughan speedily detects the symptoms of an approaching attack of violent falling in love. Moreover, being the soul of honour, he gives the only possible advice to his young friend, and recommends him to follow the excellent precedent set by Colonel Newcome in his only campaign story, and to run away. Circumstances, however, as they are bound to do, frustrate this excellent counsel, and Mr. Marchmont finds himself making a declaration to Isabel, though, with praiseworthy honesty, he informs her at the same time of his tendency to insanity. Here, then, is a very pretty complication. What is Miss Isabel to do? We must not blame her too severely if,

* *Marchmont of Redlands*. By E. S. Maine. London: Smith, Elder, & Co. 1872.

partly out of compassion, and by way of sparing Mr. Marchmont any unnecessary excitement, she accepts the new love before she is off with the old. Many gushing young ladies have thought the bad character of a lover a reason for marrying him, with a view to post-nuptial reform; and surely it is a legitimate proceeding to marry a gentleman to prevent his going mad. Indeed Mr. Marchmont ingeniously insinuates the argument that the excitement of a refusal would go far to upset his sanity, and the lady shrinks from exposing him to such a shock. She goes yet a step further. She feels that her father would forbid the connexion; and she therefore agrees to a clandestine marriage. She even suffers her first lover to continue under the delusion that she means to marry him, and looks on, though with some disapproval, whilst her second lover treacherously takes advantage of his friendship with the first to arrange interviews and to prepare for an elopement. Finally, without having given the slightest intimation of her purpose to her father, mother, or the gentleman to whom she is engaged, Isabel calmly walks into Kensington Church one morning, marries her half-sane lover, and goes off with him to his country house; for Mr. Marchmont is a rich country gentleman and, in every respect but his tendency to madness, a highly desirable match.

This, then, is the statement of the problem; and so far we are very much interested, and have little to say that is not in praise of the story. But how should the consequences be worked out? That the novel must have something of a tragic termination is obvious. After our feelings have been worked upon by descriptions of the curse which is to fall upon poor Marchmont, it is plain that he cannot be let off. Moreover, he has been guilty of distinctly dishonourable conduct in inducing Isabel to marry him; he perhaps deserves some negative credit for not concealing from her his hereditary tendency, although the confession was requisite in order to explain the necessity for a clandestine match. But he clearly had no business to marry at all, and he had no business to behave with duplicity towards his rival. Mr. Marchmont therefore deserves capital punishment, by all the laws which regulate the world of fiction. Isabel, though less guilty, must share his fate. Having with her eyes open linked herself to the fortunes of a man who is in so tragic a situation, she must suffer equally. We do not say that she deserves a capital sentence, but at least she should be sentenced to penal servitude for life; or, in the accustomed phraseology of novelists, she should be dismissed on the last page to live very unhappily ever afterwards. These are, in our opinion, essential conditions of the story. To bring it to a happy ending would be as absurd as to tack to *Hamlet* a catastrophe like that of *Measure for Measure*, and let the curtain fall upon general forgiveness and a collection of happy couples, instead of horror and a row of dead bodies. We can easily imagine how the situation would have been treated by a writer of the school of Miss Brontë. The awful shadow of madness which darkens the earlier pages of the story would gradually have grown blacker and deeper, and the poor lady in her lonely house, with a husband becoming daily more dangerous and excitable, would have drunk her cup of horror to the dregs. We can dimly imagine the scenes which would have thrilled our senses —how a dark suspicion would creep forth at intervals, to be forcibly suppressed for a time; how it would steadily grow darker and more tangible in spite of every temporary success in beating it back; and how at last it would flash into terrible certainty, and some grim catastrophe wind up the book, and the life of at least Mr. Marchmont. The lady would have been doomed to expiate her errors by becoming the guardian of a lunatic all the more dangerous because the secret of his madness would require careful concealment. If her own sanity had not given way under the strain, at least her nerves must have permanently broken down, and nothing but a maimed existence have been henceforth possible. The horrors of her situation would have been increased by the alienation of her father, who was naturally disgusted with the man who had stolen his daughter from him; and something would have been made of the devoted friend of the husband, who did his best to prevent the match at first, and afterwards was distracted between his old regard for the poor half-lunatic and his extreme disapproval of the marriage.

Now Miss Maine is aware of these sources of interest, and, to some extent, turns them to account. The father grumbles at the match, and refuses to see his son-in-law; but somehow he fails very much to impress us. He is intended to be a reserved but deeply affectionate Scotchman, whose external manners are cold, but who is capable of strong passions when aroused. He therefore takes the affair rather quietly at first, and we look out for the subsequent outbreak. Unluckily it never comes, and Mr. Home is left to act the part of sulky father in a very wooden manner until the end of the story. Major Vaughan too, the soul of honour of whom we have spoken, rather disappoints us in the same way. He melts too speedily and with too few pangs of self-reproach. That he should forgive his young friend is right enough, but he takes matters rather too easily, and assumes at once the ordinary position of a sensible friend of the family. The half-mad Mr. Marchmont is supposed to feel a certain jealousy of his Mentor's relations to his wife. Nothing can be more natural and more characteristic of an intellect wavering on the verge of sanity. But Miss Maine becomes too fond of her madman to allow the passion to run its natural course. From sheer excess of amiable feeling, she makes Mr. Marchmont, after showing the dispositions to jealousy and to deceitful cunning which are characteristic of a lunatic, behave in all practical matters with the utmost delicacy and kindness. He is pathetic rather after the fashion of an ordinary mortal who is conscious that heart disease or consumption will shorten his life than of a man of partially disordered intellect. He tries, it is true, to drown himself on one occasion; but he makes the attempt out of pure kindness to his wife and friend, and we are inclined to agree with Major Vaughan's conclusion that the poor young man was never more sane in his life. Isabel again suffers, as she could hardly help suffering, from her doubts of her husband's sanity; but she has no very great agony to go through. The husband indulges in no overt acts of a very questionable kind; and everybody behaves with so much kindness and consideration that the awful prospect before her seems rather to be an inconvenience than a cause for harrowing anxiety. When the catastrophe finally occurs, it results rather from an interposition of Providence than from the natural development of the elements of danger provided. Mr. Marchmont has not yet become dangerous, or even distinctly disagreeable, when he breaks his neck in riding over an awkward fence; and the knot is immediately cut. Of course it is unpleasant for his wife, but we feel that she has been let off rather easily, and we take leave of her at the end of the novel very contentedly acting the part of an amiable aunt, and not without some indirect intimations leading us to suppose that she may ultimately marry again, and forget, so far as it is desirable that she should forget, the anxieties of her married life. We must confess that all this rather disappoints us, and seems to provide a somewhat lame and impotent conclusion to the most serious interest of the opening part of the story. The trial for which we have been so carefully prepared turns out to be much more endurable than we had supposed; and folly, deceit, and ill-regulated passion lead to nothing very terrible. But for the accident in the hunting-field the lady and her husband might apparently have ended by enjoying themselves very heartily. If we could regard the story as still unpublished, we should recommend Miss Maine to rewrite the second volume, and bring the conclusion a little more into harmony with the opening. As it is, we can only say that it is lively and well written, and that the merits of the first half incline us to hope that Miss Maine may improve still further in her next attempt.

WICKS'S BRITISH CONSTITUTION AND GOVERNMENT.*

WE watch with some curiosity the large class of books which seem to be called into being by the new Education Act. The present is one of the number. It describes itself in its title-page as "A Reading and Lesson Book for Senior Classes," and as "suitable for the Fourth and higher Standards of the Code." If so, the Fourth and higher Standards of the Code rank decidedly higher than the wonderful class of people, whoever they are, for whom Competitive Geographies and all other Competitive cram-books are written. We do not mean that Mr. Wicks's book is at all the sort of thing that we should really wish to see; but he is by no means so silly and blundering as the Competitive people. Of course no real good will be done till either thorough scholars condescend, as in some subjects they are beginning to do, to write elementary books on their own subjects, or at least till the compilers learn to keep up with the last lights of scholars, instead of lagging, as they commonly do, two or three generations behind. Thus Mr. Wicks gives us as his fifteenth chapter, "A Brief Sketch of the Growth of the Constitution," and adds:—

> Upon all controverted points dealt with in this chapter the conclusions of Hallam are adopted; and the student who desires to pursue the subject is referred to the eighth and ninth chapters of his "View of the State of Europe in the Middle Ages," and to his "Constitutional History of England."

Now, had Mr. Wicks written forty, or even thirty years ago, nothing could have been better; indeed, for a large part of the subject, nothing could be better now. No one guide is so thoroughly trustworthy as Hallam during the time, say, from Edward the First onwards, which Hallam thoroughly understood. Hallam, within this range, is one of the few writers to whom it is safe to turn if we want to find out a thing in a trice, when there is no time to hunt it up in the original authorities. Whatever we find—and we shall sometimes find an incapacity to grasp some views of the subject—we shall find no unfairness and no blunders. We say, of course, within his own range, for there are parts of Hallam which seem not to represent any original work at all, and which are of very little value. We should not speak thus of Hallam's treatment of the early English history, for it represents the very best work that was to be had at the time, though that is a time which the researches of modern scholarship, German and English, have left altogether behind. But Mr. Wicks will have Hallam, and nothing but Hallam: to him the discoveries of modern scholars would most likely seem "controverted points," on which it saves trouble to adopt Hallam's "conclusions," though Hallam can hardly be said to have formed conclusions on points which were never really discussed till after his time. It follows therefore that all the early part of Mr. Wicks's Constitutional History, whether suitable or not to the Fourth and higher Standards of the Code, is quite behind the standard of modern scholarship. It might

* *The British Constitution and Government: a Description of the Way in which the Laws of England are made and administered, together with an Account of the Functions of the Chief Officers in every Department of the State, and a Brief Sketch of the Growth of the Constitution.* By Frederick Wicks. London: Collings & Appleton. 1872.

easily have been much worse; we have seen many things of the kind that are much worse: because Mr. Wicks has at least taken Hallam for his guide, while many other compilers have taken much worse guides, or no guides at all. What we most complain of is that Mr. Wicks is, after all, not satisfied with his Hallam. If Hallam was not—as how should he be?—up to the lights of the generations which have come up since his time, he had at least too much sense to write a heap of stuff about Phœnicians, Britons, and Romans, as any part of the history of the English Constitution. Hallam begins with what he—pardonably, in his day—calls "The Saxon Heptarchy;" nothing before. This is not far enough back for Mr. Wicks; he must needs go back to Herodotus and the Cassiterides; and anybody would think, from his account, that Herodotus talked about England, if not about Britain. And so we go on with the regular sort of thing; every care being taken to confound Britons and Englishmen, which Hallam certainly never taught any one to do.

The later part of the historical sketch, where Mr. Wicks does for the most part follow Hallam, and perhaps for that reason cuts things mighty short after 1688, is fairly enough done, and it has the great merit of being quite clear from nonsense and fine writing. We may say the same of by far the greater part of the first fourteen chapters, which give a straightforward and sensible and commonly accurate account of the Constitution, the different branches of government and their working, of the theory and the practice of each. The chapters on the Crown, the Cabinet, the Houses of Parliament, and all matters of that kind, are fairly done, and several matters are explained about which there are popular misconceptions. It is, for instance, quite necessary to explain that the principal Secretaries of State are all alike the principal Secretaries of State, and that the division of particular branches among them—Home Office, Foreign Office, and so forth—is simply matter of convenience. This distinction of course was a very practical one as long as a seat in Parliament was vacated by change in office as well as by acceptance of office. That is to say, if the Home Secretary was made Chancellor of the Exchequer, he vacated his seat, because he had been appointed to a new office; but if he became Foreign Secretary, he did not vacate his seat, because in the eye of the law he still held the same office which he did before. So, if there are people who fancy that anybody is called Right Honourable because he is a member of the "Government" or the "Ministry," it is well for Mr. Wicks to explain that it is being a Privy Councillor which makes a man Right Honourable, and to set forth what cannot be too clearly set forth, that the "Government" or the "Ministry" is a body of which the law knows nothing. We do not say that Mr. Wicks has brought this out with all the fulness and clearness with which it would be well to bring it out; for it is really the conventional nature of that system of unwritten understandings which we call the Constitution as distinguished from the Law, that is really at the root of the matter. The peculiar and very delicate relations which exist between the "Government," the two Houses of Parliament, and the country at large, derive all their virtue from being unwritten understandings which have been worked into a particular shape, and may be worked into some other shape, just as circumstances may make it needful. The whole beauty and flexibility of the thing would be gone if the Cabinet should ever become a body defined by law. Mr. Wicks has a good enough chapter on the responsibility of Ministers, though some of these points might perhaps be more forcibly set forth. But he should hardly say, when describing the process and effects of a vote of want of confidence in a Ministry passed by the House of Commons, "This is called a Ministerial crisis and the motion a motion of want of confidence." Any one might think from this that "Ministerial crisis" was a real name. A motion of want of confidence is all right enough, because those words, or words to that effect, may very likely be the real terms of the motion, but "Ministerial crisis" is mere slang, just like "question," "tragedy," or "catastrophe." With all this part relating to Ministerial and Parliamentary matters as at present understood, Mr. Wicks has evidently taken great pains, and if the senior classes for whom his book is meant as a reading and lesson book get it thoroughly up, it will be all the better for them.

But, while Mr. Wicks is thus far successful as regards the present state of the general administration of the country, he treads on much less firm ground when he gets into the past, by no means a distant past, or when he gets away from the general into the local administration of the country. Here, for instance, is a piece of history which has puzzled us a good deal:—

> Some think it very singular that such officials as these—the Master of the Horse and the Mistress of the Robes, for instance—should go out of office with the Prime Minister; but it is held by very high authorities that these officers, who hold in some cases almost daily intercourse with the Sovereign, might exercise such influence over the King or Queen, or both, as materially to interfere with the advice given by the more responsible minister, and thus prevent good government. The Duke of Wellington felt this so strongly that when, in 1828, he was required by the King to form an administration, he declined the responsibility, unless he was allowed to appoint the Mistress of the Robes to the Queen. The point was conceded, but as the Duke had no objection to the lady who formerly held the office returning to it, he advised his Majesty to reappoint her. The Duke of Wellington foresaw that, although there was little probability of the lady who then held the office of Mistress of the Robes interfering with the counsels of the King, it might not be so at some time in the future, when it would perhaps be more difficult to correct the evil.

Now, as we are writing in 1873, we naturally know less about the year 1828 than about either earlier or later times. But we cannot understand how there could have been any question in that year about the office of Mistress of the Robes to the Queen. Whether the wardrobe of the First Gentleman in Europe anyhow needed a Mistress of the Robes to look after it, we are not courtiers enough even to guess. But surely, wonderful as the confusion seems to be, Mr. Wicks must have somehow mixed up the formation of the Duke of Wellington's Ministry in 1828 with Sir Robert Peel's attempt to form a Ministry in 1839, which, as all the world knows, failed because of what was called the Bedchamber Question. So again, to go further back, read in the account of the Treasury:—

> Formerly the chief of the department was styled the Lord High Treasurer, but in 1612 it was thought advisable to place the office in commission, that is, to distribute the duties and responsibilities of the office among several persons, who are styled Lords Commissioners of Her Majesty's Treasury.

And again, speaking of the Admiralty:—

> But the office of Lord High Admiral also, like the office of Lord High Treasurer, was in 1688 put into commission, that is to say, the duties of the office were distributed among several persons, who are called Lords Commissioners of the Admiralty. They are five in number, including the First Lord.

Does Mr. Wicks really think that there has been no Lord High Admiral since 1688; and, more wonderful still, no Lord High Treasurer since 1612? After this it is perhaps hardly needful to say that Mr. Wicks, when talking about the law of succession to the Crown, would have done better not to run the risk of cutting his fingers with the law of the Salian Franks. And, to come back a bit to our own times, considering that Sir John Coleridge is not Lord Chancellor, there is something funny about the following statement:—

> The office of Attorney-General, though of great dignity and importance of itself, is of still greater importance when regarded as a stepping stone to higher office. Whenever the Lord Chancellorship becomes vacant by any occurrence other than a change of Government, the appointment is usually offered to the Attorney-General, who by custom also expects the first offer of any position among the judges that may become vacant during his term of office.

When we come to local matters, Mr. Wicks gets a little queer. Perhaps his ideas are "metropolitan," and he may despise "the provinces." The English Justice of the Peace, "worthy gentleman," as he doubtless is, will hardly know himself in Mr. Wicks's picture:—

> County Justices are now appointed by Commission, from among the most worthy gentlemen resident in the county in which they have jurisdiction. Their powers, which are various and include the levying of rates for the maintenance of the highway, are all set forth in Acts of Parliament constituting them authorities in the matters they administer, but their most important duty is still the preservation of good order in their respective neighbourhoods and the dispensing of justice. For the latter purpose they sit at stated times to hear and decide complaints, to consider charges against persons brought up in the custody of the police, to commit them to prison in certain cases of small degree, or to await trial by a superior Court in graver cases.

We never heard of the worthy gentlemen in question levying rates for the repair of the highway. But Mr. Wicks tells us so again in another place:—

> In the counties, the Justices of the Peace appoint and control the county police, maintain the prisons, prosecute suppose offenders, and in most cases keep the highways in repair. The custom by which the Justices, who are appointed by the Crown, levy rates and expend the revenue so raised, forms the single exception to the Constitutional rule that taxation should go hand in hand with representation.

Mr. Wicks gives no clear account of Petty Sessions, Quarter Sessions, Boards of Guardians, Highway Boards, or any other matters of the kind, anywhere except in "the metropolis." "Provincial Corporations" he does condescend to. A Grand Jury, we are told, "is usually composed of men occupying a somewhat higher position in life than common jurors." Sessions and Assizes seem to be much the same to Mr. Wicks, and it would perhaps be dangerous to tell him that, according to a great authority, Grand Jurors ought to be taken from among "gentlemen of the best figure in the county." Such a description might haply have suggested to an unsophisticated mind the notion that Grand Jurors are chosen καλλιστινδην, like King Saul.

As we have often to say, we are thankful for small mercies and we do not despise the day of small things. So we do honour to Mr. Wicks, because his book might easily have been worse. But surely, if such beings as compilers must be, they might take some little pains to keep up with the march of knowledge in their own times.

THE GALLICAN CHURCH.*

FRANCE has long prided herself, and not without reason, on her title of "the eldest daughter of the Church." For some five centuries, from the beginning of the Avignon "captivity" to the Revolution, the Gallican Church was the chief factor in the religious history of Western Christendom. And even in the deep decline of her later days, since her "liberties" were trampled in the dust by the joint action of Pope and Emperor in the Concordat of 1801, and a mere shadow of her former self survived, it is still to the French clergy and the French episcopate that we must look for such scattered sparks of independent intellectual life as had not been wholly crushed out under the dead weight of Ultramontane despotism. It is true indeed that the Ultramon-

* *A History of the Church of France, from the Concordat of Bologna, A.D. 1516, to the Revolution.* By Rev. W. H. Jervis, M.A. 2 vols. London: John Murray. 1872.

tane reaction of the present century owes its first impulse and its position in the world of thought to French writers like De Maistre and Lamennais, but that reaction was itself originally a protest against a civil tyranny in Church matters which had ceased to be either religious or respectable. And we see in the final rebellion of Lamennais, and the indignant recoil of Montalembert from the once cherished "idol of the Vatican," how little its early leaders had foreseen the tendency of their brilliant but paradoxical speculations. There are then abundant reasons why students of ecclesiastical history should turn with peculiar interest to the history of the Church of France, and the fact referred to by Mr. Jervis, that no connected work on the subject was to be found in our language, would be certainly remarkable were it not also true that until of late years we had no Church historian at all to refer to except Gibbon, and even now are too often constrained to supplement the picturesque narrative of Milman by translations of Neander, or Döllinger, or Gieseler. And, accordingly, vague notions and detached scraps of information about the Gallican Liberties, or the Port-Royalists, or the Huguenots, make up the sum of what the majority even of well-educated Englishmen know about the Church of Pascal and Fénelon and Bossuet. It is this deficiency in our literature which Mr. Jervis has set himself to supply, and, we may say at the outset, with very considerable success. He combines the separable, and not unfrequently separate, qualifications of an historian and a divine, and is thus able to trace the doctrinal as well as the chronological sequence of the phenomena under review: and this is no unimportant point in dealing with a period which includes, to go no further, the vexed questions of Gallicanism, Jansenism, and Quietism. And he writes with that keen interest in his subject which we agree with him in thinking is consistent with impartiality, but not with indifference, and which is unquestionably essential to any effective treatment. It is certainly not necessary for an impartial writer "to have no fixed principles, or to seek to conceal them," so long only as he does not allow his predilections to warp his critical judgment. Any one, for instance, who has compared Thirlwall's History of Greece with Grote's will readily appreciate the difference between a learned, able, and impartial work, which is nevertheless too colourless to leave any vivid impression on the memory, and a work at least equally learned, and in the main quite as trustworthy, but which derives from the pronounced political principles of the writer a dramatic unity and force, so to speak, which arrest the reader's attention, and secure for the leading facts a permanent lodgment in his mind. We do not say that Mr. Jervis is another Grote, but we do say that he has for the first time presented the history of the later French Church as a connected whole in an English dress, and with a mastery of detail and power of grouping and of graphic narration which completely carry the reader along with him throughout, and cannot fail to be most serviceable to the student. He has had not only the copious treasures of French literature in ecclesiastical history, biography, and antiquities to draw from, but also two vast collections bearing the stamp of official authority—the *Recueil des actes, titres, et mémoires concernant les affaires du clergé de France*, comprised under six heads, and extending from 1645 to 1771, and the *Collection des procès-verbaux des assemblées générales du clergé de France*, extending from 1560 to 1786. Of the principle on which he conceives Church history should be written—and which indeed applies in the main to all history—we will let him speak for himself, the more so as the passage is also a fair specimen of his ordinary style:—

> Yet the eclectic mode of dealing with Church history, in sections capriciously detached from their context, is always attended with more or less disadvantage. It is questionable whether the events of any given passage of the Church's life can be rightly interpreted except in connexion with the lessons and experience both of antecedent and of subsequent times. All Christian ages are intensely cognate. The history of any one of them demands, as its full complement and ultimate elucidation, the history of all. If the law of continuity—the mysterious concatenation of cause and effect—be a recognized principle in the world of nature, much more does it reign supreme over the Spiritual Economy. Inmundane concerns its precise operation must often be matter of uncertain speculation. Human institutions vary with the "spirit of the age"; and it is not always easy to account for the fluctuations of that extremely volatile and fugitive element in the history of nations. Political dynasties rise and fall; one race succeeds another on the proud pinnacle of earthly domination; art and science, philosophy and literature, social refinement, industrial enterprise, military prestige, migrate from clime to clime, sink and decay, revive and flourish—by steps which in all cases are difficult to analyse, and in some are so obscure as to elude investigation. But the organization of the Church is Divine and changeless. Its external polity, its doctrine, its laws, its ordinances, as they were received in the days *e.g.* of Augustine or Gregory the Great, are no mere matters of curiosity for the antiquary or of criticism for the scholar, but matters of universal interest, facts of ever-enduring moment, decisions for all time. The threefold cord of continuity—continuity (1) of government, (2) of doctrinal faith, (3) of Sacramental Grace—may be said to constitute the "philosophy" of Christian history. To this normal law of its being, to this vital interpretative principle, all the multiform details of the Church's action may be referred. This is the secret of its marvellous strength; the sufficient explanation of its mightiest triumphs.

It will of course be remembered that Mr. Jervis is not writing a History of France, but of the French Church, and this sufficiently accounts for his passing almost *sicco pede* over many points which would otherwise have demanded complete and careful treatment. Thus, for instance, very little is said of the general principles of Richelieu's or Mazarin's policy, or of the League, or of the attitude of Sixtus V. towards it and towards Henry IV.—this last point, we think, might with advantage have been further dwelt upon—while the wars of the Fronde, and the part De Retz played in them, are dismissed in a few lines. There is nothing to find fault with here. Even those who insist with Dean Stanley that ecclesiastical and secular history simply mean the same subject looked at from different sides, must admit that, for any adequate understanding, the two aspects require separate treatment. It would be as much out of place to discuss wars and political intrigues at length in a work like the present as to enter into an elaborate investigation of the theological merits of Jansenism and Quietism in an ordinary History of France. The period selected by Mr. Jervis extends virtually from the beginning of the Reformation to the Revolution, but he has prefixed an important introductory chapter, which must by no means be skipped in reading, on the previous history of the Gallican Church. And it is here that the origin and true significance of what is called "Gallicanism" is most directly expounded. Like many other terms ending in "ism," it is susceptible of more senses, than one. It may be interpreted merely as denoting the principle of national and episcopal independence in the Church, within the limits of canon law and visible intercommunion, as contrasted with the Roman system of centralized despotism; and in this sense it is true to say that Gallicanism is an appeal to the discipline of the ancient Church. But the word at least connotes something more than this, and the author is not going too far when he speaks of it as "the Christianity of the French people." In its later and more distinctive phase it was something not only essentially French, but inseparably bound up with the existing political *régime* of France, and for that reason, if for no other, it fell once for all with the Bourbon monarchy. The divine right which was claimed by our own Caroline divines for the Stuarts was not less expressly vindicated by the contemporary school of French theologians, or less imperiously exercised by their sovereigns. "Whatever was wrested from the Pope," says Mr. Jervis—truly enough if that period be referred to—"was appropriated to the Crown," and thus the favourite Ultramontane taunt about Gallican liberties being really "Gallican servitudes" has a side of truth. "The Pope had enslaved the Councils of the Church; the Crown suppressed them." We may notice some examples of this by and by, but meanwhile it is necessary to insist on the distinction, because the word Gallican is not unfrequently applied with ignorant or studied inaccuracy to parties and principles which have little in common with it. There is an obvious convenience from the Ultramontane point of view in attempting to saddle the Liberal Catholics of the present day with a nickname which suggests at once the insinuation of Erastianism and of failure, and which is wholly inadequate, even where it is not an anachronism. In a broad sense, no doubt, "the Gallican Church was always Gallican," and may some day become Gallican again; but in the special and complex sense of the Pragmatic Sanction and the Declaration of 1682, and the ecclesiastical policy of Louis XIV., Gallicanism was the result of a combination of social and political conditions peculiar to the age and country, which can never be expected to return. How that state of things grew up may be learnt from Mr. Jervis's introduction. One passage, referring immediately to the Council of Pisa, we quote, as putting clearly and succinctly the fundamental position common to Gallicanism, in the widest sense of the word, with ancient Christianity and the so-called Liberal Catholic school of to-day:—

> The remedy proposed was that of appeal to a General Council, *as* the supreme tribunal of Christendom—competent, should the necessity arise, to pass judgment even on the Pope himself. This is commonly quoted as one of the peculiar principles of Gallicanism; but in point of fact it is an original constitutional law of the Church Catholic. It was not contended, even by the strictest Gallicans, that the Church ought to be governed, under ordinary circumstances, by a succession of General Councils; but that such a legitimate method of final decision existed, and that the schism was an emergency which justified and necessitated its application. The Church possessed, by the charter of her Divine foundation, powers which had been granted for the express purpose of preserving her organic unity; and if she had hitherto forborne to exercise those powers under the existing calamity, it was all the more important that they should not be suffered to fall into further disuse and oblivion, while every day was adding to the inveteracy of the evils which they were designed to counteract.

We cannot, of course, undertake here to follow our author through three centuries of Church history, embracing, besides much else, such multifarious topics as the Council of Trent, the character and treatment of French Protestantism, the contest about the Crown ending in the conversion and accession of Henry IV., the ecclesiastical policy of Richelieu, the entire Jansenist episode, and the leading incidents of the Revolution in their bearing on the Church. Without agreeing with him in every particular, we think he has throughout shown a real mastery of his subject; and occasional inaccuracies of detail—as where the Feast of Corpus Christi is spoken of as "recently instituted" in 1562, just three centuries after its first institution, and when for fully two centuries and a half it had been universally observed—are to be looked for in every writer. It is to his handling of the great Jansenist controversy, which in its successive stages occupies a very considerable portion of the work, that a critic would most naturally turn as the crucial test of Mr. Jervis's competence for the task he has undertaken. On the whole it is admirable, but we think that his evident bias, not only against Jansenist theology—in which he will find many to sympathize with him, both Catholics and Protestants—but against the Jansenist party, has now and then led him into an unfair estimate (never, so far as we have observed, a mis-statement) of facts, though he holds Fénelon's attitude towards the Jansenists to be the true one, who disliked their doctrines but always treated them personally with such marked kindness that, when persecuted elsewhere, they flocked into his diocese. We do not think it fair, for instance, to twit

them with accepting the patronage of De Retz, who was at the same time held in universal honour among the clergy notwithstanding his pretty notorious irregularities, and of whom his old tutor, Vincent of Paul, a strenuous opponent of Jansenism, spoke as "not far from the Kingdom of God." And it must be remembered that their chief enemies, the Jesuits, never shrank from availing themselves of the most morally questionable alliances; indeed throughout Louis XIV.'s reign they ruled the French Church through the King's mistresses. It is worth bearing in mind, too, when so much is said about the shuffling tactics of the Jansenists, that the Jesuits were always quite as ready to play off the King against the Pope as the Pope against the King for the purpose of crushing them. Nay, more; they took a decidedly Gallican line through the reign of the *Grand Monarque*, as is here incidentally admitted, and even had a hand in drawing up the Declaration of Gallican Liberties, and in 1762 they offered to teach the Four Propositions if allowed to remain in France. One Jesuit writer went so far as to advocate the appointment of a French patriarch without the sanction of Rome. Throughout the whole struggle, while the Jansenists were not always in the right, the Jesuits were almost invariably in the wrong, and their persecuting policy only culminated in the dark plots and horrible atrocities sanctioned by the odious Le Tellier, who, as we are here told, "died despised and hated even by his own fraternity," to whose aggrandizement he had sacrificed every consideration of honour and justice. Neither again can we think it quite fair to designate the Jansenists a "factious sect," and to speak of their breaking the Peace of Clement IX., because they continued to insist on "the distinction between the *droit* and the *fait*," on which their whole position depended. This question about infallibility in "dogmatic facts" was the very one which the Peace of Clement was supposed to leave open, nor could it be called a "pacification" at all if it did not. We do not make these comments with any intention of discrediting the History generally, but simply in order to suggest what appears to us a necessary caution to the reader. No such complete and comprehensive treatment of the controversy, whether theologically or historically, from its commencement in the Roman Congregations *De Auxiliis* and the publication of the *Augustinus* to its close, exists in our language; nor do M. St.-Beuve's brilliant memoirs of Port Royal, which have all the charm of a romance, profess to satisfy the wants of either the historical inquirer or the divine, both of whom must confess their obligations to the present writer. The general moral superiority of the Jansenists to their assailants, which was the real secret of their prolonged and extensive influence, comes out the more conspicuously from the questionable character of their peculiar tenets, and their occasional shiftiness in defending them.

One other point, only incidentally connected with the controversy, is so important in itself that a word may be said upon it here. It is curious to find how a "royal supremacy," in fact if not in name, differing little from that claimed by our Tudors and Stuarts, is again and again brought into play. It was more by the action of the Crown than of the Pope that the obnoxious party, who were looked on as dangerously independent by statesmen like Richelieu and sovereigns like Louis XIV., were put down, and more than once the Pope's hand was forced by the King of France. Thus the meetings of the Assembly of the Clergy, the duration of their sessions, and the nomination of a president rested with the Crown; sometimes an extraordinary assembly of bishops selected by the Crown was held instead; it was to the King that the nine protesting prelates addressed their difficulties and scruples about the Bull *Unigenitus*. Clement XI. himself complained to the French envoy that the Bull had been extorted from him against his will by the letters of the King and Le Tellier, his Jesuit confessor. When the Pope declined to sanction a national Council, Louis resolved to summon one by his own authority, and to exclude the protesting bishops from it by virtue of his prerogative; and when a later Pope, on refusing bulls of institution to twelve bishops nominated by the Regent, was informed that his intervention would be dispensed with, "the bulls were despatched with such precipitate haste that the courier who brought them expired from fatigue on reaching Paris." These are but a few examples gathered almost at random from Mr. Jervis's pages. There are many other points of great interest on which we should have liked to dwell if our space admitted it. And we had purposed to notice the excellent chapter on the Quietists, which, by the by, might have been rendered more complete by reference to the two principal schools of mysticism at an earlier date, in Germany in the fourteenth century and in Spain in the sixteenth, both of which help to illustrate the system of Fénelon and Madame Guyon, the latter chiefly by its contrasts. But it is time to bring these remarks to a close, and in doing so it is only due to the author to say that he has supplied a real and important desideratum in English literature, and supplied it in a way which deserves grateful acknowledgment.

THE FOUNDERS OF THE CANTERBURY SETTLEMENT.*

A MODERATE-SIZED volume published by subscription at the other end of the world, and stitched by reason of the insufficiency of the proceeds to pay for the binding, comes to remind us of one of the most animated chapters of our modern annals—of the days when the Colonial Office, now so blest in the enjoyment of *otium cum dignitate*, was the worst beset and best abused department of the State, stirring up bad blood and hot water in every corner of the empire, and attracting every assailant intent on smiting the Government of the day in a vulnerable place. Indications are not wanting that colonial affairs may again form a subject of eager public interest; for the present the discussion of them seems to be resigned to a crotchety class of theorists, infinitely inferior to the Wakefields, Bullers, and Molesworths of the past generation. No subject would better repay the investigation of the highest intellects; and we can suggest nothing more adapted to fascinate the attention and fire the enthusiasm of kindred spirits than this modest collection of a portion of the correspondence of the late E. G. Wakefield—a collection thrilling from one end to the other with human interest as the embodiment of the strongest emotions of one of the most ardent, vigorous, and versatile of minds. It also possesses especial importance from its relation to the history of the Church of England colony of Canterbury, New Zealand, the last and most perfect development of that great battle-ground of colonial legislators and economists, the Wakefield system. Were we to endeavour to sum up the principle of this famous project in a sentence, we should term it a substitution of the ancient system of colonization for the modern no-system—"the ordinary scramble of what is termed colonization," as Mr. Wakefield here disdainfully styles it. Mr. Wakefield, who, though educated at Westminster, ingenuously confesses his shyness of Latin and awe of Greek, had probably little knowledge of the methods of the Greeks and Romans; but his powerful and sagacious intelligence, concentrated upon the problem during a period of enforced seclusion, guided him to principles practically identical with theirs. He wished to methodize and regulate colonization—to make it, as the ancients made it, an affair of administration; and for this purpose he devised the scheme of the sale of land at "a sufficient price," which detail of the plan, affecting pockets rather than principles, has been taken for the essence of it, instead of being regarded as a mere means to an end. The real object was to make the colonies miniature Englands, transplanting all classes of society in their due proportion by the exercise of systematic selection, instead of trusting to the operation of the natural causes which practically transplant only one. A colony founded on the Wakefield system would accordingly be aristocratic in its constitution in proportion as the governing principle of the system had been observed. Like all productions of the speculative intellect, the theory proved in many respects too refined for practical working. Australian gold discoveries and their consequences would have swept away the most ingenious restrictions on freedom of occupation. But if the Wakefield system has not moulded the conditions of colonial society, it has tempered and refined them in proportion as it has been applied. The closer approximation of South Australia and New Zealand to the English model can only be explained by the principle of selection which regulated the original immigration, and the more orderly political system which has been among its results.

The leading idea of the Canterbury Settlement, as it presented itself to Mr. Wakefield's mind, was no doubt the enlistment of the Church of England interest in the furtherance of his plans of colonization, as a counterpoise to the Exeter Hall influence by which they had been so pertinaciously opposed. His coadjutor, the late lamented John Robert Godley, probably approached the subject from a different side, and to the breadth of view arising from this harmonious contrast of character and aim the success of the undertaking is mainly to be ascribed. Mr. Wakefield, in a memoir setting forth the claims of his colleague, generously assigns to him the sole credit of the conception; it had in fact, however, been already put in operation at the founding of the Free Church colony of Otago, and the germ of it may probably be detected in a note to Wakefield's *England and America*, published in 1833 (vol. ii. p. 255). Whatever may be the abstract propriety of colonization on Denominational principles, the scheme fell in admirably with the Wakefield system, insuring the zealous support of influential persons, and a high standard of respectability in the majority of the colonists despatched under their auspices. The plan was elaborated between Mr. Wakefield and Mr. Godley in the autumn of 1847, at Malvern, where the former was recruiting his health after a severe illness. Upon his partial convalescence he had had the mortification of finding himself a cipher in the counsels of the New Zealand Company, founded and long controlled by him. To him colonization was an art, his system was dear to him as the child of his brain, and it may be surmised without much breach of charity that the pecuniary interests of the shareholders weighed little with him in comparison. The other directors, taking a more strictly commercial view of their obligations, were ready for any concession to a hostile Government that might afford a chance of rectifying their unequal balance-sheet. When, therefore, it became apparent that the Canterbury project, whose Church character rendered it generally unpalatable to the Whigs, stood no chance of being taken up by the Company, the centre of gravity was shifted from Mr. Wakefield's circle to Mr. Godley's, and an entirely new band of colonial reformers, for the most part actuated by strong ecclesiastical predilections, appeared upon the scene. Prominent among these were Lord Lyttelton and the late Sir John Simeon. Mr. Wakefield himself, resigning his directorship in the New Zealand Company on a transparent pretext,

---

* *The Founders of Canterbury: being Letters from the late Edward Gibbon Wakefield to the late John Robert Godley, and other well-known Helpers in the Foundation of Canterbury in New Zealand.* Vol. I. Christchurch (N. Z.): Stevens & Co. London: Trübner & Co

became the principal organizer of the Canterbury Association in England, while Mr. Godley, going to New Zealand as superintendent of the new settlement, earned in that capacity such respect, gratitude, and affection as rarely falls to the lot of a leader of men. His friend, a man of great inequality of character, as Lord Lyttelton delicately expresses it, was not likely to conciliate an equal unanimity of suffrages, and in truth this correspondence is to a large extent the record of the writer's doubts, distrusts, dislikes, jealousies, and animosities. This it is that imparts to them their intensely human and vital character. We are conscious of listening to a man passionately concerned in the effect of what he is saying, and the energy of whose expression corresponds to the energy of his emotion. It is also mere justice to state that, to whatever extent prospects of advantage to himself or his relatives may have formed an element in Mr. Wakefield's support of the Canterbury colony, the primary motive is manifestly zeal for the interest of the colony itself. It is dear to him as the incarnation of his principle. The New Zealand directors are, in his eyes, apostates from the orthodox faith in colonial matters, and dire is his wrath, and relentless the holy war he wages against them. As, however, a man's worst foes are those of his own household, his sufferings on this head are light compared with those which he is called upon to undergo from what he deems the treachery or imbecility of his own associates. The Canterbury Settlement is in perpetual peril of an untimely end, and it is as much as Mr. Wakefield can do to save it by taking the fools and rascals into his most sacred confidence all round. These mysterious revelations of A.'s bungling to B., and of B.'s malpractices to A., are inexpressibly amusing to us, who find ourselves in the position of C., who was favoured with them both, minus C.'s own danger from D. in the background. But the writer's loyalty to Godley never falters; he speaks of him invariably with an affectionate chivalry of sentiment honourable to both. Of Lord Lyttelton, too, and Mr. Sewell, he always expresses the highest opinion. The most important letters are those addressed to Mr. Godley in New Zealand, both as being the longest and most unreserved, and as entering into details more fully than would have been needful in the case of a correspondent at home. Other letters, illustrative of the inner working of the Association, are most interesting, and afford valuable hints for all concerned in co-operation for public objects. Next to these we should place the letters addressed to Sir William Molesworth, Mr. Adderley, and other persons of Parliamentary influence, with the view of disposing them favourably towards the Association. These are in general distinguished by diplomatic tact, and are frequently models of the writer's great art of studied frankness. Casual remarks of the utmost sagacity are strewn up and down; in one place (p. 67) the history of English political party for the next four years is foreshadowed in half-a-dozen pregnant lines; one letter, addressed to an emigrant on the subject of marriage, is especially admirable. Lastly, there are frequent glimpses of genuine human feeling, cordial, tender, and profound. The style—impetuous, guarded, and playful by turns—has all the distinctive merits of that style whose main merit is manliness.

To constitute the founding of Canterbury a perfect epitome of human affairs an infusion of the comic element was essential, and it was abundantly supplied by the episcopal department of the business. A Church colony implies a bishop, and Mr. Wakefield soon found the necessity of directing his versatile intellect to the consideration of this novel subject. Indeed he would appear to have made a sort of experiment in episcopal functions himself on the *corpus vile* of "my nephew Torlesse, *whom I have drilled at clerical work*." It was easier to drill young Torlesse than to find a bishop acceptable to one half of the Church who should not be obnoxious to the other; and the great colony-maker, wise as a serpent in the affairs of this world, seems to have proved himself innocent as a dove in spiritual matters. He perceived, indeed, "the evil tendency of a decided party colour," but was colour-blind as regarded the perception of the colour itself. "Surely the Church comprises many earnest Churchmen who are not members of the Puseyite or Tractarian party. I would name, for example, Gladstone and the Bishop of Oxford." The idea of conciliating Evangelicals by putting Mr. Gladstone and Dr. Wilberforce on the Committee does not argue much nicety of discrimination in ecclesiastical concerns, and we are not surprised to find Mr. Wakefield soon afterwards acknowledging, with a diffidence very unusual with him, "I do not understand this part of the subject well myself." The truth of this confession is more than sufficiently illustrated by the amusing details of his successive experiments in bishop-making.

It will be seen that this volume abounds with piquant personal matter, and perhaps some persons will congratulate themselves upon its having hardly been as yet published in any proper sense of the term. Mr. E. J. Wakefield, the editor, is evidently superior to the weakness of considerateness for other people's feelings. No book could stand more in need of editorial illustration, many of the allusions being unintelligible except to the persons immediately concerned. Under the circumstances, however, penury of comment may be excused, for Mr. E. J. Wakefield's *ex parte* annotations could have carried no authority. The work itself is, of course, entirely *ex parte*, and each letter must be perused with caution, as the exposition of a most skilful advocate with a strong personal interest in the effect of every sentence he writes, and unsurpassed in the art of representing things as he wishes them to appear. With all these allowances, it is a book such as Australasia has not hitherto given to the world. The value of Mr. Wakefield's papers can hardly be overestimated, whether they are regarded as contributions to history, to political economy, or to the science of practical administration, as galleries of vivid portraits, or as repertories of terse and sagacious maxims. Deeper still is the autobiographical interest arising from their connexion with the extraordinary man from whom they proceed, the statesman who never held office, and whose career is a chapter of romance. We have referred sufficiently to the drawbacks to the public usefulness of Edward Gibbon Wakefield to make it plain that we are not unaware of them, and do not lightly esteem them. But the time has arrived when these things may well be forgotten in consideration of the splendid services of (we quote Lord Lyttelton) "the man beyond comparison of the greatest genius and widest influence whom we have had in the great science of colonization, whose name is like a spell to all interested in the subject."

DUNCAN'S HISTORY OF THE ROYAL ARTILLERY.*

THIS book shows the mischievous influence of the taste for what is called fine writing. The author has exclusive possession of a vast store of interesting information, and yet he cannot be content to tell his story without trivial and futile attempts at literary embellishment. In the volume which he has yet to publish of this History he will do well to apply the old rule which teaches that, when you have written anything that you like particularly well, you should strike it out. We shall endeavour to profit by the facts contained in the first volume, while as far as possible disregarding its style.

Ordinary historians expend eloquence on the victories, and pass almost in silence over the defeats, of their countrymen, and whether they speak or hold their tongues they almost equally obscure the true character of military operations. The historian of the Royal Artillery is able to narrate with equal truth and satisfaction the services of his corps alike at Yorktown and Gibraltar, at Fontenoy and Minden: for, whatever the result, they did their duty well. We are now so easily frightened from our propriety that we hardly realize the dangers amid which our ancestors lived perhaps as happily as we live now. The year 1779 saw England engaged in war on both sides of the Atlantic. Her struggle with the revolted colonies offered a tempting opportunity to France to avenge her losses during the Seven Years' War, and to Spain to wipe out the disgrace which she felt in the possession of Gibraltar by the English. The Royal Artillery in this year consisted of thirty-two service companies, of which number sixteen were in America, five in Gibraltar, and seven at other stations abroad. Nor was this foreign service weary and uneventful as it sometimes is now. At that time England was fighting almost for existence, and every company had to share the danger. The garrison of Gibraltar consisted of six or seven thousand men, of whom nearly five hundred were artillery. The blockade commenced in July 1779, but it was April 1781 before the bombardment from the Spanish lines can be said to have regularly begun. It continued without twenty-four hours' intermission for thirteen months. The grand attack was made in September 1782, and the firing ceased altogether in February 1783. The blockade was varied by occasional reliefs, and thus two regiments of the line, which were not part of the original garrison, shared the honour of the defence. It is interesting to observe that, when the attack was made, the battering ships "with their supposed impregnable shields" were the mainstay of the enemy's hopes. But the use of red-hot shot by the garrison destroyed almost all their ships. When the grand attack did commence the artillery of the garrison had attained by length of practice admirable proficiency in resisting it. The privations of the siege were severe. At one time scurvy had so reduced the effective strength of the garrison that a shipload of lemons which had arrived was a more valuable contingent than several regiments would have been. A cow was purchased by a Jew for sixty guineas, but in so feeble a state that she dropped down dead before she had been removed many hundred yards. The haggard crowd which witnessed this occurrence had still vitality left in them to laugh at it. The usual stories are told of the discovery of provisions hoarded to await the highest possible price. The peace of 1783 was painful to England, both in a military and political point of view. The salvation of Gibraltar and the loss of our American colonies were celebrated at the same moment. A strong arm saved the one, a foolish statesmanship lost the other. "But," says the author, with more force than he usually shows in his original remarks, "be statesmen wise or foolish, armies have to march where they order, and the history of a foolish war has to be written as well as that of a wise one." It is not the least of the merits of the British soldier that he obeys—not without murmuring, for he always murmurs—but he obeys implicitly the orders even of the most incapable of War Ministers. The companies of Artillery which served at Gibraltar have a reputation to maintain which no altered nomenclature can justify them in allowing to become tarnished. "Their story should be handed down among the officers and men belonging to them." There is no fear of courage being wanting; but the standard from which

* *History of the Royal Regiment of Artillery.* Compiled from the Original Records, by Captain Francis Duncan, M.A., D.C.L., Royal Artillery, Superintendent of the Royal Artillery Regimental Records; Fellow of the Geological Society of London, and the Royal Geographical Society. Vol. I. To the Peace of 1783. London: John Murray. 1872

there should be no falling away is that of the old proficiency maintained under such adverse circumstances, and of the old conduct which displayed itself in cheerful submission to the greatest hardships.

Another equally gallant but unavailing service was rendered by the Artillery in the defence of St. Philip's Castle, in Minorca. Here, also, scurvy was the most formidable enemy of the garrison. An officer and six men daily were told off to gather potherbs on the glacis. The siege lasted from August 19, 1781, to February 5, 1782. When the capitulation was resolved upon there were only six hundred men able to carry arms, and they were entrenched in a mere heap of rubbish.

The American War was at once unpopular and unsuccessful. When it was over the nation seemed to be inspired by a longing to forget it. It was associated in their minds with everything that was unpleasant, and hence the many gallant services performed in it have hardly been appreciated as they deserved. Yet Washington urged his own artillery to emulate that of his enemy. The silence of historians on one side is not compensated by loquacity and grandiloquence on the other. The student is baffled by the one and bewildered by the other. The siege of Quebec by the Americans was unsuccessful, and little more was done by them in Canada. The loyalty of this country, says the author, is one of the marvels of English history. "It seems undeniable, as it certainly is unselfish." The American War began in 1775, and a little more energy in the British commanders might have finished it next year. Some of the New York militia refused to do duty. They were offered, they said, peace, liberty, and safety, and what more could they ask? "It is healthy reading," says our author, "in the midst of flabby orations as to the uprising of a united people, to examine passages like that just quoted." We begin to think that we have been unjust, and that this is not so bad a writer as we had supposed. But he really is very exasperating sometimes. In 1777 the expedition of Burgoyne from Canada, in which all the army and particularly the Artillery did their duty well, ended in surrender. This was the signal in Europe for action among England's enemies. In the previous winter the officer commanding the Artillery in New York demanded from the Home Government a supply of greatcoats. This appeal was made in 1777, and was granted in 1780. New York was occupied by the British army in 1776, and was held until the termination of the war. For many reasons it was more loyal than any other part of the revolted colonies. In 1777 General Pattison of the Artillery was appointed Governor of New York. The newspapers of the time, which have been consulted by the author, give a curious picture of the business, amusements, and daily routine of the city during the British occupation. The Garrison Dramatic Club, whose profits went to assist the soldiers' wives, was composed of officers of the garrison, assisted in their performance by young ladies, daughters of New York merchants, whose parts were played, according to the critics of the time, "with great propriety, spirit, and accuracy." One of the chief actors in the club was Major Williams of the Artillery, who was also Brigade-Major of the garrison. In the Library of the Historical Society in New York there is yet to be found frequent and favourable mention of this officer's rendering of Macbeth and Richard III. There was a newspaper in the city which uttered such loyal sentiments that the publisher, who was also a bookbinder, was permitted to send books to the Jerseys and elsewhere for sale. In the binding of the books were concealed despatches for Washington, who was thus supplied with the latest news from New York and England. The price of tea was 18s. per lb. The price of corn varied with the punctuality of convoys from Ireland. Claret was cheap and plentiful. General Pattison lived at No. 1 Broadway, on the Bowling Green. At his door stood a sentry in the uniform of the Artillery, with gold-laced, cocked-hat, and black feather, hair clubbed and powdered, white stock, white breeches, and white stockings, and armed with carbine and bayonet. General Pattison was very courteous in manners and correspondence, and particularly careful of the welfare of his subalterns. One of these young men, being detached in Florida, had got married, and, having nothing to keep a wife upon, wrote to the General to propose that he should be appointed quarter-master, in order to supply him with an income. The General, in answer, mildly explains that the good of the service does not appear to him to require that every detached company should have a staff annexed to it. In another letter of the same date he acknowledges the arrival of a draft of recruits at New York, four having deserted, and one died on the passage. "I should not," he says, "have been very much afflicted if many of those who landed here had saved me, either by death or desertion, the pain of looking at them." He conjectures that the reason why so few stands of arms accompanied the draft was that these "whippers-in and postilions" were thought to be unable to bear them. He wishes his recruits were lost in the bogs from which they sprang. Another and less lively letter was addressed to the Board of Ordnance, who were very wooden-headed, obstinate, and addicted to circumlocution. Their officials delighted to snub and carp and disallow. The great lesson of patience under official arrogance cannot be better studied than in the letters of General Pattison to the Board of Ordnance.

The command of General Pattison over his own corps was co-extensive with the American continent; and he had a troublesome subordinate in Virginia who habitually demanded stores in the wildest manner. "The first thing he always did on arriving at a new station was to send in requisitions as if he were going to fortify Gibraltar." The winter of 1779 was one of the hardest ever recorded in New York. The water was frozen between New York and Staten Island, and guns were carried over on sleighs. It was an anxious time. The insular advantages of New York disappeared on the formation of this unexpected high road of ice. The Jerseys were swarming with Washington's troops, and as nearly the whole of the regular force had gone from New York to Charleston on special service, the General dreaded an attack which he might be unable to resist. Notwithstanding the croaking of many advisers, he called out and resolved to arm the inhabitants to test the sincerity of their professions of loyalty, and to ascertain whether his rule in the city had been successful. To those who assured him that it was a rash measure, he answered that he felt confident that the number of doubtful characters was trifling, and as these few would be blended in the ranks with the many who could be relied on, they would be less capable of doing mischief under arms than if left to hide in their dwellings. The event proved that he was right, and it is an honour to the Artillery to count an officer of such sagacity among its members. While conscientiously and laboriously fulfilling his duties, he acutely observed the faults of the Government which he served, and the difficulties of the task in which he was engaged. It is a pity that our author should append to his interesting account of this able officer a page and half of description of his death in Dill Street, Berkeley Square, "on a wild March morning," which is a bad copy of that bad model, the Special Correspondent of a modern newspaper. We are reminded of a story of a Cambridge tutor who advised an aspirant to classical honours not to read the New Testament in the original, "as it might creep into his Greek prose." We can hardly advise this author not to read the public journals, although his second volume is almost certain to be vitiated by their style.

UNA.*

WE know that we are all full of faults; worms for the one part, and miserable sinners for the other. But some of us do contrive to keep a little intellect and common sense in the midst of our wrongdoings, and most of us endeavour to hold one chamber of our soul, if not more than one, swept and garnished, and untenanted by undesirable visitors. Also some of us have the capacity to learn. We may be slow to receive benefit from our stripes, and experience may find us but dull scholars; still we generally manage to get a few lessons by heart, and to avoid this year the patent mistakes we had made and suffered for last year. The authoress of *Una*, however, thinks differently of the world. In her gallery of illustration men and women are but a shade removed from moral idiocy, and prove themselves incapable of learning, however strenuously they may be taught, and however bitterly they may suffer for previous failures. They all pursue for a second, third, and fourth time exactly the same path as that by which they had come to grief before; and none of them can be taught the difference between feeling and seeming. So long as they honestly feel rage, jealousy, revenge, whatever the dominant passion of the moment may be, they neither ask themselves if they have cause nor reflect on the effect which their show of temper will produce. Though they find that their displeasure is met by surprise and ignorance of the cause, they do not doubt their justification or question their own wisdom. All they think of is the reality of their feelings, not the reality of the grounds thereof. "I felt, therefore I showed; I was angry, therefore I wept or I stormed." It is easy to see that life conducted on such a plan as this means a life of turmoil and dissatisfaction to all concerned; and that what folly sows sorrow will reap, and garner a pretty large harvest into the bargain.

Una is one of these absurd people, who feel without justification, and express what they feel without foreseeing the results. If she takes an unreasonable fit of jealousy into her foolish head, if she allows herself to be hurt and huffed without cause, if she chooses to resent as insolent interference every well-meant word of advice she receives from her elders, she shows her temper without restraint; and then pities herself passionately as a martyr when the inevitable consequences ensue. We have rarely met with a less interesting character than hers; and we scarcely know whether Miss Bowra meant her to be interesting or not. She seems to lay claim to something that might pass for a heart, but that may also be a mere mixture of physical sensitiveness and intense self-consciousness; much that passes by the name of fine feelings, and keen affections easily wounded, being literally nothing more than an uneasy temper combined with egotism. All throughout her history she is shallow and selfish. She loves the Honourable Herbert Elmore because he is tall, has blue eyes, "intermediate-coloured hair"—whatever that may mean—a soft voice, and variable behaviour, by which he has first piqued, then won her; and she marries him for no better reasons. He, on his side, loving another, marries her for her money, for she is "the rich Miss Randolph," and inherits twelve thousand a-year, with other contingencies. Being a gentleman, however, in breeding, if as selfish in his own way as she is in hers, he means to make her a tolerably good, if not very demonstrative, husband. He dislikes scenes, and despises jealousy; also

* *Una; or, the Early Marriage.* A Domestic Tale. By Harriette Bowra, Authoress of "Redlands." London: Hodder & Stoughton.

he has the man's not very unusual abhorrence of public love-making, and he is sensitive on the score of manners. A more reasonable woman than Una, seeing where her own mistake had led her, might have set herself to win the deeper affection of her husband by attention to his not unreasonable requirements; and she would have succeeded in time. But our heroine, all the while protesting her passionate love for Herbert, cannot control her temper on any occasion to do him pleasure; and finally alienates him to the last degree by an action so outrageous as to excuse the harsh measures with which he meets it. No one can have any sympathy for a woman who leaves her child and her home because her husband has invited his cousin to stay a day or so with them; this same cousin being a sweet and lovely character, of whom the wife has allowed herself to become madly jealous without a shadow of reason or excuse. If we could read Miss Bowra's intention more clearly, we should know better what to say. If she means to show the wrongfulness and folly of giving way to temper in the present novel as she did in her former, *Redlands*, she certainly has, in a sense, proved her point; if not the artistic sense; but if she means to claim our sympathy for a warm heart and a good nature unfavourably dealt with by circumstances, she has utterly failed. A wife whose sole idea of conjugal happiness is centred in caresses, and deep looks of love, and moonlight rambles on the terrace, and the tightest possible strain of the apron-strings, and who, failing these manifestations, gives way to tears, to rebukes, to pettish sarcasms, to outrageous retaliation, is of all women the one most likely to make an unhappy home, and to create the estrangement which she begins by deploring. It is a character with which few men have patience, and such a man as Herbert Elmore would naturally have less than many others. The consequence of all which is, that the reader has no sympathy with either wife or husband, and that, while he condemns the mercenary motives of the one, he cannot sympathize with the betrayed affections of the other.

Una mars her life by her unappeasable jealousy of everything in which her husband takes an interest—his mother, his friends, his yacht, his cousin, and, finally, their own child; and as her jealousy is always mean in object and silly in expression, it awaken neither sympathy nor respect. On the other hand, Herbert mars his life by his hardness and want of heart—save when he is dying—and his extravagance. That extravagance, however, is one of the odd things of the story. It is of the underground kind which has nothing to show. He keeps a yacht, and it costs him five hundred a year; but his wife has an income of twelve thousand pounds of her own; and five hundred for a yacht seems scarcely a criminal proportion of expenditure. Una and Una's biographer evidently think it is; and look with horror on an item so excessive for a mere matter of pleasure. We hear of nothing else; though we are told that he is always crippled with debt, both before and after his marriage; and, finally, as the Earl of Granchester, he contrives to become bankrupt in a manner as mysterious as the rest. Yet whether he had lost money on the Turf, through subsidizing an embassy, starting a newspaper, or leasing a theatre, we are not told. Perhaps guinea points at whist with five pounds on the rubber had something to do with his embarrassments. This is quite as likely as that his yacht at five hundred a year should have made so much havoc in his income as to have reduced him, first to debt and then to bankruptcy. To be sure there was the house in Upper Grosvenor Place, and the servants' food and wages. These outlets, however, are stopped when Una runs away; and, as after that Una lives at her sister's, and Herbert passes most of his time on his yacht, we should have imagined he might have saved money rapidly. He was spared the expense of button-hole bouquets and white gloves; also of cabs and club dinners; did not these count for something in the Earl of Granchester's bankruptcy? We fear that Miss Bowra gets a few inches out of her depth when dealing with the aristocracy. It is not given to every one to be able to map out the righteous outgoings from an earl's estate, and a wife's dower of twelve thousand a year; and to set down how much might go in housekeeping and *les menus plaisirs* before touching that fatal door in Basinghall Street; and we are compelled to believe that the authoress of *Una* is not one of those gifted. If she is, she ought, in justice to her hero, to have told us how he ran through his money with such fatal rapidity; and why his lawyers could not get better terms for him than bankruptcy because a storm had unroofed a few cottages and blown down a lot of trees in the park. Could not the fallen timber have been sold at so much per foot to have met those heavy "unlooked-for expenses" of re-roofing the cottages, and to have backed up the "rigid economy" which is to be the order of the day at Granchester, the first item of which is "no longer lavender kid gloves *ad libitum* for careless people to sow by the wayside"? If Miss Bowra will allow us, we will give her a word of counsel to leave the nobility and the plutocracy alone in her next book, and to write of social circumstances only as she understands them.

There are certain things in *Una* which are not so much mysterious as truncated—things which are not even faintly shadowed, but are left wholly unfinished. What, for instance, is the secret sorrow that makes Julie Kenyon's life a burden to herself, and, we should imagine, a nuisance to her friends? What had she done to Mr. Randolph or to Mrs. Randolph in the past? Had she been in love with him, and for love of him had she poisoned his wife? Nothing less serious can explain away the very madness of remorse that oppresses her. She is certainly what our friends in the North would call a gruesome woman, with her dark eye that never flashed, her mouth that rarely smiled, and, when it did, that had "no hilarity in the smile," with her silver white hair and marble stillness of demeanour, coupled with her fierce pietism. Devoured by something, we can give no better guess at what that something is than the secret poisoning of Una's mother for love of Una's father; and her conduct about the legacy seems to bear out our explanation. When Una goes to see her, to tell her that she is engaged to Herbert and ask her congratulations, she finds her in a terrible state, following on an interview with Mr. Randolph. Her head is "buried in the cushions of the sofa on which she sat, and sobs, loud and deep, shook her frame." After she has flown out at the girl for being "a spy on her privacy," and candidly exclaimed, "Henceforth I shall hate you!" she gives as her fierce commentary on the engagement this remarkable outburst:—

> "Una, Una," she said, laying a heavy hand upon my wrist, and tightening her clasp as sentence succeeded sentence; "beware of the beginning of evil—beware how you admit the first thought of anger, passion, pride, or jealousy to your bosom. If you suspect its existence, search for it—pluck it out, cast it down, tread upon it; were it small as the mote that dances in the sunbeam, insignificant as the tiniest grain of sand—crush it at once and for ever, lest it grow beyond your control. If voluntarily indulged, you will be left to yourself, and the fatal evil will wither your life with its deadly upas blast!"

It is cruel of Miss Bowra thus to play the Sphinx and to provide no Œdipus.

The book is dull, the plot drags, and the method of narration is forced and heavy. Miss Bowra does not carry her reader along with her, and her heroine does not interest. The autobiographical form, so easy for short sketches, is the most difficult kind of writing for a larger work. It requires the power of distinct impersonation with careful analysis; but the one must be delicate and suggestive, the other tender and not self-conscious. In any case *Una* has not hit the mark; and, whether as a work of art or as a story with a purpose, it is weary reading and hazy painting.

FRENCH LITERATURE.

READERS who like accuracy and painstaking ought to enjoy M. Jal's works. They are of a special character no doubt, and nautical matters address themselves to a comparatively small class of students; but it is seldom that we find books prepared with more thoroughness, and we may be sure that any subject on which M. Jal undertakes to concentrate his attention will be examined by him from every point of view. It is more than forty years ago since the author of the volumes before us * was appointed by Admiral de Rigny, then Minister of Marine, to form part of the Royal Commission organized for the publication of documents relating to the history of France. He then drew out for himself a plan of work which included—1. A history of naval architecture from the earliest time to our own day; 2. a nautical glossary; and, 3. a biography of the principal French sailors. In course of time the first two instalments of the scheme were satisfactorily disposed of, and the life of Abraham du Quesne is a contribution to the third. M. Jal soon found that a complete gallery of the notabilities of the French navy would be beyond his strength, if the work was to be treated with anything like detail; he therefore limited his researches to the reign of Louis XIV., and now gives us the earliest result of his investigations in that quarter. The two volumes before us must not be considered exactly as a literary production, although they are far from being ill written; they are a simple statement of facts supported by an immense number of *pièces justificatives*, and illustrated with portraits and facsimiles. The life of Du Quesne must necessarily be a history of the French navy, for the growth of that branch of the service corresponded to his own physical and intellectual progress. M. Jal's work accordingly is more important than a simple biography; it places before us a complete description of Colbert's political management so far as the navy was concerned, and it introduces us to some of the most distinguished characters of the seventeenth century.

M. Glais-Bizoin † comes rather late to give his view of the revolution which for the space of five months placed him and his friends at the head of affairs in France. He wished first of all to read the various works published on all sides with reference to that event, and he saw, as he tells us, that both Republicans and Royalists were equally determined to misstate facts, and to find fault with the little band of patriots who had risen to political influence by the force of circumstances. The ultra-Republicans, anxious to continue the traditions of 1793, wanted to terrorize the country, and called for a Danton; the Royalists, on the other hand, accused M. Glais-Bizoin and his colleagues of having obeyed the dictates of a vulgar ambition, and of assuming an authority which they had neither the ability nor the right to wield. Thoroughly persuaded that the Republic is now the only possible form of government in France, but that even in a democracy there ought to be no room allowed for rogues and fools, M. Glais-Bizoin estimates with much impartiality the various personages whom he had occasion to meet during his tenure of office, and he tells some amusing anecdotes about certain great men belonging to the Commune.

The suppression of the monopoly which the University of

* *Abraham du Quesne et la marine de son temps.* Par A. Jal. Paris: Plon.

† *Dictature de cinq mois.* Par A. Glais-Bizoin. Paris: Dentu.

France enjoyed until lately, and by virtue of which no independent teaching of any kind was allowed, has proved in the highest degree beneficial to the cause of education. Schools, colleges, and associations for the delivery of lectures on various subjects of literature and science, have been everywhere opened, and the University, now obliged to compete with men of untiring energy and great ability, is already feeling the beneficial effects of this rivalry. The foundation of the *Ecoles libres des sciences politiques* is amongst the latest results of this movement, and the pamphlet which we have now to notice may be considered as an excellent specimen of the kind of teaching given by the members of that association. M. Albert Sorel takes for the subject of his addresses* the treaties of 1815, and his three lectures on that important epoch in modern history are very interesting. The events of the Hundred Days, the plans for the dismemberment of France, and the formation of the Holy Alliance, are treated successively, forming, so to say, three monographs in which the facts are briefly stated and their consequences explained. M. Sorel has made ample use of the many works written on the last campaigns of Napoleon, and on the revival of constitutional government in France; he quotes repeatedly from them, and thus corroborates his narrative by the authority of such men as M. Duvergier de Hauranne, M. de Vielcastel, &c.

The second volume of M. Guizot's new History of France† has just been published; it takes the reader down to the end of the reign of Louis XII., and is certainly one of the most valuable books of the present season. The author's merits as an historian have hitherto been considered to lie chiefly, if not exclusively, in his talent for generalization, in his philosophical views, and in his masterly exposition of abstract principles. The *Histoire de la civilisation en France* did not show that descriptive power which must ever be the secret of M. Augustin Thierry's fame, and even the *Mémoires pour servir à l'histoire de mon temps* seemed to many readers somewhat heavy, too little room having been allowed for the picturesque element. The work now before us, however, places M. Guizot in an entirely new light; whilst he still shows those powers of reasoning and generalization which made his early reputation, he has superadded a graphic vigour of which few thought him capable; he remembers that he writes for the young, and in this second volume especially he has managed to throw great dramatic vigour into his narrative. It is true that the events he had to relate are of a sufficiently exciting character almost to compel the historian to be interesting; the reigns of Charles V. and Charles VI., the Hundred Years' War between the English and the French, Charles VII. and *La Pucelle*, Louis XI. and Charles the Bold—such are the leading actors in the book. M. de Neufville's woodcuts are very good, and in the case of portraits they have been copied from authentic originals.

During the last twenty or thirty years pictorial embellishment has played a considerable part in scientific works. It is impossible to popularize science without the help of engravings, and therefore astronomy, natural history, and chemistry court the aid of artistic talent. One of the most successful attempts we have lately seen in this direction is M. Poiré's work, *La France industrielle*.‡ Composed with much care, being neither overburdened with technical details, nor, on the other hand, too discursive and elementary, this volume supplies a long existing desideratum. It is certain that, even on this side of the Channel, many people who are generally considered well informed know very little about manufactures and industrial products; they would be rather puzzled if they were asked how needles are made, or by what process the glass out of which they drink is coloured and adorned with elegant patterns. M. Paul Poiré has endeavoured to clear away this ignorance by giving details as to the various branches of industry which can be understood easily without the necessity of special training. In order to do this profitably, great lucidity of exposition was required, together with the assistance of numerous woodcuts; the former our author possesses in a remarkable degree, and the latter has not been grudged by the publishers.

Dr. F. Hofer has enriched Messrs. Hachette's collection of works on universal history with an interesting summary of the progress made by botany, mineralogy, and geology from the earliest time to our own day.§ Not only does he give biographical details respecting the chief scientific observers, but he explains their systems, and shows how far these systems are borne out or contradicted by the results of later investigations.

Microscopic observation is indispensable for botanists; some of the organs of plants cannot indeed be studied otherwise, and in all cases the facts revealed by that delicate instrument are worth attentive consideration. M. Girard has therefore done good service in devoting a separate volume of Messrs. Hachette's *Bibliothèque des merveilles*‖ to this subject. After a few preliminary remarks, he describes in the first part of his work the different organs of plants, their structure and their use. He then takes up separately those forms of vegetable life which absolutely require the use of the microscope if they are to be examined accurately, such as the fungi, yeast, oïdium, lichens, mosses, &c.; and he ends by an interesting chapter on the microphytes and the microzoa which constitute so large an element in what we call dust. Upwards of two hundred woodcuts taken from photographs illustrate the volume.

If Jean-Jacques Rousseau were still alive, and still an enthusiastic admirer of the virtues of uncivilized man, we would ask him to glance for a moment at M. de Lanoye's *L'homme sauvage*.* What a commentary on the Golden Age and on primitive innocence! We must acknowledge, however, that in describing the condition of man, first as a hunter and then as a tiller of the ground, the learned historian has drawn a very interesting picture, and his account of the migrations of the Semitic races, the Celts, the Scythians, and the Chinese deserves to be attentively studied. It is a subject for regret that *L'homme sauvage* should be a posthumous work; M. de Lanoye had purposed to write a history of civilization, grouping his description of each form of progress around some distinct personage intended to embody it. Thus his book entitled *Rhamsis le grand* was devoted to Egyptian culture, and the whole work, when completed, would have formed a series of monographs. The present volume, published by the writer's son, and illustrated with numerous engravings, is a fragment originally intended to appear in M. de Lanoye's *Opus Magnum*.

The architectural revolution introduced by Napoleon III. in Paris caused the disappearance of many public and private buildings which were historically, if not artistically, curious; the vandalism of the Commune carried the work of destruction still further, and it is not the fault of Messrs. Vermersch and Grousset if the Sainte Chapelle is still in existence. By way of preserving at least a record of what Paris was, the Imperial Government had begun the publication of a sumptuous work, several volumes of which have been issued. M. Charles Demaze now wishes to add his share to the undertaking†, and he gives us a concise account of the Sainte Chapelle. The building certainly deserved a careful record, for its architectural importance has often been acknowledged by competent judges, and its history is closely connected with that of the Paris magistracy. M. Demaze not only describes the foundation of the church and its various vicissitudes, but he gives us lists of the dignitaries belonging to its clergy, transcripts of charters, catalogues of documents, &c. &c.

M. Lemerre's elegant series of French classics now contains the second volume of Molière's plays‡ and the first of Montaigne's works.§ If a new edition of the great comic dramatist was necessary, certainly the same may be said of the Gascon *gentilhomme's* Essays. M. Burgaud des Marets informs us that he has corrected more than thirty thousand errors in the best of former reprints; let us hope that M. Courbet and M. Ch. Royer, who are responsible for the present beautifully got-up octavo, have been more careful than their predecessors. There are three sets of various readings an acquaintance with which is required towards determining the text of Montaigne's works; the first is contained in the edition of 1588, published by the author himself four years before his death; the second is furnished by the edition of 1595, which Madlle. de Gournay undertook; the third may be found in a copy of the 1588 text, preserved at Bordeaux, and the margins of which are covered with notes in Montaigne's own handwriting. The recent editors have preferred the second on account of the difficulties which the deciphering of the marginal annotations present in the copy belonging to the Bordeaux Library. They announce in their preface a life of Montaigne, a glossary, and other appendices, which will no doubt form part of the second volume.

M. Victor Cherbuliez reprints together two series of essays‖ which have nothing in common; the former includes biographical sketches of Lessing and of Dr. Strauss; in the latter we find critiques on the Paris *salon*. Many readers will be of opinion that M. Cherbuliez is very one-sided in his endeavours to estimate the German writers we have just named. At any rate it seems to us that the analytical tendency which aims at reducing everything to a kind of intellectual dust so minute that it cannot be weighed scarcely deserves unqualified eulogy.

No French writer has lived more intimately in the company of Goethe than M. Henri Blaze; he knows German literature thoroughly, and more especially the history of the author of *Faust* has no secrets for him. Nearly forty years ago a translation of that wonderful poem, accompanied by a kind of philosophical (and somewhat obscure) preface, introduced the name of M. Blaze to the reading public; then came a gallery of modern German writers, and a volume of poems composed under the inspiration of the German muse. The group of sketches which he now gives us under the heading *Les maîtresses de Goethe*¶

¶ *Les maîtresses de Goethe.* Par Henri Blaze. Paris: Lévy.

is both a contribution to the biography of the Weimar Jupiter and a commentary on his works; for every one knows what a share the petticoat element had in Goethe's life, and no account of Werther, for instance, would be satisfactory which left unnoticed the character of Charlotte Kestner.

If M. Blaze may be accused of Teutonic sympathies, the same complaint certainly cannot be uttered with reference to M. About. The *impressions de voyage* which he has recently published under the title *Alsace* *, after having issued them day by day in a Paris newspaper, are all dictated by a spirit of intense hatred which too often warps the author's judgment. The *avant-propos*, however, is remarkable from the soundness of M. About's views on the causes of the catastrophe which ended in the siege of Paris. He justly observes that universal suffrage can only lead to despotism when the nation to which it is applied has essentially monarchical tendencies and is profoundly ignorant. His reflections on the folly with which the war was first declared, and the shameful incapacity with which it was prosecuted, are unanswerable, nor is he less admirable when he talks of the madness of those who believed that they could either found an Empire by caricaturing 1806 in 1852, or create a Republic by giving in 1871 a parody of 1793.

It is not generally as a scientific writer that Voltaire is known †; he studied astronomy indeed, and carried on a somewhat acrimonious discussion with Buffon about geological problems; but his mind was far too superficial and too prejudiced for the prosecution of researches which require an unbounded love of truth; and it is absurd to attempt, as Voltaire did, to get rid of difficulties by the help of a few jokes. Still there is no doubt that science held a place in Voltaire's studies, especially during his residence in London, and throughout the period of his acquaintance with Madame du Châtelet; it is repeatedly the subject of his correspondence, and forms by no means an inconsiderable portion of his works. We feel indebted, therefore, to M. Saigny for the monograph he has devoted to this side of Voltaire's character. His volume is an excellent contribution to the history of scientific culture in France during the last century, and he has made it still more complete and more interesting by detailing in a second part of his work the labours of the Académie des Sciences at the same epoch.

M. Charles Lévêque has developed, in a new instalment of the *Bibliothèque des merveilles* ‡, an idea so often explained and illustrated that it would seem almost hackneyed if truths could lose their force by constant repetition. It is always interesting to trace the real harmony which underlies the apparent disorder we see around us, and to show how order springs from confusion and good from evil. Harmonies in astronomy, chemistry, and natural history; harmonies in the moral as well as the physical world—such is the theme chosen by M. Lévêque for his consideration.

Messrs. Hachette's *Bibliothèque rose illustrée*, compiled for the use principally of children, has been made to include not only tales and poetry, but works on history, travels, memoirs, abridged translations of the Latin classics, &c. Narratives of travel published first in the *Tour du monde*, or in separate volumes, very often find their way after a while, condensed, popularized, and shorn of scientific terms, into the collection of neat little duodecimos reserved for juvenile libraries. We have now to notice M. Belin de Launay's abridgment of Lieutenant Mage's most valuable travels to Western Africa.§ We reviewed the original work some time ago, and all the praise which we felt bound to give it is applicable to M. de Launay's abstract. The volume is preceded by a biographical sketch of Lieutenant Mage, who perished with all the crew of his frigate, the *Gorgona*, shipwrecked on the 19th of December, 1869, in sight of the harbour of Brest.

The works of fiction which we have to announce are, we are glad to say, less open to objection than is too often the case. M. Auguste de Barthélemy describes in his *Pierre le Peillarot* ‖ the adventures of a pedlar who, whilst hawking his wares throughout the south and west of France, finds himself mixed up with some of the episodes of the first French Revolution, and upholds the principles of order, religion, and true liberty against the *sans-culotte* friends of Marat and Robespierre. M. de Barthélemy's novel is a work of the same class as M. d'Héricault's *Thermidor*, which we noticed some months ago.

Under the title *L'Augusta* ¶ M. Maurice Sand has published a kind of historical novel which takes us back to ancient times. We must fancy ourselves living in the fifth century, when the Roman world was sinking under a mass of corruption too loathsome to be described, and when the barbarian hordes of Attila were driving the Imperial eagles before them on all sides. Valentinian, Honoria, Aetius, Theodoric, and many other personages with whom M. Amédée Thierry has made us familiar fill the stage, and the incidents are crowded together in great variety. M. Sand selects the epistolary form in the composition of his novel; he distorts history a little in representing the Bagaudæ as philosophical rebels, and he makes the character of Honoria a pretext for introducing love scenes which might well be spared; but, notwithstanding these reservations, *L'Augusta* is an interesting book.

Before concluding, we must take a hasty glance at one or two serials. The last *livraison* of M. Littré's great Dictionary has just appeared, and the illustrious "Forty" must now blush at seeing that one man has been able to accomplish what the whole Académie Française thought impossible. It is quite a case of "Pends-toi, brave Crillon; on a vaincu sans toi!" The *Journal des demoiselles*, with its attractive series of patterns, engravings, and fashions, the *Tour du monde*, with its sketches of scenery and of adventures in foreign climes, are still fulfilling their prosperous destinies; and now another journal specially intended for the young, *Le journal de la jeunesse*, stands forth as a new competitor for popularity. All these publications are issued by Messrs. Hachette and Co., who have also deserved the warmest thanks of enlightened *gourmets* by bringing out the *Livre de la pâtisserie* *, that succulent treatise on cakes, tarts, and puddings which would suffice to immortalize M. Gouffé.

No. 898, Vol. 35. January 11, 1873. [Registered for Transmission abroad.] Price 6d.

THE EMPEROR NAPOLEON.

BY the peaceful death of the Third NAPOLEON in exile and on the verge of old age one of the strangest careers known to the memory of man has been brought to a close. Every variety of good and bad fortune has been tasted by the late EMPEROR. Born and brought up as the heir to the First Empire in its height of splendour, he spent his youth and prime in conspiracy, his maturity in reigning, and his closing years in obscurity. And his character had almost as much of inconsistency and inequality as his fortunes. He was the most determined, the most obstinate, and yet the most vacillating and undecided of men. He showed himself now a dreamy enthusiast, now unscrupulous and energetic in action. He believed in himself and in his star as if he had a divine mission, and yet spent many of his years of power in taking minute precautions against minute dangers. He could think and do great things, but he never thought or acted them out. He won greatness by excessive temerity, and lost it by excessive caution. Bitterly as he disappointed many whose causes he adopted only to relinquish them, he probably disappointed no one so bitterly as himself; for he must have been conscious that he was constantly aiming at more than he accomplished, and that the infirmities of his intellect and character were the real secret of his failure. That he should have succeeded so much and so little must have been an enigma to himself as well as to the world. In early life he dared not only to conspire, which is not much, but he dared to be supremely ridiculous; and ridicule is fatal to most men, and to almost every Frenchman. In 1848 he found that five millions and a half of his countrymen had ceased to laugh at him, and saw in him the best guardian of their dearest interests. When the time came for the final struggle he was fully equal to the emergency. He arranged his plot with secrecy and success, and he executed it with a perfect disregard of honour, justice, and mercy. He forced the Crimean war on France for his own political ends, and he invented the Italian war under the impulse, not only of a calculating ambition, but of his own personal and generous sympathy with Italians. But prudence stayed his hand at Villafranca, and he never afterwards showed more than half a heart in any of his undertakings. He threw away the blood and treasure of France in the absurd Mexican expedition, and then meekly succumbed to the arrogance of the United States, and left MAXIMILIAN to die. He threw away the golden opportunity of mastering Germany offered by the invasion of Denmark, and then had to look on powerless while Sadowa was being fought. He who had astonished and overawed Europe, and on whose mysterious phrases men and nations hung for their fate, dwindled down to intrigues and small schemes and barterings for little gains, and came to see himself jockeyed and bullied by BISMARCK. He could less and less, as time went on, make up his mind how to rule at home. Society got first tired of its saviour, then irritated at him, and lastly impertinent to him. He was one day for nothing but the sword and the police, another day he took to crowning the edifice, and offered what he called liberty to his people. He tried Minister after Minister, and none of them would suit him, for none could please a master who never pleased himself. He staked his fortunes on a great final plebiscite to condone and approve of all he had done; he succeeded, and was frightened at the nature of his success. At last he had no resource but a war which he did not wish, and as to the issue of which he had no confidence. He saw his whole administrative system melt down like a palace of ice in the sun of spring; and then came Sedan, captivity, and exile. But defeat and ruin were not his bitterest humiliations. Death would have been sincerely welcomed by him at Sedan; and he was of far too high a type of mind not to bear captivity with fortitude, and exile with simple calmness. The real culmination of his adversity was reached during the three or four weeks before Sedan, when he flitted about like a sad spectre with this or that body of what had once been his troops, with all government passed away from him, with no authority over his generals, and yet possessed of the keenest sense of the irretrievable mistakes he had made, and of the blunders being committed under his eyes. A man who has gone through such a time has known pangs far keener than the pangs of death.

The incidents of the EMPEROR'S life were so striking, and the indications of his character so unmistakable, that it is easy to seize on the general outlines of his career; but it is impossible at present to do justice to him and to his opponents, to balance the bad and good in his life, or to attempt to fix his place in history. There is one test, however, that may fairly be applied to the memory of a man just dead which is of great value. When his death brings all we know of him rapidly and vividly before our minds, is it on the good or on the bad we know of him that we instinctively dwell? There can be no hesitation in saying decisively that it is the good side of the EMPEROR'S life and actions that first occurs to us; and that we have to think and remember in order to balance the good with the bad. His devotedness in friendship, his sublime indifference to defeat, his patient preparation for greatness, seize on us as we think over his early history, before we allow ourselves to smile at the recollections of his silly imitations of his uncle and the absurd eagle of Boulogne. That for twenty years he kept France quiet, gave her a fair share of glory, made her rich, contented, and powerful, and transformed Paris, naturally strikes us as the main thing; while the terrors of the *Coup d'Etat*, the disasters of Mexico, the audacious jobbery of his satellites, and the ruinous exhaustion of the finances of Paris, seem subsidiary and comparatively unimportant. His generous enthusiasm for Italy, and what he did for her, outweigh what he left undone, or what he did to disappoint her; and Magenta and Solferino cover the siege of Rome and his coquetting with the POPE and Mentana. Above all, this exile dying in England appeals strongly to the memories and gratitude of Englishmen. He was probably at one time the only man in France who was in heart the friend of England. He made the English alliance the basis of his policy. He repressed the bitterness against England which at a critical moment threatened to overflow. He treated Englishmen with friendly favour and magnificent hospitality. He abolished passports in favour of Englishmen, and while his own subjects had to wait and be examined as if they were convicts, cockneys proudly stepped by uncontrolled, as if they had been beings of a superior race. He borrowed Free-trade from England, and, against the wishes of his people and their representatives, concluded the Treaty of Commerce, not only as a measure financially beneficial to France, but as a means of binding together the two nations by the ties of kindly intercourse. When acknowledging all this, we can afford to ignore that the English alliance gave him respectability and position in Europe, and was as much dictated by prudence as by anything else. Nor need we care to remember that he or his agents entered into a secret scheme for striking a treacherous blow at English interests by the seizure of Belgium. He was our friend, not a perfect or a faultless friend, but still a friend, hearty and constant; and England has shown its appreciation of his friendship, not only by an admiration and flattery of him while he was successful which sometimes degenerated into obsequiousness, but by an undemonstrative respect to him since he lost his crown, and by sincere regret at his death.

If the interest awakened by the news of the EMPEROR'S death is great in England, what must it be in France? However high party spirit may run there, few persons in France,

and still fewer in Paris, can hear without many mingled feelings of the close of a life in which the life of the country, and still more of the capital, seemed at one time to be centred. Politically, the EMPEROR'S death will probably not have any great immediate effect; and perhaps there may even be a sense of relief at the thought that there is one source of danger extinguished. Whatever virtues or recommendations Imperialism may have had, they are not transmissible by mere descent, and among pretenders to a Crown the son of the EMPEROR has nothing to make him prominent. The Second Empire came into existence because the EMPEROR was a very remarkable man, having very special personal qualities that fitted him to aspire to power and to use it. Parties linger on long after the reasons of their existence have ceased, and the few faithful Bonapartists will scarcely endure the dulness of a life destitute of the excitement of plotting in behalf of the dynasty to which they are attached. But an amiable boy would be either the tool of a military dictator or the plaything of a constitutional Ministry; and, in either case, his rule would be entirely unlike that of NAPOLEON III. So completely must Imperialism, in the phase in which France has recently been used to it, perish with its author, that the interest felt in the career of the Empire will rapidly become historical and not political. To Frenchmen capable of reflection and of an impartial survey of France this historical interest will increase rather than diminish as time goes on. There is no question that can have so deep an importance to them as the question how it was that the Second Empire was so long and so brilliantly successful. In England there is too much readiness to supply the answer, and to say that the reason is that the French were fit for nothing better. In fact the excessive admiration felt for the EMPEROR at one time in England sprang largely from an insular contempt for foreigners; and men who would have thought the free use of the bayonet and wholesale exportations to Cayenne, and government by policemen and priests and préfets, abominable and intolerable if applied to Englishmen, calmly pronounced them exactly suited to the French, just as Scripture used to be quoted complacently in the United States to prove that GOD intended all black people to be slaves. Frenchmen will naturally hold a different language; and, distracted as France is, the best sign of the times is the general desire to show that France is fit for something much better than the Second Empire. But, to show this, something more than abuse of the Second Empire is needed; and if the judgment of posterity pronounces that the Second Empire was a brilliant but unfortunate episode in the history of France, we may be sure that it will also pronounce that many of the faults and vices of the government of the EMPEROR were to be attributed quite as much to the ruled as to the ruler.

PRIMOGENITURE AND COMPULSORY SUBDIVISION.

MR. MILL and Mr. BRIGHT have probably the same object in the letters which they have published on two different parts of the controversy on land. Mr. COBDEN'S essay on compulsory subdivision may be supposed to express Mr. BRIGHT'S opinion on the expediency of reversing the law and practice of England. Two or three weeks ago Mr. LOWE in his speech at Swindon ridiculed LORD SALISBURY'S suspicion that the Government meditated a general and minute subdivision of land. For the present intentions of the Cabinet Mr. LOWE is able to answer; but Mr. GLADSTONE'S future policy has often been indicated a year or two in advance by the late PRESIDENT of the Board of Trade. It is almost an allowable figure of speech to assert, with Lord SALISBURY, that the Government is about to do whatever Mr. BRIGHT wishes to be done. Nine years ago Mr. COBDEN, even when he composed an elaborate argument in favour of the French system, oddly remarked that no one, as far as he knew, proposed to introduce the same law into England. Since that time revolutionary projects of all kinds have become familiar; and Mr. BRIGHT perhaps intends to re-enter public life as the advocate of a scheme for the abolition of the landed gentry and of the class of tenant-farmers. Mr. MILL contents himself for the present by answering the recondite arguments of certain theorists who are inclined to discountenance any modification of the existing law on the ground that the strength of landowners would increase with their numbers. There is no doubt that, as Mr. MILL and his friendly antagonists concur in believing, the subdivision of property in France offers an insurmountable impediment to the adoption in that country of the wild projects which are from time to time advanced at Lausanne or Geneva. It is utterly useless to argue with four or five millions of French peasants in the hope of convincing them that the world would be better and happier if their little properties were administered for the general good by a benevolent Government. Discussion is not in their line, but a disputant who expressed their unconscious conviction would only reply that they care nothing about the improvement of the world, and that they will speedily dispose of any philanthropic intruder who meddles with their land. Three years ago they voted almost unanimously in favour of an absolute Sovereign who had earned their confidence by sending Socialists to Cayenne, or by shooting them down in the streets; and when M. GAMBETTA, who may perhaps sometimes talk Socialism to artisans, addresses a rural population, he is above all things careful to assure them that the Republic will preserve their property. Mr. MILL meets the objections of his Communist friends by stating his opinion that the so-called Nationalization of the land is too remote a probability to be considered in deciding on a course of political action. He would himself greatly prefer the introduction of small freeholds to the present practice, and he regards primogeniture both as unjust to younger children, who are partially disinherited, and as the basis of hereditary aristocracy. As Mr. MILL considers that the abolition or restriction of entails would not tend largely to increase the number of small proprietors, there can be no doubt that he supports the measures which are likely to be introduced by the Government, almost exclusively as steps to an entire change in the distribution of landed property.

It is surprising that an able and accomplished reasoner should attach any importance to the argument of supposed injustice inflicted on younger children. In a country where descent into a lower social rank is felt as one of the most intolerable of hardships, the custom of primogeniture is the only possible security for the continuance of families in the position which their founders have attained. Experience shows that the owner of a considerable fortune for the most part exerts himself to provide for his younger sons in professions not inconsistent with their habits and pretensions, and probably in a majority of cases all his descendants during two or three generations contrive to maintain their rank as gentlemen. It would be much more plausible to contend that primogeniture is injurious to the elder or younger sons of others than to cultivate an entirely gratuitous compassion for its immediate victims. The class of idlers living on petty incomes is less numerous in England than in France, notwithstanding the smallness of the patrimony which is commonly inherited by cadets. If all the members of families which are practically affected by primogeniture were consulted, there can be little doubt that, with few exceptions, they would approve of the maintenance of the custom. The strong feeling of the injustice of unequal division which prevails in France is founded on the experience of previous subdivision. It might be unjust, as it is apparently inconvenient, to leave to the eldest son the whole of a petty freehold, unless the younger brothers had found means to support themselves in some suitable occupation; yet the old freeholders of England habitually kept their estates undivided; and they are now gradually disappearing, not because they have been converted to the French theory, but in consequence of the increasing sacrifice of income to which all landowners are compelled to submit. Even in those parts of Kent where gavelkind has been established in case of intestacy from time immemorial, many small freeholds still exist which can only have been preserved by a deliberate adoption of the practice of primogeniture.

Mr. MILL himself probably attaches more importance to the undeniable tendency of primogeniture to create and maintain an aristocratic class than to the imaginary grievance supposed to be inflicted on younger children. Mr. COBDEN and Mr. BRIGHT never concealed their antipathy to the social superiority and political influence of the English landowners. As an ardent admirer of the Imperial system, Mr. COBDEN naturally expatiated on the attachment of the small French freeholders to order; and he perhaps willingly tolerated their notorious and entire indifference to liberty. According to Mr. COBDEN the peasants were, through their Imperial representative, saviours of that society which has, since Mr. COBDEN'S death, found it necessary to save itself with the aid of the army of Versailles. M. RENAN, who knows the French peasantry better than Mr. COBDEN, has lately published his impressions of the political blessings which follow from the subdivision of the land, and from the practical extinction of the rural aristocracy. During the war the typical Frenchman of the country districts was indifferent to the misfortunes

of the country, except when they directly affected himself and his neighbours; and in ordinary times his only preference is for the candidate who can persuade him that he will either reduce taxation or promote local improvements at the expense of the State. M. RENAN, who can scarcely be regarded as a bigoted Conservative, has only one theoretical remedy to propose for the decadence which in his opinion has already commenced; and he candidly confesses that the treatment which he hypothetically recommends is absolutely impracticable. In M. RENAN's opinion, patriotism, public spirit, and general cultivation might perhaps be revived and promoted if only it were possible to renounce equality, and by the partial consolidation of small properties to establish in all parts of the country a middle and an upper class; or, in other words, to copy the institutions which Mr. MILL and Mr. BRIGHT are impatient to demolish in England. It is not necessary to insist on an acceptance of the doctrines of M. RENAN or of any other theorist; but a writer who defies popular prejudice furnishes some evidence of the sincerity of his convictions; and it is well to remember that there is another side to the question of peasant ownership. It is not a cause for regret that Mr. MILL and Mr. BRIGHT should direct attention to the ulterior consequences which alone would make an alteration in the present law of primogeniture valuable to one party or dangerous to the other. It is now scarcely disputed that the existing law of intestacy corresponds to the intentions which would, in the majority of cases, have been formed by the deceased owner of land. Any change in the law will be inoperative, except as far as it forms a precedent or a pretext for much more sweeping legislation. If Mr. COBDEN had believed in his own curious assertion that no one meditated an alteration in the law, he would scarcely have troubled himself to collect evidence in favour of compulsory subdivision. His statement that the net produce of land is greatest in small farms is not even true of Flanders; and it is, as the Duke of SOMERSET lately stated, notoriously untrue in France. England with its primogeniture, its entails, and all the other pretended impediments to cultivation, produces larger returns in proportion to the outlay than any other country.

The revolution which would be effected by the adoption of Mr. COBDEN's theories would be startling in its magnitude. After the lapse of fifty years both country gentlemen and large tenant farmers would, with few exceptions, have ceased to exist. Whether it would be for the interest of manufacturers and other capitalists to become the sole objects of popular envy and cupidity may be advantageously considered by less passionate partisans than Mr. COBDEN and Mr. BRIGHT. It is not found that in France the law of compulsory subdivision has tended to promote harmony and good will between the rich and the poor. Perhaps the cotton-spinners may enjoy the privilege of being the last to be devoured; and the farmer will undoubtedly perish before them. It is scarcely prudent in democratic missionaries to avow their ulterior objects at the moment when, like Mr. TREVELYAN, they are exerting themselves to sow discord between landlords and tenants. It must be perfectly obvious to any intelligent farmer that the French law of succession would cut up all England, after the pattern of France, into little patches of land to be cultivated by the freeholder without hired assistance. There would be no question of compensation for unexhausted improvements or of fixity of tenure, for there would no longer be, as a general practice, either landlord or tenant. The farmers have already been warned that, in Mr. GLADSTONE's opinion, the county representation which, since the establishment of secret voting, is no longer controlled by the landlords, ought as soon as possible to be transferred exclusively to the agricultural labourers, who would form the majority of the new constituencies. The farmers are now told by Mr. BRIGHT, who is indirectly confirmed by Mr. MILL, that the democratic party think it expedient to substitute spade labour in petty freeholds for the more elaborate methods of cultivation which are peculiar to England. Perhaps it may be some consolation to cynical landowners that they are not destined to fall alone.

M. THIERS ON THE LAST DAYS OF THE EMPIRE.

THERE is no part of the evidence collected by the Parliamentary Commission appointed to inquire into the history of the late war more interesting in itself, or calculated to throw more light on the character of French parties, than that which relates to the time of feverish excitement which prevailed between the receipt of the news of Sedan and the Revolution of the 4th of September. M. THIERS more especially gives a sketch of what happened within his own knowledge, which for liveliness and pregnancy is not surpassed in the best parts of his historical writings. He had been appointed one of the Deputies who, with a certain number of Senators, Ministers, and Generals, were to form the Council of the Defence of Paris; and he took the greatest trouble to see that the most was being made of the fortifications of which he was the author, although he all along strongly insisted that, unless the army of MACMAHON was recalled to take part in the defence, instead of being sent to relieve BAZAINE, the design of the fortifications could not be carried out, and the defence must necessarily prove unsuccessful. On Thursday, September 1, the day when the battle of Sedan was fought, the Council of Defence held, as usual, an evening sitting, and M. THIERS was expressing his views with much energy, when M. JEROME DAVID gave him a mysterious hint to desist, as he had a private communication to make to him. M. THIERS obeyed the hint, left off speaking, and soon afterwards the Council broke up at one o'clock in the morning. When M. THIERS was in the street outside, M. JEROME DAVID joined him, and informed him that the EMPEROR was a prisoner, and MACMAHON mortally wounded. Overcome with the news, M. THIERS prolonged his walk, and for a long part of the night the pair paced up and down the Bridge of Solferino. M. JEROME DAVID was not there, however, solely to impart bad news; he came to prepare the way for overtures from the EMPRESS to M. THIERS, and at three in the morning a note was sent by M. MÉRIMÉE, a devoted friend of the EMPRESS, stating that he would call on M. THIERS the next day. At five M. THIERS started to inspect the fortifications, and on his return he was visited by M. MÉRIMÉE, who announced that he was authorised by the EMPRESS to ask for the advice of M. THIERS. The veteran statesman was too prudent to commit himself, and pointed out that he could not say what was to be done without becoming the Minister of the EMPRESS, which was out of the question. On Saturday Prince METTERNICH renewed the application, and met with the same answer. But at the same time that he received these flattering solicitations from the Imperial family, he received solicitations equally flattering from the leaders of the Left, to which he responded cautiously, but much more warmly. The Revolution was, they urged, inevitable, if not already accomplished, and patriotism bade M. THIERS to place himself at its head. He absolutely declined to accept the position assigned to him, but he indicated what was the course that, in his opinion, should be taken. His scheme was to make use of what he terms the repenting Corps Législatif, get it at once to declare the throne vacant, procure an armistice, enact an electoral law, and dissolve itself so as to make way for an Assembly specially called to decide on the destinies of France. The leaders of the Left did not openly assent, but neither did they dissent. They simply waited. M. THIERS is quite positive that they did not conspire, or in any way force on the Revolution. The Imperialists were equally inactive. There seems to have been a half-formed project among some of them to organize a new *coup d'état*, and arrest possibly M. THIERS himself, and, at least, all the deputies who were thought specially dangerous. But the evidence distinctly shows that the Council of Ministers never entertained or discussed the proposition. It was only a vague scheme of persons who had neither the means nor the resolution necessary to carry it out. Friday and Saturday thus passed away; the EMPRESS thinking of France more than of her family, and turning in despair to the man whom she thought capable of saving the country; the Left not provoking revolution, but thinking it inevitable; the Imperialists utterly dismayed and cowed, without resolution or capacity, or schemes bad or good; and M. THIERS courted and looked up to by every one, and with the incontestable superiority of having a definite aim before him.

Although the EMPRESS must have known the general result of the battle of Sedan on the evening of the 1st, and although many persons in Paris knew on the 2nd what had happened, it was not until the afternoon of the 3rd that the Ministers were called together by the EMPRESS to receive official information of the disaster. Every one agrees that the EMPRESS exhorted her advisers to think only of France, and not of the dynasty; and a proposal that she should leave Paris and fix the seat of her Government in some provincial town was rejected on the ground that it might lead to a civil war. The resolution to which the Ministry came was that a proposal should be made to the Assembly by which the Count of PALIKAO should be made Lieutenant-General of the Empire, the Assembly should appoint an Executive Commission, and the EMPRESS should have no other

power left her than that of approving the choice of the Assembly. The early hours of the sitting of the Assembly on the Sunday morning were consumed in debating this proposal and comparing it with that of M. THIERS, which was ultimately adopted. It was the delay caused by the discussion of this inopportune proposal that, according to M. THIERS, was the real cause of the success of the Revolution. M. JEROME DAVID, an ardent Imperialist, declared before the Commission that, even after he had two years to think over the matter, he could not see any difference between the proposal of the Ministry and that of M. THIERS. But the difference was vital; and although honest Bonapartists might have thought their proposal the only possible one, as they could not abandon the dynasty, yet it is obvious that the proposal of the Ministry was meant to maintain the Empire, while that of M. THIERS treated it as at an end. If the proposition of M. THIERS had been carried at an early hour, and immediately made public, the Assembly would have anticipated the Revolution by declaring the Empire at an end, would have assumed a legal authority that would probably have been recognized, and might perhaps have made way for a new Assembly that would have terminated the war. But while the details of the proposal were being considered in the Bureau to which they were referred, and M. THIERS was just putting the finishing strokes to his draft, the crowd burst in, and the Assembly broke up. The leaders of the Left went to the Hôtel de Ville, and there accepted or seized on the functions of a new Government. M. THIERS throughout speaks in a tone of the greatest friendliness towards the leaders of the Left. In his eyes, after the folly of the Bonapartists had made impossible the only true plan for the safety and good of the country—that of concentrating all power for the moment in the Assembly—it was the course taken by the leaders of the Left, and that alone, that preserved Paris from then and there falling under the dominion of the Commune. It is true that by a concurrence of unfortunate circumstances the Chamber was left unprotected by soldiers, and this led to the total absence of all resistance which the mob experienced. Whether this was the result of an unlucky mistake, as M. THIERS suggests, or was the fault of General TROCHU, as the Bonapartist witnesses plainly declare, is not now of very great importance. The essential point is that the opportunity of anticipating the Revolution was lost, because the Bonapartists, from natural and honourable motives, could not bear to seem to be giving up the Empire altogether, while the EMPRESS, though sincerely anxious to consider nothing but the interests of France, could not be expected to insist herself on abdicating without the step being suggested to her as necessary in the interests of the country.

M. THIERS, after the Government of September was formed, retired to his beloved studies, as he tells us, and fondly hoped that he might be left undisturbed. But this was not to be, and that appeal was made to his patriotism which led to his going the round of Europe in search of support for France. In the short time—it was only two days and a half—that elapsed between his receiving the news of Sedan and his finding a Revolution of which he disapproved successful, he showed quite enough of the real bent of his mind and character to make it clear what would be his course in any moment of emergency. It is this that connects these historical memorials with current politics. What M. THIERS tried to do and to avoid doing then, he has tried to do and to avoid doing ever since. He then found himself lifted into eminence because Bonapartists and Republicans both needed him, and both were willing to purchase his support on almost any terms. He kept aloof from both, striving to establish something in the way of a Government that would do for the moment, engage the attention of the nation, and preserve the general respect for legal authority. He was inclined to spare the vanquished Imperialists as much as possible, and he always spoke of the EMPRESS with the utmost respect. On the other hand, he was on the most friendly terms with the leaders of the Left, and now speaks of them as of persons who rendered France a great service. But he meant, if he could, to get the Imperial dynasty quietly out of the way, and to keep the reins of government in the hands of men accustomed to administration, but whose political principles were far aloof from those of the supporters of the Left. He acted then, in short, very much as he is acting now. He made use of a repentant Corps Législatif just as he does now. He is willing to be on fairly good terms with the Right so long as he can keep them from being outrageous and fanatical. At the same time he let it be clearly understood that the leaders of the Left were so far from being Communists that they were the saviours of Paris from the Communists. Thus, useful to all parties, and polite and conciliatory even to those who opposed him, he nevertheless, partly by adroitness, partly by superior insight into affairs, kept himself clear of the blunders into which others were falling, and placed before himself a definite and practicable aim, although the aim was but the temporary one of getting France to adopt a policy that would enable it to surmount a special crisis. It is scarcely too much to say that, whatever might have been said of M. THIERS then may be said of him now, although the parties with which he has to deal, and the crisis which he is endeavouring to help France to surmount, are obviously of a very different character.

THE WELSH COLLIERS' STRIKE.

THE strike of the ironmasters' colliers in South Wales has happily up to the present time not been accompanied either by disturbance of order or by violation of contract. It is not disputed that the men had a right to leave the pits in preference to accepting the proposed reduction of wages by ten per cent. It seems to be assumed that their determination is approved by the thirty thousand or forty thousand iron-workers who are thrown out of work by the discontinuance of the supply of coal; and the colliers are entitled to act exclusively with reference to their own interests, even if their refusal to work indirectly affects the interests of their neighbours. Even if it were clear that the strike was unjust to the employers or to any other class, it would be useless to treat a conflict of forces as a subject for moral reflections. It is much more certain that the strike is a misfortune than that it involves any culpability on either side. The Welsh ironmasters will lose profits corresponding to a payment of wages which cannot have been less than 100,000*l.* per week; and the consumers, who must draw their supplies from other districts, will find that diminished production is represented by increase of price. It seems that the majority of the colliers will for the present receive from their Union a sufficient allowance to secure them against extreme want; but the iron-workers, having for the most part no reserve funds, must depend in great measure on the voluntary liberality of Trade Unions. The whole social economy of the district will be deranged, or rather paralysed, by the stoppage of the payments on which the miscellaneous population depended for subsistence. It is not surprising that the shopkeepers who supply the wants of the workmen should be alarmed at the strike, although their offer to mediate between the contending parties was unauthorised and useless. The promoters of the strike hold out to the men hopes of finding ready employment in other parts of the country, and large numbers have already gone either to the steam-coal pits or into England in search of work. It remains to be seen whether the Council of the Miners' Association, which has through its Chairman actively encouraged the strike, represents the feeling of the general mining population. The colliers in all parts of the country have for more than a year exerted themselves to restrict as far as possible the output of coal, by refusing to work for more than three or four days in the week. It will be not a little surprising if they welcome the arrival in their respective districts of hundreds or thousands of skilled competitors who had up to this time worked for the South Wales ironmasters. Perhaps it may be cheaper to admit new workmen into the pits than to maintain them in idleness by levies on their own wages. It is not known whether the masters will offer any impediment to arrangements which tend to the success of the struggle against other employers.

There is nothing more remarkable than the docile unanimity with which large bodies of workmen invariably submit to the dictation of their leaders. In Trade Unions, as in political communities, large democratic bodies seem to be incapable of independence or originality, although they exert the vigour in action which results from discipline or passive obedience. A deliberative body not reduced to impotence by equality and universal suffrage would certainly have paused before it resolved on the dangerous experiment of closing the South Wales iron works. The statements which had been made by the masters were, greatly to the credit of the men, accepted with little hesitation as probably true, but a few words from the recognized leaders were sufficient to confirm a resolution which had been originally formed on the opposite assumption. It had appeared from published returns that the condition of the trade was highly prosperous, and that the proposal to reduce wages was consequently inequitable; but the masters assured a deputation of miners that the published figures were incorrect; and they offered to allow an inspec-

tion of their books in proof of their assertion. The delegates admitted that, if the statements of the masters were true, the reduction would be justifiable; but they alleged, with some plausibility, that miners would not be able to understand commercial accounts, and they ultimately insisted that the questions in dispute should be submitted to arbitration. The masters rejoined by a refusal to adopt a practice which, according to their statement, had failed in the Northern districts; and, on the report of the delegates, a general meeting, at the instigation of the leaders, at once determined to persevere in the strike which had been projected before a doubt was thrown on the accuracy of the published returns. No serious attempt was made to effect a reasonable compromise by inducing the masters to allow an inspection of their books by skilled accountants, whose inquiries might have been confined to the single point in dispute. It appears that the miners themselves entertained no serious doubt of the accuracy of the masters' statement, although the Chairman of the Miners' Association, who seems to have been the principal promoter of the strike, advised the men not to accept the assertion, which he described as the masters' *ipse dixit*. If the proceedings are accurately reported, the momentous decision to precipitate a rupture appears to have been adopted on the assumption of the falsehood of a statement which the bulk of the meeting believed to be true. In all such disputes there are elements familiarly known to both parties to which it is deemed inexpedient or unnecessary to refer in public discussion. A rumour that the workmen desire to ascertain the state of the masters' accounts during the last seven years suggests an explanation of the refusal of the men to accept the offer of inspection, and of the unwillingness of the masters to submit their books to professional examination. Mr. HALLIDAY, while he repudiates any desire to open up the accounts for seven years, admits that the miners proposed to investigate the whole of the books for one year. Their object was probably to prove that, although prices may now have been reduced, the profits of the early part of the year ought to be set off against the results of the present state of the market. An entirely different issue had been raised by the men when they resisted the ten per cent. reduction, on the authority of the published returns. Mr. HALLIDAY's demand is consistent with the accuracy of the statement made by the masters, and it involves the principle that after a season of prosperity employers ought in certain cases to continue their undertakings at a loss. It sometimes happens that preliminary negotiations are conducted, not for the purpose of effecting a settlement, but as manœuvres by which both parties endeavour to place their adversaries in the wrong. When employers on the eve of a struggle find that their workmen are directed by professional agitators, they have good reason for suspecting that overtures for compromise are not likely to lead to any useful result. The summary decision of the public meeting had evidently been arranged beforehand by the leaders; and possibly the masters may have previously ascertained that the strike was inevitable in default of their withdrawal of the notice of reduction.

At their interview with the delegates some of the iron-masters remarked that, in consequence of the falling off of workmanship, a larger quantity of pig-iron than formerly was now used in making a ton of rails. It seems also to have been hinted that high wages had led to idle habits and to increased intemperance. A Baptist preacher, who afterwards addressed the meeting of miners, indignantly protested against an imputation on a body of men whom he so deeply loved and respected. Sectarian eloquence is naturally regardless of facts; and the colliers themselves are more candid than their over-zealous advocate. If the Welsh colliers have not idled longer and drunk more during their season of prosperity, either they must have been more industrious and more temperate than the members of the same class in England and Scotland, or employers and disinterested observers must have been engaged in a wanton and general conspiracy to calumniate the whole mining population. It is true that colliers, like other men, are free to work at their choice, and to spend their earnings as they please; nor would it have been judicious on the part of the masters to make censorious remarks on the private conduct of the workmen; but, if it is true that the quality of the work has declined, the deterioration bears directly on the amount of profits, and therefore on the proposed reduction of wages, although the charge is brought, not against the colliers, but against the iron-workers. Any deficiency or irregularity in the supply of coal to the works would also be material to the controversy. Unless there are peculiar conditions which affect mining labour in South Wales, the colliers might, if they thought fit, increase their incomes by working for a longer time in the week; but in this respect, as in other matters, they have a power, and therefore a right, to exercise their own discretion. It is certain that they would refuse to refer to arbitration the question whether they should work every day in the week. The masters in their turn have probably good reasons for declining an indefinite jurisdiction which is vague without being exhaustive. There are perhaps cases in which arbitration may be suitable for the determination of some simple issue between employers and workmen; but until a fixed proportion of wages to capital and profits has been established by common consent, it will be impossible to conduct industrial operations under quasi-judicial control.

The South Wales strike, if it proceeds, will probably throw some light on the vexed question of the advantage or disadvantage to workmen of such proceedings. Many economists have shown plausible reasons for believing that more is lost by interruption of labour than is on the average gained by the additions to wages which sometimes result from strikes. If the South Wales miners and iron-workers with their families depended wholly on trade contributions for their support, the funds of the Union, even with the aid of the voluntary contributions which may be expected, would not be sufficient to maintain them for many weeks; and the funds which will necessarily be expended have been accumulated by payment of a percentage on their former earnings. As a large number of the men will probably find employment either in the Welsh steam collieries or in the English iron districts, the burden on the funds of the Union will be proportionally diminished, and the men who find work will subscribe towards the maintenance of their less fortunate companions; but it may be confidently asserted that the cost to the men and to the Union of the strike will enormously exceed the amount of ten per cent. on three months' wages. The consumer, who will be the ultimate sufferer, is naturally treated with equal contempt by masters and workmen. In trade conflicts, as in war between nations, the principle at stake may sometimes be worth a heavy sacrifice; and perhaps the knowledge that strikes are possible may on the whole have the effect of raising or sustaining the general rate of wages. If the more direct results could be accurately compared with the expense incurred, the balance would almost certainly be against the Unions; and there can be little doubt that the South Wales miners and iron-workers will suffer by their decision, though they will have the satisfaction of causing heavy loss to their masters, and of raising still further the price of iron and of coal, at the expense of the general community.

THE ASSEMBLY AND THE THIRTY.

THE National Assembly met again on Monday. The perfect quiet which France has enjoyed during the recess may convey a useful lesson to the Conservative leaders. They are exceedingly fond of representing themselves as the only safeguard of public tranquillity. Were they to leave the country in the grasp of the PRESIDENT, his desire to conciliate the Radicals would lead to the overthrow of law and order, of family purity and religious belief. It is essential, therefore, that his hands should be securely tied, and that his Ministers should be men whom the Right can absolutely trust. The Christmas holidays interrupted them in the search for a set of fetters which should answer this indispensable purpose. For three weeks M. THIERS has had everything his own way. He has held official receptions in Paris, and betrayed his revolutionary sympathies by talking to M. GAMBETTA at an evening party. The nature of the case would seem to require that throughout this interval the country should have been extremely uneasy. Its natural protectors were keeping Christmas in their own homes, while the PRESIDENT was exchanging civilities with men who do not believe in a Conservative Ruler of the Universe, and would like to dine off roast priest. Here was an occasion for conspiracies of every kind. It is doubtful whether, on their own showing, the majority ought to have consented to an adjournment: whether they ought not to have outwatched the stars even at Christmas, in order to save France from the Radicals. Their omission to do this ought at all events to have condemned their constituents to a fortnight of irrepressible anxiety. Instead of this, the French people seem decidedly more at their ease when the Assembly is not sitting. It is when the Assembly meets again that they grow uncomfortable. The chiefs of the majority will be loth to draw the inference which they ought to draw from this curious contradiction. They would like to go on making disturbances in the interests

of public tranquillity, and unsettling even the little that can be called established in France in the interests of social order. They believe themselves, as we learn from M. DE LARCY, to be the objects of a special divine protection, and their idea of making the most of this advantage is to use it to weaken the authority and influence of the powers that be. It is probable, however, that Providence will be better to them than they deserve, and will once more temper their valour with the discretion that is born of irresolution. The leaders of the Right would like to believe that the good sense of the Chamber is altogether identified with their policy; that whatever they decree to be necessary for the maintenance of law and religion will be accepted without question by all who profess and call themselves Conservatives. But they can hardly avoid seeing that there is very little of this uncalculating submission in the ranks of the majority. Though they can command an occasional triumph, they cannot trust their own supporters. An alternative theory of Conservative duty challenges their allegiance at every turn; and if their first thoughts are with the Right, their second thoughts are sure to gravitate towards the Centre. They see a Government which has proved its strength by putting down a formidable insurrection, and its moderation by acting in harmony with the Assembly so long as the Assembly was acting in harmony with the country. They see that this Government has attracted to itself an amount of support which gives it a better chance of maintaining its ground than any rival can at present hope to command. They see Republicans drawn to it by the frankness with which it has christened itself Republican. They see men who have hitherto been at heart Monarchists drawn to it by the fact that it gives them the essentials which are all that they have really valued in Monarchy. They see that the desire of the Right is to prevent this Government from consolidating itself any further, to allow a time of exceptional quiet to pass away unused rather than allow its fruits to be gathered in for the benefit of the Republic. They know that among their nominal guides are some who have an obvious motive for counselling delay. They can understand that the partisans of fallen dynasties are not likely to look with composure upon a settlement which commits the work of restoring tranquillity to France to other hands than theirs. It is hardly possible that, when these ideas have once rooted themselves in their minds, they should not breed distrust and apprehension. If they allow the leaders of the Right to wield the whole strength of the Conservative party in the Assembly, have they any security that they will wield it for Conservative as distinguished from dynastic ends? The two are not necessarily identical; on the contrary, they are in some respects plainly opposed to one another. Nothing could be more discouraging to a Restoration, whether Legitimist or Orleanist, than the discovery that all the material and social advantages which had been expected from it had already been obtained under a Republic. Consequently the nearer a Republican Government comes to securing these advantages, the more eager will conscientious Monarchists be to prevent its definitive establishment. Men who believe that the only hope for France is in a Restoration will naturally be anxious to save their countrymen from being deceived by appearances. The more successful the Republic is in disguising itself as an angel of light, the more incumbent it is upon them to make it appear in its real character. There must be many men amongst the nominal majority arrayed against M. THIERS who have been, or will be, led by these considerations to question their own wisdom in strengthening the hands of the Right. Whether they do or do not succeed in influencing the action of the Committee of Thirty, they can hardly fail to influence, or rather to determine, the action of the Assembly to which the Report of this Committee will be addressed. If a consciousness of this fact can be infused into the Committee, some trouble and some scandal may be saved; and for this reason M. THIERS will probably go on preaching compromise and conciliation whenever he can gain a hearing. But he can hardly feel much anxiety as to the ultimate event, even if his counsels are altogether disregarded. The Thirty may recommend the Assembly to keep the government of the country in its present provisional and unsettled state, rather than allow it to be consolidated under the guidance of Conservative Republicans. But the Assembly will probably consider that the bird in the hand which M. THIERS holds out to them is worth any two which can be offered by the partisans of the rival pretenders.

It would not be surprising if, under these circumstances, the majority of the Committee should try to borrow M. THIERS's strategy, and to keep the present state of things in being, not by refusing to recommend a substitute, but simply by delaying to produce one. Two draft Constitutions have already been laid before the Second Sub-Committee, and if the details of these projects are to be properly considered, there is no reason why the deliberations of the Thirty should not be extended over the rest of the Session. There would be a certain ingenuity about this policy which might make it attractive in the eyes of politicians who felt assured that a bolder line would fail of its object. So long as the Committee is sitting M. THIERS will desire to make his conduct of affairs as palatable as possible to the party which it represents. It is not until it has finally reported against him that he will care to throw away a chance of bringing it to report in his favour. For the rest of the Session, therefore, the good will of the Executive is assured, and, with the prospects of Monarchy so desperate as they now appear, a six months' reprieve is worth playing for. The chapter of accidents may have little in store, but when there is nothing else to trust to, it is well not to close it a moment earlier than can be helped. From these calculations, however, one important element is omitted. M. THIERS has largely used delay as an instrument in the prosecution of his own designs, but he may not be equally patient of it when it is employed by hostile hands. It is his interest at present to keep the Committee and the Right in good humour. But supposing it to become clear that the Committee are only playing with him, the motive for his forbearance will be gone, and the forbearance will probably be found to have gone with it. M. THIERS can at any moment make a proposal to the Committee, and request an immediate report upon it. If that request is refused or played with, he can at once paralyse the Thirty by introducing his project in the Assembly itself. An open breach between the PRESIDENT and the Thirty, founded on the unwillingness of the latter to do the work they were appointed to do, would bring to a head all the doubts and apprehensions on the part of the majority which have been already set forth, and would tend almost to a certainty in all probability to unite all the moderate sections of it in their old attitude of puzzled submission to M. THIERS.

LOCAL TAXATION.

A SCHEME of local taxation propounded on the same authority which has lately sanctioned the abandonment of Canada, the abolition of the Church, and the commencement from the 1st of January of a new and original political era, may be regarded as the reduction to utter absurdity of the changes which have been threatened by Mr. GLADSTONE and Mr. GOSCHEN. Landlords and tenants have often jointly preferred a plausible complaint of the injustice which they suppose themselves to suffer through the exemption of personal property from liability to rates; but neither party objected to the division of the burden between themselves, or to the machinery by which it was effected. Ordinary statesmen would have either denied or acknowledged the existence of the alleged grievance; and, if it was well founded, they might have endeavoured to devise some mode of redress. Unluckily landowners and farmers have too frequently concurred not only in grumbling about rates, but in electing members to oppose Mr. GLADSTONE; and consequently it was deemed expedient not only to deal with the fiscal question, but to sow, if possible, dissension in the hostile ranks. Accordingly Mr. GOSCHEN's Bill of 1870 provided for a partial transfer of the payment of rates from the occupier to the owner; and it was only on second thoughts that Mr. GOSCHEN condescended to recognize the force of existing contracts. Probably no precedent can be found of a project of unjust legislation so apparently contrived for party purposes; but it is highly probable that a general election under the Ballot will justify the official calculation. The agitation against the present system of rating was injudicious as far as it related to the incidence of local taxation, although a question might fairly be raised as to the proper distinction between local and Imperial purposes. The Poor-rate, which has served as a precedent for all other local taxes, was at first indiscriminately imposed on the substance of the parishioners. In practice it was found convenient to levy the rate only on lands and houses; and long continuance has, as in all similar cases, practically removed the inequality of the impost. All existing tenants and nearly all existing proprietors have acquired their land by contracts in which the exclusive liability of realty to rates was one of the express or implied conditions. On the other hand, fund-holders and shareholders have given larger prices for investments which were by law or practice exempt from

local taxation. Strong reasons ought to be given for a readjustment which amounts to an increase or decrease of the relative value of different kinds of property; nor indeed would the controversy probably have arisen but for the expensive improvements in administration which have been of late years effected at the cost of the ratepayers. The expense of the administration of justice, and some other charges of the same character, are not incurred for the exclusive benefit of the inhabitants of the district where they have been incurred. In some instances the claim of the ratepayers to relief has been recognized by law; and the majority of the House of Commons which carried Sir MASSEY LOPES'S resolution apparently thought that the Imperial revenue ought to make further contributions. For sanitary expenditure, more especially in towns, the ratepayers may be considered to have received full consideration.

The Ministers are perhaps scarcely to be congratulated on the advocacy of an enthusiastic partisan who in his eagerness generally overruns the scent. When Mr. GOSCHEN lately made an offhand suggestion that corporate lands should be compulsorily sold, his loquacious followers immediately expatiated on the expediency of depriving country incumbents of their modest glebes. In the same spirit the project of transferring half the rates from the occupier to the owner is travestied by a thoughtless journalist into a scheme for making the average rates of the last seven years a rent charge upon all rural land. The tax has, it seems, become public property, to be held henceforth in perpetual mortmain. That liability to rates depends exclusively on the public wants for which it is necessary to make provision, is a consideration which has apparently not occurred to the ingenious projector. It is at least conceivable that the Poor-rates, which still form the heaviest part of local charges, might be largely reduced, at the expense perhaps of the ratepayer, who, through an increased demand or diminished supply of labour, might have been compelled largely to increase wages. If the average rate is public property in 1873, it was equally public property in 1833, immediately before the enactment of the present Poor-law, when the rates in some parishes were equal to the rental. On precisely the same grounds it might be contended that the Income-tax of 4*d.* or 6*d.* or 7*d.* in the pound might at any given time have been equitably converted into a permanent charge on land, on dividends, or on trade profits. There is no reason why Parliament should not exercise full discretion in the selection of the classes which are to be liable to rates imposed for any new purpose of public utility. The older rates are quite as likely to be diminished as to be increased; and it would be monstrous to deprive those who pay them of the benefits which may result from their own good fortune or skilful administration. Perhaps it may scarcely be worth while to expose the absurdity and injustice of a scheme which probably results, like other recent suggestions of equal value, from the audacity of inexperience; but it is barely possible that the projector may be only a too zealous exponent of official doctrines.

In all recent schemes for the re-arrangement of local taxation it is proposed to deal with houses and land on different principles. There may perhaps be some pretext for a distinction which nevertheless ought to be jealously watched. It has often been asserted that, through the rate on houses, the balance between the liabilities of real and personal property is in some degree redressed. Rich men who have not an acre of land live in large houses which are rated in proportion to the rent; and it has often been said that a house-tax, or a house-rate, is a rough approximation to an income-tax; yet it is also true that the burden is partially shared by the landlord. If all rates on houses were payable by the ground landlord, or by the intermediate lessor, the occupier could afford to pay a higher rent; but the majority of economists maintain that the burden is not in the case of houses, as in the case of land, exclusively imposed on the freeholder or on the immediate landlord. As houses are generally let by the owner of the soil for long terms of years, it is evident that he contributes nothing to any unforeseen increase of rates during the continuance of the lease; but a prospective possibility must, like any other element of value, be assumed to have been taken into consideration by the parties to a contract. Where the rates have increased in the large proportion described, with some exaggeration, by Mr. RATHBONE in his paper on local taxation in Liverpool, a plausible case may perhaps be made for the transfer to the owner of any part of the charge which tends, through the purposes to which it is applied, to increase the value of his property. Mr. RATHBONE'S statistical tables would probably explain the causes of the increase of rates, some of which, such as the cost of public parks, are perhaps in the nature of interest on the purchase money of valuable property. If the transaction has added to the selling price of the reversion, it will be for the freeholder to show cause against his liability to a portion of the rate. No Ministerial Bill will do injustice to householders in boroughs, or to 12*l.* householders in counties, because both classes have votes to give to Ministerial members. Rural landlords, on the other hand, have a fatal propensity to distrust Mr. GLADSTONE, and the number of large town proprietors, or of capitalists who have invested their money in ground rents, is too small to entitle them to any extraordinary share of justice.

There can be no doubt that, notwithstanding the natural process by which the incidence of taxation tends to adjust itself, the interference of the Legislature may sometimes be necessary or desirable. When the administration as well as the contribution of taxes is local, it is important that those who manage the expenditure should be identified in interest with the taxpayers. The contrary result would be produced in naked absurdity if the preposterous plan of charging the existing rates in perpetuity on the land could by any possibility be adopted. The distribution and application of the proceeds of taxation would necessarily remain in the hands of the occupiers, who would have no motive for reducing the rates below the fixed amount of revenue at their disposal. They would also be comparatively indifferent to an increase of parochial burdens which would, in accordance with the established precedent, be after a short interval added to the rent charge. Even if the gross injustice of the plan were left out of consideration, the carelessness of administration which must necessarily ensue would afford dangerous encouragement to pauperism. It may be inferred from the provisions of Mr. GOSCHEN'S abortive Bill that some illusory pretence of representation will be offered to landowners in consideration of the burden to which they are to be wantonly subjected; but where two classes combined in a single body have opposite or even separate interests, the right of voting in a standing minority is absolutely worthless. It is well known that *ex-officio* Guardians are powerless in their Boards whenever a question arises on which justices and elected Guardians are influenced by different feelings and motives. The strictness and frequent unfairness with which the clergy are assessed to the rates affords a familiar illustration of the spirit in which Boards of Guardians or Vestries would levy rates from landowners. If any readjustment and division of burdens can be shown to be equitable, it would be much better to apportion some special rates exclusively to owners than to charge them with a moiety of the whole amount. The highways would probably be better kept than at present if they were maintained and managed by the resident representatives of the landowners of a district; nor would it perhaps be unreasonable to charge the freeholder with the cost of new and permanent sanitary improvements, although in this instance the administration would necessarily belong to the Board of Guardians. The assessment of rates imposed exclusively on owners should not be subject to the caprice or wilful unfairness of occupiers and their nominees.

THE DISSENTERS AND THE GOVERNMENT.

THERE can no longer be any doubt as to the manner in which the Nonconformists would receive the alteration in the 25th clause of the Education Act which was foreshadowed by Mr. HIBBERT the other day. In a letter to a contemporary the Chairman of the Executive Committee of the Education League has declared that he will have none of it, and upon this point he may be supposed to speak the mind of Dissenters generally. He can hardly bring himself to believe that a proposal that the fees for the schooling of the children of indigent parents shall be paid by the Guardians will be seriously entertained, but he is quite certain that its adoption by the Government "would be such a proof of incapacity to com-" prehend, or unwillingness to meet, the scruples of Dissenters " as would finally discharge them from all the obligations of " party loyalty." One is almost tempted to wish that the Nonconformist Liberals would take their discharge and provide themselves with a new sovereign. Nothing else will convince them how greatly they have overrated their strength in the country. They seem resolved that, unless they can have things their own way, nothing shall be done for elementary education. They justify this determination on the ground that a great principle is involved in the opposition to the 25th clause. But to maintain this position successfully the principle in question must be one of which the public can

be made to see the importance. There are persons who hold that a great principle is involved in the opposition to compulsory vaccination, but they are fined for their obstinacy all the same. If the Dissenters were to carry out their threat of secession, they would in the end be the chief sufferers.

Unfortunately it is not only the prospects of a particular party, or of a particular section of a party, that are affected by this controversy. The Dissenters might turn the Liberal Government out of office, if they have the will and the power to do so, without any worse result than to bring back to the party many who have been driven away from it by the violence of these very malcontents. But the cause of elementary education suffers whenever political or ecclesiastical passions are imported into a subject which ought by rights to be entirely free from them. It is this reflection that leads reasonable politicians to go on searching for compromises in spite of so many declarations on the part of the Nonconformists that no compromise is possible. It is remarkable that Mr. CHAMBERLAIN should not have taken the trouble to understand the proposal which he sets himself to denounce. It is not true that if the change were effected the money "would be applied to the same object in the same way." It would no doubt be applied to the same object—the object, that is, of providing secular instruction for children whose parents are too poor to provide it themselves. But it would not be applied in the same way. As the 25th clause stands, the school fee in the case of such children attending Denominational schools is paid by the School Board. The consequence is that the Board has full notice of the use to which the money is applied. If the inability to pay school fees were put on the same footing as the inability to provide for a child's physical wants, the Board of Guardians to whom the matter would then be handed over would have no such notice. They would give the parent money to pay the school fee just as they give him money to buy groceries. Or, more accurately, they would not give him money for either purpose as such, but generally for the supply of his necessary wants. There would be nothing in this to "carry sectarian conflict and strife into the election of another "group of public bodies," or to "place the magistrates, the "Guardians, and the School Boards in a position of constant "antagonism." No doubt, if the Guardians were ordered to pay the fees for the children of outdoor paupers attending voluntary schools, an effort might be made on the part of the Dissenters to elect Guardians who would pledge themselves to disobey the law. But if the Guardians were simply ordered to include inability to buy a child's schooling among the wants which confer a title to relief from the rates, it would be no more their business to inquire where the parent buys it than it is to inquire where he buys the bread which he is at present bound to provide for his child. The School Board would take care that the child attended some efficient school; the relieving officer would take care that no parent was helped to send his child to an efficient school unless he could not do it without help; the Guardians would deal with cases in which such inability was proved to exist, just as they now deal with other forms of inability to provide necessaries. At what stage of this process does Mr. CHAMBERLAIN see any loophole for the introduction of sectarian conflict?

Nor is there anything more substantial in the notion that such a plan would "secure the education of the child only at "the price of the degradation of the parent, forced to accept "a relief which is humiliating to him, in the discharge of a "new obligation which the law imposes, but which his re-"sources are insufficient to provide." Mr. CHAMBERLAIN argues as though the new obligation were some work of supererogation imposed upon the parent by the law. Once admit that the enactment of compulsory school attendance is only the formal recognition of a moral obligation which has always existed, but has not hitherto been enforced, and there is no ground for distinguishing between this and the obligations with which the parent is already saddled. Why, for example, does not Mr. CHAMBERLAIN extend his objection to the Poor-law as a whole? Why does he not speak of it as securing the life of a child only at the price of the degradation of the parent, forced to accept a relief which is humiliating to him in the discharge of an obligation to give his children food, which the law imposes but which his resources are insufficient to provide? The cases are parallel if it is conceded that moral and physical want stand on the same footing, and that it is as much the duty of the parent to give his child a certain minimum of education as it is to give him a certain minimum of food. If Mr. CHAMBERLAIN denies this, he cannot be a consistent supporter of compulsory education. If he admits it, why should relief be given under one name where food is concerned, and under another name where schooling is concerned? Whatever degradation there is in a man's accepting relief from the rates consists in the inability to make a livelihood by his own labour, and this will not be lessened by calling the relief remission of school fees instead of parish allowance. It is strange, again, that Mr. CHAMBERLAIN does not see that, so far as this objection is concerned, it makes no difference whether the 25th clause be retained, or repealed, or modified. It is not the mere necessity of paying the school fee that will ordinarily drive a man to seek relief from the rates. The necessity of doing without his child's earnings, and of providing him with clothes which he need not have had if he could have been kept at home, will constitute a far heavier burden, and one that will be imposed on him without any reference to the 25th clause. If School Boards do not save him the humiliation of accepting relief on these grounds, it will be a matter of small moment that they remit a school fee amounting to a penny or twopence a week.

It must be confessed, however, that Mr. CHAMBERLAIN'S letter makes it doubtful whether anything will be gained by continuing the search for a *modus vivendi* with the Dissenters in the direction indicated by Mr. HIBBERT. It is not a sufficient recommendation of a compromise that nothing can be urged against it. The object of putting it forward is to conciliate opponents, and if it is clear beforehand that it will not conciliate them, it is only so much trouble taken in vain. While regretting on all grounds that the Dissenters should be as impracticable as Mr. CHAMBERLAIN makes them out to be, we agree with him that it would be wiser for the Government to refuse to deal with the question at all than to propose a change which would leave them as discontented as ever.

IRONCLADS AT SEA.

AT the end of last week two uncomfortable bits of naval news were published about the same time. From Portsmouth it was reported that the men of the frigate *Aurora* had mutinied, while from Gibraltar came the news that the ironclads *Northumberland* and *Hercules* had put in there very much damaged by a collision off Madeira. There seems to be no reason to suppose that the disorder on board the *Aurora* was anything more than a passing fit of ill-temper on the part of the men. The officer in command thought that some of the work of the ship had been neglected, and stopped all leave. This, it was said, was punishing the innocent as well as the guilty, and the crew showed their resentment by making a great noise, pitching the guns about, and even threatening to fling one into the engine-room. Nothing tries the temper of sailors so much as stopping leave suddenly, especially during holiday time, and this is certainly not the first occasion on which such an order has led to disturbances. What irritates the men is, we suspect, not merely that they are cut off from a pleasure to which they have been looking forward, but that they feel they are humiliated in the eyes of their friends on shore. In the present instance we have no means of knowing whether the punishment was really called for; but in any case there can be no doubt that the men afterwards behaved very badly, and that anything in the nature of a mutiny requires to be sharply dealt with on board a man-of-war. If the ringleaders could be discovered, especially the man who suggested the pretty sport of throwing a heavy gun into the engine-room, it would be necessary to make an example of them; but it seems to be very doubtful whether they will be discovered. The lights were put out when the row took place, and none of the mutineers can be identified. Happily there is no evidence of preconcerted action in the affair, and indeed the crew had only just been brought together, and had hardly had time to get acquainted with each other. The other piece of news to which we have referred is of a much more serious character. On Christmas Day the ironclad squadron at Madeira had just returned from riding out a gale at the back of the island, and the weather was still rough. The *Northumberland* parted her cable in a heavy squall, and, although another anchor was promptly let go, she drifted with rapidly increasing speed and momentum towards the *Hercules*, which was lying some five hundred yards off. Before she could be brought up, she was, as one of the officers described it, "on "the top of the *Hercules*." Some injury was done to the latter, but at first it was supposed that the *Northumberland* had escaped from the encounter with nothing worse than a few scratches. Next morning a "good list of the ship to "port" was observed, and it was then discovered that two of the compartments on the port side were full of water. The

Northumberland had in fact rammed herself on the *Hercules's* prow. The prow had penetrated her water-plating, and made a hole four or five feet deep and eighteen inches broad—a hole certainly "not so deep as a well nor so wide as a church-door, yet enough." It was enough at any rate to make the Admiral feel uncomfortable, and the injured ships at once made all speed for Gibraltar. The danger to the *Northumberland* was of course lessened by the fact that she is built in compartments, so that, even if one or two compartments should be pierced and fill, the other compartments are sufficient to float the ship. At present it is impossible to ascertain the full amount of damage which has been done. Besides the fracture in the outside skin, two leaks had been observed where the inner skin joins the iron beams, and it was naturally suspected that the beams had been injured.

If this accident stood alone, it would not perhaps so much matter. Accidents, it is said, will occur in the best regulated families; but when accidents are constantly occurring in a family, it may be reasonably doubted whether it is regulated in the most perfect manner. It cannot fail to be observed that the collision between the *Northumberland* and the *Hercules* is only one of a series of disasters. Out of a squadron of six vessels, two are ordered home for repairs, and two others are said to be "shaky about the bottom." The *Northumberland* impales herself on the *Hercules*, the *Bellerophon* jostles the *Minotaur*, and the *Sultan* scrapes the ground and is found to be "shaky" too. And not long before all this we have the *Agincourt*, the sister ship to the *Northumberland*, run on the Pearl Rock, and the *Lord Clyde* aground in the Mediterranean; and only a little further back the *Captain* capsized. Of course we are quite prepared to find that it is possible to take a cheery and hopeful view of these disasters. Indeed, nothing would surprise us more than not to be assured on the highest authority that accidents of this kind are rather proofs than otherwise of wise administration, perfect seamanship, and a peculiarly scientific way of building ships. Everything that has occurred no doubt admits of the simplest explanation; but ordinary people may be pardoned for feeling uneasy when so many unpleasant things of the same sort keep on happening one after the other. Of course there will be an inquiry into the bumping of the *Northumberland*, with another big Blue-book, and a solemn official minute by "My Lords." Last year we had the *Megæra* inquiry, and nothing could be more instructive. It was shown in the clearest way that it is morally as well as physically impossible for anybody connected with the navy above the rank of a deputy-assistant understrapper of one kind or another to do anything wrong.

We shall certainly not presume to anticipate the result of the inquiry into the collision between the *Northumberland* and the *Hercules*, but there are one or two tolerably obvious considerations which must strike every one. One of the officers of the *Northumberland*, in a letter which has been published, blames the Admiralty for sending the ironclads to such an anchorage as Funchal, "no better than "the middle of the Atlantic," with the additional peril of being driven on shore if a cable breaks or the anchor does not hold. Last year, he says, the fleet was put in jeopardy at Teneriffe, and two years before at the Azores. Ironclads are costly articles, and we certainly cannot afford to have ships which are worth from half to three-quarters of a million knocked about off dangerous coasts, as if they were cheap wooden vessels of the old school. It can hardly be said that ironclads require seasoning in this way, and seamanship might perhaps be learned under less risky circumstances. On the other hand, assuming that Funchal is such a bad anchorage that the *Northumberland* should never have been sent there, it is rather odd to find a great vessel of some six thousand tons weight riding with a single anchor off a dangerous coast in a notoriously bad anchorage, and with "wild weather" about. There had been a tempestuous gale, and everything seemed to show that the tempest had only lulled, not subsided. The wind was still squally and blowing with great force, and there was a heavy sea on. Yet there was only a single anchor to hold this huge monster of iron. This scarcely looks like ordinary prudence. There is another circumstance which must not be overlooked. Lord Clarence Paget some months since asserted that the orders which the Admiralty had issued to commanders of vessels to economize in the use of coal had produced dangerous results; that officers, afraid of being rebuked for extravagance in coal, dispensed with steam as much as possible, even to the peril of their ships; and that many so-called accidents might be traced to this cause. In the present instance we find that the fleet, in boisterous weather and in a dangerous situation, had their fires banked up in obedience to orders from the flag-ship. When a fire is banked up, it takes on an average nearly an hour to get up steam; but by a great effort the engineer of the *Northumberland* was able to get up steam in twenty minutes. Even this, however, was too late to avert the accident. The *Northumberland* had five hundred yards to drift before she struck the *Hercules*, and if she had at once had the command of steam, she would probably have been able to control her motions, and keep clear of her consort's stem. It is evident that this accident is destined to land us in another fierce controversy as to the proper model of ships of war. We shall have the battle of the ships fought over again, and the moderate-sized, swift, easily-handled vessel pitted once more against the unwieldly but, when once engaged, overwhelmingly powerful leviathan. It can hardly be doubted that for the present we have gone at least far enough in the latter direction, and we may now reasonably pause to take stock of our position. It would also seem that our commanders do not find themselves at home in the handling of these huge ships. Seamanship is in a transition state between old and new, and old habits and traditions have as yet been only partially adapted to new exigencies and responsibilities.

NEWSPAPER DECENCY.

PUBLIC decency has, it seems to us, rather a serious quarrel with the conductors of more than one of the morning journals for the manner in which they have treated the Emperor's death as a matter of news. The Emperor died of an acute and painful malady which there can be no harm in naming in plain English, but which it was surely enough to name without seeking to gratify the prurient curiosity of a section of the public by going into minute medical details of the most disgusting and sickening character. All that the public required to know was the general course of the malady; how the Emperor bore the successive operations, the nature of which everybody understood perfectly well without specific description; whether he kept up his strength; whether the doctors were hopeful, and everything going on well; or whether the patient's condition had taken an unfavourable turn. All this might have been told without any violation of decency or decorum. The medical bulletins which were issued by the physicians told really all that it was necessary or proper to publish for the information of the world at large. The physicians perfectly understood the line to be drawn between professional confidences and public news, and it is a pity the newspapers did not content themselves with this authentic and discreet intelligence. The immediate cause of death, whether apoplectic seizure or stoppage of circulation, has yet to be made known, but only a morbid and nasty curiosity would seek to intrude into more minute and private details.

Unfortunately several of the morning journals have thought differently. These are days of close newspaper competition and eager enterprise, and all is fish that comes to their nets. An Emperor's disease, no matter what it is, is an article of commerce like anything else, and must be made the most of. And so the dead man's miseries, and all the dark and horrible secrets of human suffering, are hawked about the streets like costermongers' wares. "Special Report—His Latest "Moments!" bawls the *Standard*; "Special Medical Details!" pipes the *Daily News*. The *Standard*, to do it justice, lets alone the medical part of the story. But it draws aside the curtain from a family sorrow which the commonest instincts of humanity should have taught it to respect. And the same may be said of the *Daily Telegraph*, which thrusts us into the chamber of death, and makes a show of the stricken widow and her boy. The *Times* reproduces in a modified form, and with judicious excisions, the detailed medical record which is published by the *Lancet*. The *Daily News* and *Post* reprint the medical report without even the softening of a word; they shrink from nothing. It is of course natural and necessary in the interests of science that professional journals should publish information of this kind. They do not appeal to the general public, and the professional men who read them are not gratifying a morbid and impertinent curiosity in studying the minutest particulars of disease. Whether the medical journals should be in such violent haste to print their secrets is another question. Science would hardly suffer even if the disclosures were postponed until the subject of them had been committed to the tomb. For the publication of such articles in a journal intended for general, and especially for family, circulation no excuse can be alleged. It cannot be pretended that it is done in the interests of science, for the multitude is

not scientific. It is impossible to doubt that prominence and publicity are given to these painful and disgusting details purely for the sake of pandering to a prurient and vicious curiosity. Unfortunately there are people who like to pry into horrible things, and to gloat over the awful secrets of disease and death. For our own part, we do not believe that journals which deliberately set themselves to foster and gratify these vile and morbid appetites are really serving their own personal interests. They disgust and sicken more people than they please. Good feeling as well as good taste is outraged by this loud and shameless traffic in the sad mysteries of the sick-room, the agonies of the dying, and the fresh overwhelming sorrow of the bereaved family, the widow's sorrow, and the orphan's tears. There is something inexpressibly revolting in this prying and peeping into a sacred scene, this twitching of the ghouls at the coverlet of the sick-bed, and this hasty public autopsy in the streets the instant the dead man has ceased to breathe.

The subject is a very painful one, and it cannot be necessary to enlarge on the offence which has been committed by several journals more eager to sell their sheets than to show respect to public decency or to their own character. We have heard only one opinion on the subject, and it has been very strongly expressed. The publication of these too curious and private details is a violation, not only of social decorum, but of the sacredness of domestic privacy. Of late there have been too many indications of a disposition on the part of certain newspapers to pass beyond the limits of legitimate and decent news, and this tendency has now apparently reached its climax. We can only hope that the general disgust and indignation which must have been produced by the contents of some of yesterday's papers will help to work a cure.

OVERWORK.

EVERY one who has had much to do with schoolboys or undergraduates is aware of a pleasant fiction which is current amongst them, but which receives still more credit from their mothers and sisters. A young gentleman whose face is rather pale, whose hand shakes more than is fitting at his time of life, and who has a generally dilapidated appearance at the end of term, is apt to ascribe those symptoms to the superhuman efforts which he has made in passing the Littlego. He throws out dark hints about the necessity of fastening a wet towel round his head, and supporting his nervous system by copious draughts of green tea. His female relatives naturally sympathize, and regard examiners as stony-hearted inflicters of tortures upon the young. The more experienced and impartial observer is apt to be sceptical. It is indeed true that some young men have injured their constitutions, and probably more are likely to suffer the same injury, under the influence of competitive examinations. But it is also true that in a majority of cases the fiction is tolerably transparent to the young gentleman's college acquaintance. Overwork is sometimes a simple appeal for compassion; its supposed victim is merely acting the part of pallid student to impress the audience at home. More frequently it is a delicate periphrasis for other evils of a less presentable nature. Its sufferer may be imparting to intellectual exertion what is really due to a misguided passion for supper-parties and to nights spent in devotion to loo. In short, overwork is a highly convenient veil to throw over the innumerable methods in which a youth may injure his constitution. If the physical mischiefs produced by excessive study could be fairly compared with the mischiefs produced by other causes, we have a shrewd suspicion that their sum total would be infinitely less than is generally supposed. We may say pretty confidently, from a tolerably wide experience, that the number of victims to overwork is utterly insignificant compared with the number of victims from other causes, and with the number of cases in which the excuse is imposed upon soft-hearted relations.

What is true of undergraduates is at least equally true in later life. Most men, as they grow older, grow lazier, and at the same time become more accomplished hypocrites. For both reasons they acquire greater skill in imposing upon themselves and others. A young man brought up in happy ignorance of physiological laws, and placed under the stimulus of a competition whose importance he grossly exaggerates, does occasionally take liberties with his constitution. When he becomes conscious of his digestive apparatus, he grows more cautious, and is less accessible to excitement. He cannot be ridiculed by his companions, and he becomes an adept in the art of self-flattery. Everybody likes to think that he is making superhuman exertions, and his wife and family accept his theories much more readily than his tutors and competitors. And thus, when some eminent man breaks down under the strain of his labours, there is immediately a chorus of hard-working people who are ready to exclaim Yes, we are all breaking down. The cry is taken up by the newspapers, and we are treated to eloquent sermons upon the terrible excitement and the incessant wear and tear of modern life. We are living too fast, burning the candle at both ends, and exhausting our nervous systems under the incessant pressure of our struggle for existence. How much of all this is genuine? and how much is merely the repetition in later life, and with greater affectation of solemnity, of the old undergraduate pretence that we are being over worked, when in reality we are only wanting to excite a little domestic pity?

That a great deal of this lamentation is mere pretence will probably be acknowledged by any one who fairly examines the cases of his acquaintance. A gentleman has a comfortable breakfast; he goes to his chambers or his office, and returns to a late dinner. He does no work afterwards, and has plenty of time for a good sleep. His whole time for active work is comprised, say, between 10 A.M. and 6 P.M. From that must be deducted the time spent in luncheon, in gossiping, in the intervals between different pieces of business, and in all other interruptions. If he has been actually employed upon any serious intellectual labour for six or seven hours in the day, he has probably done as much as most men; and of this again a very large part is in most cases of a purely routine character. If a man who keeps himself up to this standard does not get from six weeks' to two months' holiday in the year, he considers himself to be cruelly injured, and immediately complains that he is being worked to death. One hears such complaints from many men who, if surprised in the hours of what they call business, are as often as not reading the newspaper, or perhaps making believe to read it. An energetic man will frequently contrive to cram into the hours which are allowed to run to waste by his friends work enough to win literary or scientific reputation as a voluntary addition to his other labours. As very few men have the necessary taste for such supererogatory performances, we may fairly assume that their burden is not heavier than human nature may fairly be expected to bear. It is of course true that there are many exceptions to this rule. There are barristers in large practice who have to begin the study of their briefs at five in the morning; physicians who cannot call any hour of the day or night their own; and Ministers whose labours, sufficiently severe in themselves, are only suspended whilst they breathe the unhealthy air of the House of Commons. But such cases, though positively numerous, are relatively a very small minority. Few members of Parliament are unable to spare time for society, for sport, for travelling, or for a thousand other modes of time-killing. The vast majority of professional men are far more apt to complain of the absence of work than of its excessive supply. For one barrister whose table is groaning under an accumulation of briefs, there are a hundred whose absence from chambers, though a subject of regret to their friends, would be accepted with surpassing equanimity by attorneys and by the public at large. The overwork of which we complain, so far as it really exists, is the result of a social system which accumulates duties upon a few, to leave the mass at complete leisure. Of the few, again, it must be added that a majority have no heavier burdens than they can fairly carry. The longevity of successful lawyers is notorious. We need not give instances of the many successful men who have been hard at work from early manhood to old age; of whom the chief complaint is that their appetite for work survives their capacity for doing it satisfactorily. With such men it must be supposed that hard work has been rather healthy than otherwise; and thus the actual sufferers are reduced to the minority of a minority. They are the few men whose intellectual force is disproportioned to their physical strength, and who have not self-restraint enough to decline duties for which they are fitted in every respect but constitutional power. Some such men doubtless break down every now and then, and the sympathy which their cases excite provokes others to exhibit themselves in the same amiable character. We all like to be martyrs, especially when the fire exists only in imagination.

The complaint of overwork, when it has some genuine foundation, is generally founded upon a misconception. There is undoubtedly a very real and not uncommon evil which is described under the name. Two men of equal strength may be doing the same amount of actual work, and yet one may be killing himself, whilst the other finds his duties mere child's play. The reason is, of course, that one man's work is productive of anxiety, whilst the other's may be merely soothing. A speculator may spend a very few hours in anything that can be called business, but the difficulty is that he cannot leave his business behind him. Anxiety about money is the most deadly of all troubles. When a man commits suicide, it is far less reasonable, according to the old proverb, to ask, Who is she? than to ask, How much is it? Business which keeps a man in a state of constant oscillation between ruin and a fortune, which follows him home and prevents him from sleeping, is incomparably more trying than almost any quantity of downright steady work. The Stock Exchange at New York must fill lunatic asylums more quickly than all the most laborious Universities in Germany, England, and America. A professor may labour at the collation of manuscripts, or even at the search for the Absolute, for fifteen hours a day, and be all the better for it; a third of the time spent in studying the ups and downs of Erie Railroad shares, and staking money on the result, would qualify him for a strait-waistcoat or a halter in a year. As, however, speculation has a comparatively discreditable sound, the evils which it produces are very frequently placed to the account of its more respectable rival, straightforward industry. We choose, in one form or another, to spend a great part of our time at the gaming-tables which exist in an infinite variety of forms in every capital in the world, and then complacently com-

plain that we have injured ourselves by over application to our duties.

As a rule, therefore, we should say that the complaints of overwork are amongst the most flimsy of all the excuses set up by men for the evils which they bring upon themselves. Very few people really work hard; and when they do, it generally agrees with them. Directly or indirectly, idleness does fifty times as much mischief, for the best cure for the love of excitement is steady application. A vast amount of good pity is thrown away in the world; and, instead of solemnly warning our friends not to do too much, we should find it simpler to refuse the indirect compliment for which they are manœuvring, and advise them to relax their minds by a little strenuous activity. When the danger really exists it may generally be remedied rather by redistributing the burden than by diminishing it. A very slight physical exertion may injure a man for life, if only he undertakes it in the wrong way. Try to lift a thousand pounds weight by a sudden jerk, and you may probably break a bloodvessel. Divide the weight into ten portions, and lift each calmly by itself, and the exercise may do you good. Run a mile after a hearty meal, and you may be injured for life; walk ten miles a day, and you may materially improve your health. The same principle is applicable to intellectual labour. To lay down any general rules is impossible, because constitutions vary infinitely. One man requires twice as much sleep as another; one man can do work before breakfast when another finds it answer better to sit up at night, and so on. A few practical rules will be learnt by practice. The *Lancet*, for example, in a sensible paper on the subject, remarks upon the importance for men who work at night of having a white, powerful, and steady light concentrated upon their papers; flickering and diffused light being one of the most serious causes of brain irritation. Good food, with a moderate supply of stimulants, and a final pipe before turning into bed, is a comfortable recommendation of the same authority; whilst, of course, excess in tobacco and alcohol is a constant cause of the incapacity for sleep which is often complacently attributed to overwork. The rule is, in short, that a man should take care that he gets good sleep and keeps his digestion in order. A little unprejudiced observation of his own symptoms will teach a man of ordinary sense how to keep himself in health; and, by a judicious arrangement of his time and habits, he will find that he can do as much work with perfect impunity as will serve him, if he so pleases, with an admirable excuse for committing suicide and becoming a text for leading articles. It is not overwork that should be denounced, but the bad habits for which work is made to serve as an excuse. Eat too much, drink too much, smoke too much, and do everything in a hurry and at the wrong time, and five hours a day may send you to an early grave. Show a little common sense, and without injuring your health you may be as voluminous an author as Voltaire, or do as much legal or official work as the most industrious Minister or barrister of the day, and see your children's children, and laugh at the degeneracy of the rising generation in the twentieth century.

DEAN STANLEY AT THE WORKING-MEN'S COLLEGE.

ON Monday evening last Dean Stanley delivered the inaugural lecture of the present session of the Working-Men's College in Great Ormond Street. In common with the Chairman he naturally referred to the loss which the College had sustained in the death of its founder and late Principal, Professor Maurice, since the last annual meeting; but on that subject we need not add anything here to the remarks we made at the time of Mr. Maurice's death. On Mr. Maurice's merits as a theologian and philosopher opinions do and must differ widely; but it would be difficult to point to any writer who has been constantly before the public through a long life, taking an active part in all the religious controversies of an exceptionally controversial period, who has left so few enemies behind him, and so large a band of warm admirers, if not exactly of disciples. At the Working-Men's College especially his name will ever be cherished with gratitude and respect. Our immediate concern, however, is with Dean Stanley, whose address, if it has been correctly reported, is a curious, not to say amusing, illustration at once of his characteristic versatility and his characteristic defects. A good deal has been said of late about the Dean's indefiniteness of religious belief. But this vagueness is a peculiarity not of his creed simply, but of his intellectual constitution altogether. He has an instinctive aversion to definite statements on abstract subjects, not because they are false, but because they are definite; and this abundantly accounts for his dislike of all dogma. It would probably be very unfair to credit Dean Stanley with any greater predilection for the heresies anathematized by the Athanasian Creed than for the orthodoxy which it is intended to enshrine. But a sharp dogmatic assertion, whether Arian or Trinitarian, he cannot away with. What he would have done in the age of the early Councils, or how he would have fared in the "ages of faith," is an idle, if not a painful, speculation. It is almost as difficult to conceive his being burnt for a specific heresy as his composing a creed. But there is a story, which may perhaps be considered unpleasantly suggestive, of a man being executed by the Turks at Constantinople, not for his misbelief—for that would have been tolerated—but because he could not make up his mind, or at least could not manage to explain with the requisite distinctness, whether he was a Christian or a Mahometan. The Dean of Westminster might have reduced the Inquisitors to a similar dilemma, let us hope with a less tragical result. But we are not going to usurp the functions of the approaching Session of Convocation by discussing the Dean's theology, which only concerns us here so far as it illustrates the general tendency of his mind. The subject which he selected for the edification of the working-men was one to which we have before now ourselves called attention, and which is unquestionably of great interest both in a speculative and a practical sense. When he began with observing that there was a general complaint at the present day that the age of individual influence had passed away, and that henceforth the world would be guided exclusively by general movements, or laws, or forces, or masses, or parties, he was in fact taking up the warning note uttered half a century ago by Coleridge, about what he called "plebified opinion," and more emphatically repeated in our own day by Mr. Mill in his essay on Liberty. We are quite disposed to believe that the danger is a real one, though it may have been exaggerated, and that there is much in the existing conditions of social and political life to force it prominently on the notice of thinkers as well as of statesmen. It is also true, no doubt, that there are considerations, more or less weighty, to be urged on the other side. But it is not equally clear that the Dean has been successful in suggesting them. In many ways it is sure to be the case that "the individual withers" as "the world is more and more." There is less room for originality of thought and independence of action in a highly civilized stage of society. Agamemnon indeed is no longer without his sacred bard, but there are so many Agamemnons, and so many bards, that the praise becomes cheap, and the heroism ceases to be remarkable. Even had Mr. Gladstone been able, as he tells us he is not, to snatch half an hour every morning before breakfast for the study of Homer, we may safely assume that the great charm of the study would have lain in the contrast, not the analogy, of the heroic age of Greece to the prosaic age of England. To all this, and much more that occurs to one on the same side of the question, some reply, we repeat, may be made. But what is the Dean's reply?

In the first place, he referred, naturally and gracefully enough under the circumstances, to Mr. Maurice's foundation of the Working-Men's College in Great Ormond Street—a very excellent work, no doubt, but one which, beyond the limits of Great Ormond Street, might hardly be accepted as an adequate proof of "the great importance of the influence which individuals might still exercise over the fortunes of the world." And then, dashing back with the rapid intuition of genius from the nineteenth century to the second, he pointed to the bust of Marcus Aurelius before him, "one of the best and greatest of Roman Emperors," who had learnt from his grandmother to control his temper, from his father modesty and manliness, from his mother to abstain from evil thoughts, from Apollonius freedom and strength of will, and from Alexander the Grammarian to form a charitable judgment of his neighbours. Now, even if the influence of Marcus Aurelius had been all that is here implied, we do not quite understand what it would prove about the scope for individual influence in the present age, unless the speaker meant, what he does not appear to have said, and what is only true with considerable qualifications, that the civilization of our own day had reproduced the social conditions of the later Empire. But even waiving this preliminary difficulty, it is not easy to catch the point of the argument. The Emperor may have been a model in his private life of all the virtues he had learnt from his various relations and tutors; but as far as his influence on the world is concerned, his virtues counted for less than nothing. He was wholly powerless to raise or purify the tone of that Pagan society of which he was the head, and his name is chiefly remembered in history as the author of one of the fiercest and most systematic persecutions of the Christians, who were again exposed under his government to all the denunciations of common informers, bribed to delate them by the promise of a share in their confiscated property. As Milman puts it, "The most distinguished Christians of the East were sacrificed to the base passions of the meanest of mankind by the Emperor, who, with every moral qualification to appreciate the new religion, closed his ears, either in the stern apathy of Stoic philosophy, or the more engrossing terrors of Heathen bigotry." And the power which he did in this way exercise—not altogether perhaps to the benefit of mankind—was due solely to his official position. As the author of the *Meditations*, he influenced his contemporaries not at all; but he was able to persecute the Christians as Emperor of Rome. In the former capacity he may have been "truly great," in the latter his influence was unquestionably "transitory and fugitive." If this is what Dean Stanley meant by bidding the "students to learn to distinguish between those men who are truly great and those who are transitory and fugitive," we can but say that so elementary a lesson might have been conveyed in a less circuitous manner. We may pass over a rather obscure passage about a single man being able to save a city now as well as in Macaulay's *Lays of Ancient Rome*, with the obvious remark that such abnormal emergencies as the siege and the Commune of Paris must always give exceptional scope to individual energy and resource, and prove nothing as to the part played by individuals in the general economy of the world. But the next passage is so eminently characteristic of the speaker in more ways than one, that we may be pardoned for making a somewhat longer extract. In attempting to estimate the relative importance of individuals and laws or masses in the general development of the world, one

of the last things that would have occurred to an ordinary lecturer as a discussion of the Darwinian theory of the origin of man. But the Dean of Westminster is not an ordinary lecturer, and he proceeds as follows:—

> It was often said on all sides that the whole system of our belief, duty, and hope of immortality, was being undermined by certain speculations and investigations that had been set on foot with regard to our ancestors in the most remote myriads of ages. It was said that our faith and duty towards each other and God were undermined, supposing it should be proved that the first beginning of man was something lower than we had been in the habit of supposing. He would not pronounce an opinion either way; but he wished to urge that a great deal too much importance had been attached to these speculations. The only thing really important for us practically was what we were as individuals at the present time. It was nothing to us whether our remote ancestors were in those dark ages formed out of the mere inanimate dust of the earth, or whether we translated "the dust of the earth" into modern scientific language. The fact we had to remember was, that we were living individuals with enormous faculties bestowed upon us, and that on our use of them our destiny in this world and the next would be shaped for good or evil.

In criticizing a passage of this sort one is sorely puzzled to know at which end to begin. In the first place, it has of course absolutely nothing whatever to do with the professed subject of the lecture. No one—Darwinian or anti-Darwinian—ever dreamed that the relative action of personal and corporate or other influences in the world in a particular age depended, one way or the other, on our alleged genesis from a mollusc or a baboon. That many religious people have been seriously perplexed, reasonably or unreasonably, by these "investigations and speculations" is true enough; but we are afraid the Dean's exhortations will not do much to console them. They will readily admit that our sense of our own individuality and our immediate capacities of action are not directly affected by such theories; but they will argue that their most cherished religious convictions about, say, the inspiration of the Old Testament or the doctrine of original sin, are very materially affected, and that with these convictions their energies and motives of action—or, to adopt the stereotyped formula, "their happiness here and hereafter"—are intimately bound up. The Dean may consider such perplexities exceedingly childish; but they are at least equally justified in considering his solution of their perplexities irrelevant. Even Mr. Froude, who makes very merry with "the ablest living natural philosophers looking gravely to the courtship of moths and butterflies to solve the problem of the origin of man," and professes entire indifference as to the descent of our mortal bodies from "some glutinous organism on the rocks of the primæval ocean," insists passionately on regarding his "intellectual spirit" as "engendered from another source," which it is by no means clear that a consistent Darwinian would allow. And Mr. Froude is probably less sensitive than most people about theological difficulties. Dean Stanley simply ignores them. He is, we doubt not, honestly incapable of conceiving how it can matter to any rational being whether man was originally "formed from the dust of the earth," according to the old belief, or gradually attained to the full proportions of humanity through a long ascending scale of jelly-fish and baboons. Yet psychology as well as theology is a good deal interested in the problem which he dismisses so airily as a mere question between two different forms of language. Here, however, as in the famous "dispute about an iota," the forms of speech for which "graceless zealots" are contending will appear to many minds identical with "forms of faith," and we fear the Darwinian controversy will be as little set at rest as the Arian by the bland assurance that, after all, it makes no difference. We will not attempt to follow the Dean through the second portion of his lecture, in which he argued that "institutions," like individuals, have still a commanding influence to exert in the world; the more so as, in this case, so far as the reporter has enlightened us, the Working-Man's College in Great Ormond Street was not only the first, but the solitary, illustration of his argument. We sincerely hope it may be true that our ancient institutions in Church and State "still retain their vitality"; but the success of a very modern institution, on a considerably smaller scale, does not supply all the evidence to that effect which we could have desired.

THE GREAT-CORAM-STREET MURDER.

WE cannot help thinking that the passion for notoriety which is one of the prevalent disorders of modern society is exercising an extremely unfavourable influence on some at least of the processes of criminal justice. Whenever a crime is committed, the great object of everybody concerned in the investigation which follows would seem to be to turn it to account as a sort of platform on which they can strut up and down, and exhibit themselves to the admiring gaze of their fellow-creatures. One day they are only common people like the rest of us. They go to and fro, and nobody notices them. But in the night an unknown person happens to murder somebody, and all at once a host of obscure and insignificant people suddenly find themselves famous, not through anything they have done, but only through the accident of being mixed up with a criminal investigation. The police, the witnesses, the coroner, the coroner's jury, and the coroner's man instantly become objects of interest. They feel that the eyes of the world are upon them. Their names are in all the newspapers, and they have even a chance of being photographed. The public-house in which the inquest is held is no longer as other public-houses; a halo of reflected interest is shed upon its frowsy bar and dingy taproom, and its "drawings" are quadrupled. It is well known that in a democratic community there is nothing so much detested as equality, and men are disposed to be thankful for anything that marks them off from the common ruck of undistinguishable humanity. To be known as the man who was fast asleep all night while a murder was being accomplished in the next room, or as the policeman on duty outside the house who did not catch the murderer, is, after all, better than not being known at all. To be mentioned in a descriptive article in the *Daily Telegraph* is with some people an object of ambition. We once knew a country fellow who carried his head very high because his second cousin had been eaten by dogs. The police who are concerned in these inquiries have more substantial reasons for keeping themselves as much as possible before the public. Advertising pays in their profession as in others; and the heroes who are glorified by penny-a-liners as "active and intelligent" find ample scope at any rate for their activity—we should be sorry to say too much of their intelligence—in protracted inquiries which are sure to be fully reported in the morning papers, and which will perhaps be made the subject of some gay descriptive writing. If a murder is committed, and the murderer cannot be discovered, it is all the more necessary for the credit of the force that the police should seem to be particularly busy and energetic. It would almost appear as if the investigation of a murder before the coroner or police magistrate was now regarded as a sort of popular amusement—something akin to the sports of ancient Rome—which should be made as lively and attractive as possible. It is difficult to account in any other way for the manner in which these inquiries are spun out, with adjournment after adjournment, and fresh batches of witnesses, and all kinds of irrelevant and superfluous evidence. A few months ago a couple of semi-idiotic German lads wound up a drinking bout in a brothel by shooting each other, and one of them died. From the first there was not the slightest doubt that they had fired at each other by agreement, and that nobody else was in any way concerned in the affair. But the police thought it necessary to extend the inquiry so as to embrace not only the personal history of the wretched women connected with the house, but generally the manners and customs of fast life in London in its lowest aspects. Just now there is another inquiry going on with reference to the murder of a woman on Christmas eve. She, too, was of the class called unfortunate, and again we are treated to a minute inquiry into the manners and customs of her class, and all sorts of unsavoury matters having nothing on earth to do with the case are eagerly opened up. It is only fair, however, to say that for this the Coroner seems to be more to blame than the police.

We need not repeat the details of the Great-Coram-Street murder, which must be familiar to all who take an interest in such things. A poor woman was found in bed on Christmas morning with her throat cut. She had been killed apparently in her sleep. It was clearly a case, not of suicide, but of murder, and the only question is, who was the murderer? Suspicion has fallen on a man who is said to have come home with the woman late at night, but who had disappeared before morning. This is the story of the landlady and of some of the lodgers. The landlady did not see him, indeed nobody saw him, but she says she heard him come in, and she thinks she heard him go out in the middle of the night. The woman, she says, told her he was in the house, and also made a similar statement to one of the lodgers. It was necessary for the police to trace the woman's movements on the night before the murder, and also to ascertain what sort of people lived in the house. Everybody who in a moment of idle curiosity has lifted up a flat stone that has been lying in a field knows what a scamper there is of odd and rather nasty insects, running hither and thither, in a dazed, bewildered way. The lifting off of the roof of the house in Great Coram Street produces a somewhat similar impression. It may be doubted whether even the dignity of being witnesses in a murder case has altogether repaid the inmates for the unpleasant shock of the sudden illumination to which they have been subjected. It was necessary, as we have said, for the police to make themselves acquainted with all that passed in the house on the night of the murder, and to inquire into the character and antecedents of the lodgers; but it was obviously unnecessary to call any of the inmates as witnesses unless they could throw some light on the circumstances of the crime. The murder was committed on Christmas Eve, and the inquest was opened two days later. The Coroner has had three sittings, and has again adjourned the inquiry, and there is no saying when it will be ended. He remarked at the last sitting that as "this was the only court open to receive evidence and investigate testimony, it would be better in the interest of justice that it should be kept open than that the inquiry should be closed." We should have thought that it was the duty of the police to receive evidence and investigate testimony with a view to the discovery of a murderer; and if the Coroner means that testimony cannot be efficiently investigated for such a purpose except in a Coroner's court, we venture to differ with him entirely. Whatever may be the effect on the interests of justice, the dignity of justice will certainly not be promoted by the sort of proceedings which have taken place before the Coroner in this case. He seems to have started with a conviction that the great object of the inquiry was to clear up some doubts which had been raised as to the respectability of the house in

Great Coram Street. The landlady says the deceased woman told her that she had brought home a male companion, and paid over nine shillings out of ten which he had given her. Anybody but Dr. Lankester would have been satisfied with this admission, which indicated plainly enough the character of the landlady and her relations with the deceased. But Dr. Lankester thought it necessary to press the landlady very much on this point. Would she have taken the money if she had reflected on the manner in which it had been obtained? "That is the point," he said, "and it is about that that the public are indignant." If, he added sagaciously, she had refused to take the money, and had turned the man out of the house, the murder would not have been committed. "Crowner's law" would perhaps make this constructive murder, and it is difficult to see what other bearing this examination had on the inquiry. The jury at first seem to have agreed with the Coroner that all doubts as to Mrs. Wright's moral character and the character of her lodgers must be fully cleared up, and went with great zest into the question whether, with regard to another pair of lodgers, the lady lived with the gentleman or the gentleman with the lady. It was admitted that they were not married, but "they were going to be." The important fact was ascertained that the landlady had seven children, four out at nurse. The inquiry had now got into such a condition that the solicitor who attended to watch the case for the landlady thought it would be a good opportunity to cross-examine a Spanish gentleman who had lodged in the house, but who had left on account of the murder, whether he would not be disposed to come back to Mrs. Wright if she took another house. The jury seem to have felt that this was rather an impertinence, and tried to stop the examination. The Spanish gentleman admitted that Mrs. Wright's knowledge of Spanish cookery weighed greatly in her favour, but he had had "quite enough," and declined to go back. This witness was recalled at a subsequent sitting, and was asked some more questions about the character of the house and its inmates. He pleaded that, "being a foreigner, he was not likely to see suspicious things for himself," and urged that one of the jurymen, whom he recognized as living over the way, should have known from his own observation what sort of an establishment it was. The Coroner also sent for Mr. Wright, the landlady's husband, and read to him some anonymous letters which had been received reflecting on the character of the household. Mr. Wright could only say that, as a rule, he never took notice of what went on in the house, but he was sure none of the lodgers murdered the woman; "they were too respectable for that." Mr. Wright perhaps forgot about Mr. Thurtell and his gig.

It is an old question whether a Coroner should be a doctor or a lawyer. There is no doubt a good deal to be said in favour of a coroner having some medical knowledge; but it is perhaps even more desirable that he should have at least enough law to enable him to understand the elementary rules of evidence, and to keep the inquiry over which he presides strictly to the questions at issue. In this case the police have not discovered the murderer, or any trace of him; but they have discovered, what it was very easy to find out, how a woman of the character of the deceased, who regularly frequented certain notorious places, spent her evenings. The Coroner was amazed that a French waiter, who had seen a stranger in the company of the woman, but had not heard him speak a single word, should not be able to say what was his nationality. "A Frenchman," he observed, "generally seemed to scent out a German." The Coroner perhaps shares the impression of some of his countrymen, that foreigners all belong to very much the same family, and speak the same language, with slight variations. When one of the barmaids at the Alhambra was called, the Coroner, who had already pressed the French waiter as to whether he expected sixpence for helping on an overcoat, seized the opportunity of inquiring whether they gave good "four-pennorth's" of whisky at the Alhambra; but it appears that sixpenny glasses only are supplied. It is difficult to imagine anything more calculated to bring judicial proceedings into contempt than an inquiry conducted in this loose, wandering, and utterly undignified fashion. One half of the world, it has been said, does not know how the other half lives, and there are perhaps some people who find these peeps into the shy corners of life very interesting and amusing. If the Coroner were presiding over a popular entertainment, his little jokes and droll digressions might perhaps be suitable. A stranger might certainly have been present during a considerable part of this inquiry without discovering that it was a solemn judicial investigation into the circumstances of a peculiarly horrible murder. It is of course necessary for the police to collect all the information they can get bearing on the case, but we should have thought that it was their business to sift and test it privately, and to bring into court only such witnesses as were likely to be able to assist the jury by their evidence. The foreman of the jury has stated that they have not the least doubt, and of course nobody can have any doubt, that a brutal murder has been committed; and to all appearance this is all that will ever be known. Unreasonable expectations are often entertained as to what the police can do for us in the detection of crime. They have not the same facilities for following up their inquiries as the police of some foreign countries, and in the present instance the chances are all against their picking up a clue which has been missed at the outset. It would not necessarily be discreditable to the police if they failed to discover the criminal in this case; but it may be doubted whether they would not be more likely to be successful if they were content to work silently and quietly, instead of wasting their strength in getting up a show of useless evidence and trying to make a figure in court. It is not creditable to the intelligence or carefulness of the police that their French advertisement should, by a misunderstanding of French measurements, describe the supposed murderer as 6 feet 3½ inches in height, while the English advertisement makes him 5 feet 9 inches.

THE *PALL MALL GAZETTE* ON HISTORICAL CRITICISM.

THE justice of the *Pall Mall Gazette* may be sure, but it is certainly slow. It follows the offence at much the same pace as the prosecution of Eugene Aram. We sinned on February 5, 1870; we are called up for judgment on January 7, 1873. We are charged with having represented Mr. Froude as having made a mistake which in truth he has not made. To this indictment, in the literal and grammatical sense of the words, we may as well say at once that we plead guilty. But we think that we may at least plead extenuating circumstances. We think that any one who goes through the whole story will find that there is, on the whole, more to be said on our side than there is even on the side of Mr. Froude, still more than there is on the side of the *Pall Mall Gazette*.

When three years ago we were reviewing the last two volumes of Mr. Froude's History in a series of articles *, we spoke of the constant inaccuracy of Mr. Froude's way of using his authorities; of his custom, for instance, of putting words within inverted commas which are not the actual words of the passages referred to. We said that the way in which Mr. Froude treats the ordinary books which we have at hand made us feel very doubtful as to the many cases in which Mr. Froude's statements rest on the authority of manuscripts at Simancas or elsewhere, which we have no means of referring to. This, in the language of the *Pall Mall Gazette*, is "one of the coarsest" of our "charges against Mr. Froude," and our "customary insinuation that the evidence on which Mr. Froude founds his conclusions is garbled and falsified." This is of course the *Pall Mall Gazette's* way of putting it. Every one who will take the trouble to look back to our articles will see that we have never charged—we are not in the habit of insinuating—Mr. Froude with garbling or falsifying anything. Garbling and falsifying are words which imply wilful perversion of the truth, and of this we have never suspected Mr. Froude; indeed we do not even now suspect the writer in the *Pall Mall Gazette*. We believe that garbling and falsification are processes which are pretty well unknown among writers of anything like Mr. Froude's position. We believe that Mr. Froude is, in a certain sense, careless about truth—that is, that he does not take the same pains which a writer like Bishop Thirlwall, for instance, would take to find out the truth. We believe that his mind is inherently inaccurate, but of wilful perversion of truth we never accused him, never suspected him. We believe that a great many people, and seemingly the *Pall Mall* writer among them, cannot make this distinction: they cannot see the difference between a charge of culpable carelessness and a charge of wilful falsehood. Hence, it may be, comes what, if we used the language of the *Pall Mall Gazette*, we might call its "coarse insinuation" against ourselves.

In reading Mr. Froude's twelfth volume more than three years ago, we were struck by the singular name of the ship in which the English Admiral sailed at the time of the engagement with the Armada. Mr. Froude called it the *Ark Raleigh*. The name sounded odd; Mr. Froude quoted no authority; he gave us no kind of hint where the name was to be found. But when we looked in Camden's *Annales* we found that the same ship was there called *Arcka Regia*. The inference was that, strange as the mistake might be, Mr. Froude had made a mistake. Now, if the *Pall Mall Gazette* will let us draw the distinction, there are many writers with whom we should not have made any such inference. If we had found anything of the kind in Bishop Thirlwall, or Dr. Merivale, or Sir Francis Palgrave, we should never for a moment have thought that they were blundering. In the case of Bishop Thirlwall or Dr. Merivale indeed the case could not have happened, because most certainly either of them would have quoted their authorities. With Sir Francis Palgrave it might have happened; he, as all his readers know, does not deign to give any references; but his readers also know that, however queer any statement of his may seem, the authority for it is sure sooner or later to turn up somewhere or other. But this is because Bishop Thirlwall and Dr. Merivale are thoroughly accurate writers; because Sir Francis Palgrave also was accurate after a fashion—that is, because he never stated anything without something which he looked on as authority for it, however much others might doubt as to its really proving his point. In Mr. Froude we put no such confidence: for he is not, like the three great writers we have spoken of, habitually accurate, but habitually inaccurate. Mr. Froude has shown that he cannot make out the difference between the Bishoprics of Gloucester and of Worcester, that he does not know what is meant by a Prince of the Empire, that he does not understand such common terms of English law as impeachment, attainder, and *peine forte et dure*.

* See *Saturday Review*, January 22, January 29, February 5, February 12, 1870.

When therefore we found him calling a ship by one name and Camden calling it by another, our natural inference was that Camden was right and that Mr. Froude was wrong. Oddly enough, it turns out that Mr. Froude was right; therefore we suppose that Camden was wrong. But Mr. Froude's champion was certainly very long in finding this out. From February 1870 to November 1872 neither Mr. Froude nor the *Pall Mall Gazette*, nor, as far as we know, any one else, stood forward to point out our mistake. In November 1872 came that wonderful confession in which Mr. Froude describes himself as writing history for the same reason for which the stars above, in the song, are said to shine—namely, because they have nothing else to do. In speaking of that confession we incidentally referred to the old story of *Ark Raleigh* and *Arcka Regia*. Still there was no sign, none at least from the *Pall Mall Gazette*. But in December 1872 there came out a volume of *Calendars of State Papers* which we could hardly have made use of in February 1870, or even in November 1872, but from which it certainly appears that the Admiral's flagship was called the *Ark Raleigh*. Now therefore in January 1873 we are brought to trial for our offence which was now three years old. The writer in the *Pall Mall Gazette* had lighted on the passage in the new volume, and, having done this, he looked a little further into other documents, and fully established the fact that the flagship was called the *Ark Raleigh*, because, as it would seem, it had once belonged to Sir Walter. Mr. Froude therefore is right. Camden may be wrong, or he may be right also; for, as the writer of the *Pall Mall Gazette* suggests, the ship may have borne two names. For all this the *Pall Mall Gazette* calls us some very hard names, clothed in that grand, high-sounding Latin style which reminds us of nothing so much as a good scolding allocution of the Pope.

Mr. Froude then in this case was right; but does it follow that we were wrong? The *Pall Mall* writer says, in his grand way, "Mr. Froude, when he wanted specific information about the names and numbers of the English fleet at the time referred to, did not 'turn to his Camden.' He had other authorities much more trustworthy than the respectable author of the *Britannia*." And again, "Mr. Froude, not content with 'turning to Camden' in the easy-going fashion suggested by the *Saturday Review*, consulted original documents." This is graver still, one might almost think that the process of consulting original documents was one which Mr. Froude and the *Pall Mall Gazette* had wholly to themselves. The *Pall Mall* writer seems to want to make out two points—first, that our notions of research in a writer of history would be satisfied by the process of turning to Camden: secondly, that it was our duty, as periodical critics, to hunt into every corner for original documents before we ventured to open our mouths. In this, it strikes us, the *Pall Mall* writer confounds the duties of the historian and those of the periodical critic. We know not what the *Pall Mall* writer's experience may be, but those who know something about both businesses know that the two are widely different. When a man undertakes to write a history on the scale of Mr. Froude's, he ought to spare no time and no pains, not only in finding out the truth, but in making his readers independent of himself. He should not only give them his own views, but he should give them the means of forming different views if they choose. He should set before them the whole evidence. When his matter has to be found in manuscripts, or out-of-the-way printed books which few readers are likely to have at hand, he should give, not only the references, but the very words of his authorities. If his matter can only be got at by going to Simancas, to Simancas he must go. And when he comes back from Simancas he must, as far as possible, put his readers in the same position as if they had gone to Simancas themselves. No amount of labour, whether in the way of turning over books or of going to distant spots, will be thought too great if it can throw any light on the smallest fact of history. But the periodical critic can do nothing of this kind. He is bound by the laws of time and space; he must get his work done within a fixed time, often a very short time; and he must do it with such materials as he has at hand, or not at all. The easy-going fashion of turning to Camden is assuredly not enough for an historian of the reign of Elizabeth; it may easily be enough for the critic of Mr. Froude's twelfth volume. We feel sure that, if Lord Macaulay had written the history of the Spanish Armada, he would have told us all about the *Ark Raleigh*, why it was so called, and where the name was to be found. Mr. Froude takes his *Ark Raleigh* for granted without any reference or any kind of explanation. His critic does what he can at the moment—he looks to a respectable contemporary writer. He there finds a different statement from Mr. Froude's; he infers that Mr. Froude is wrong. It turns out afterwards that Mr. Froude is right; but we maintain that his critic is not to be blamed. If Mr. Froude had only given his reference, as an historian ought to do, no one could have mistaken him. If the general character of his history were such as to lead scholars to put that confidence in him which they do put in Thirlwall or Palgrave, no one would have suspected him. Mr. Froude hid his light under a bushel, and his critic had to judge by such light as he could get. Mr. Froude had cried wolf so often that he was not believed when the wolf was really there.

The *Pall Mall* writer begins his charge against us with a reference to the practice of the Court of Chancery; he tells us how the suitor must come into court with clean hands, and how he who charges another with inaccuracy must be scrupulously accurate himself. He adds that "very few are likely to turn to their Camden for verification." Mr. Froude, who frequently quotes Camden, is doubtless one of the few, but the *Pall Mall* writer himself clearly is not. We refer to the Latin text of the *Annales*. The *Pall Mall* writer goes to the English translation of the *Britannia*. The *Pall Mall* writer tells us, "As a matter of fact Camden does cite in his Latin text the name of the ship *Archa Regalis*." We must confess, to our shame, that this matter of fact is no matter of fact at all. In our article of February 1870 we gave the name of the ship correctly as *Archa Regia*. In returning incidentally to the matter in November 1872, by a slip either of the pen or of the press, we made it *Arca Regalis*; and this slip of ours, and not the genuine text of Camden, the *Pall Mall Gazette* is content to follow. As we are referred to the practice of the Court of Chancery, we may refer back again to the practice of some other branches of the administration of the law. It is quite possible that a magistrate may do his clear duty in committing a prisoner for trial, that the grand jury may do their clear duty in finding a true bill against him, and yet that the petty jury may no less do their clear duty in finding him not guilty. This analogy, we think, very well fits the present case. By the help of evidence which has been since brought to light, Mr. Froude has been shown to be fully entitled to an acquittal. But we hold that when at an earlier stage we had to speak of Mr. Froude by the light of such evidence as Mr. Froude himself chose to give us, we were fully justified in the true bill which we found against him.

A HORRID HOAX.

THAT remarkable journal the *New York Herald* has surpassed itself in the account which it gives in a late number of a series of practical jokes in which the well-known actor Mr. Sothern played a conspicuous part. We do not feel quite sure that the whole story is not a hoax upon the readers of the *Herald*, but we can at any rate enjoy the style in which it is told, without troubling ourselves to inquire too curiously into its truth. In order to begin at the beginning, the reporter tells us that Mr. Sothern is, in private life, a polished gentleman, of slight frame, with grey hair, and weighs about 105 lbs. He is 48 years of age. He has a powerful muscular development, and a merry laugh. Mr. Florence, who also plays a prominent part in the ensuing drama, is a smooth-faced gentleman of about 40 years of age, weighs 190 lbs., and generally wears lavender kid gloves. A young English gentleman, Mr. Philip Lee, the husband of one of the most distinguished and favourite English actresses that have yet visited America, was to be the victim of a "huge practical joke" concocted by Messrs. Sothern and Florence. He is a blonde Englishman with light hair, light yellow side whiskers, measures about 5 ft. 8 in. in height, and weighs 143 lbs. To do honour to Mr. Lee a dinner was given by Mr. Sothern at his rooms in the Gramercy Park Hotel, in New York. The dinner was sumptuous and well served. We will spare ourselves and our readers the enumeration of the dishes and wines. The rooms were gorgeously furnished with pictures, statues, and objects of *virtù*. The guests were all attired in evening dress and wore spotless white ties. All these particulars, and others which we omit, are given by the reporter as if they would be naturally expected by his readers in a narrative either of fact or fiction. Presently Mr. Jim Collier took from under his coat a paper battle-axe, such as is used to destroy tyrants on the stage. Mr. Niel Bryant drew a dirk knife, the blade of which, more than a foot long, he unclasped and placed solemnly by the side of his plate. Mr. Chris Connor produced a six-shooter. Mr. Nelse Seymour drew from under the table a scythe and a policeman's club. After a few minutes devoted to the consumption of soup and fish, Mr. Niel Bryant jumped up and announced that if anybody said that his friend Jobson's History of the French Revolution was not as good a book as Carlyle's, that person was a liar and no gentleman. The intelligent reader will doubtless have by this time perceived that these extraordinary proceedings were or are intended by the *Herald* to be supposed to have been directed towards the mystification of Mr. Philip Lee. All the guests rose suddenly at Mr. Bryant's challenge, and those who had weapons seized them. Mr. Sothern, by way of tranquillizing his guest Mr. Lee, assured him that Mr. Jobson, whose History had been compared with that of Carlyle, was "quite an eminent scholar, and a very estimable gentleman." Somebody told Mr. Bryant that he was another, and then shots were fired, and the room was filled with smoke and uproar. One of the guests thrust his "huge foot" through the soup tureen, and could not extricate it. The hotel became alarmed, and efforts were made to burst open the door, which had been fastened. Ultimately it became clear to Mr. Lee that all this was a huge practical joke, of which he was supposed to be the victim. The dinner of himself and everybody at table was spoiled, and, as Mr. Willet remarked, after the rioters had sacked the "Maypole," "there was a trifle of broken glass." It is hardly possible to suppose that there was not some foundation in fact for the *Herald's* story; but it may have been embellished in the telling. One of the party being knocked or falling down in the scrimmage, blackened his eye with burnt cork; and this trick, being observed by Mr. Lee, opened his eyes to the simulated character of the quarrel. We omitted to notice that Mr. Lee, who weighs 143 lbs., is described, and we should think with accuracy, as a good-natured gentleman. If the row had occurred

after dinner, the story would have been comparatively credible, but even the most reckless practical jokers of former times in England seldom disturbed themselves or others during the usual hours of dinner. After the incident of the burnt cork Mr. Lee politely thanked the company for the entertainment they had afforded, and withdrew.

But this comedy, or the recital of it, did not end here. Messrs. Sothern and Florence now took into their confidence Judge Dowling, who is described "as a most terrible practical joker," and who appears to have justified that character. The plan was that Mr. Sothern should pretend to believe that a duel was imminent between Mr. Florence and Mr. Lee, and that Judge Dowling, on Mr. Sothern's information, should have Mr. Lee, as the challenger, arrested and bound over to keep the peace. Our faith in the accuracy of the *Herald* is rather strained when we arrive at the point where Judge Dowling appears upon the scene. He did not, according to the story, arrest Mr. Lee; but he caused subpœnas to be served upon Messrs. Sothern and Florence, commanding them to appear and give evidence at the Tombs Police Court at half-past seven on the morning of December 20. These missives were placed in the hands of a sergeant of police for service. He served Mr. Florence while actually taking his morning tub, and he served Mr. Sothern while engaged in rehearsing *Brother Sam* at Wallack's Theatre. The subpœnas were served between eleven and twelve o'clock on the 19th December. In the afternoon of that day Mr. Florence met Judge Dowling in the street, and rushing up to him, implored him to tell what these alarming proceedings meant. The Judge answered that it was his duty to preserve the public peace, and he should do his duty, and would not permit the shedding of human blood. The next incident was, as might be expected, a visit to Messrs. Sothern and Florence by a reporter of the *Herald*, who called for the purpose of interviewing them on the subject of a duel supposed to be in contemplation. "Both were thrown into consternation on learning that the omniscient *Herald* had become possessed of the facts in relation to the affair." We should say that the *Herald* was possessed not only of the facts, but of considerable power of imagination. It proceeds to state that Mr. Sothern was seen during that day at pistol practice, and that in his performance of Lord Dundreary in the evening he showed unusual nervousness. He may possibly have been nervous at the thought of having to get up early on a winter morning and pay a visit to the Tombs. But he, at any rate, knew that he was not going to fight a duel, and therefore pistol practice was unnecessary. It is the prerogative of novelists to know what a man does everywhere, but we were not aware that the omniscience of the *Herald* was equally extensive. However, we are told by it that Mr. Sothern and Mr. Florence "slept together" that night at the Gramercy Park Hotel, and endeavoured to console each other. Their conversation overnight is recorded, and at six o'clock in the morning they arose and "vainly groped for a match to illumine the thick darkness." Deprived of the gas, they dressed with difficulty and emerged into the snow to seek a cab. "It was a dreadful morning, resembling that on which the great Napoleon opened the bloody battle of Borodino." It is, at any rate, a fact that there was a battle of Borodino. But as regards the residue of the story we really do not know what to think. The two comedians, without breakfast and thoroughly disgusted, reached the Tombs a little after seven o'clock. They ascended the stone steps, "cursing their luck and each other." We may take it that this is what the *Herald* thinks they ought, as men of wit and spirit, to have done under the circumstances. They were in a very bad humour, and the court-room was as cold as an icebox. A sergeant of police had dogged them all the way from the hotel, fearing that they would take an early train and leave the city. After awaiting Judge Dowling for some time, they told the sergeant that they had had no breakfast. They were notified that they must not make a noise in court, and finally they were conducted to a little cold room, where they were locked in. Ten o'clock came, and still no Judge Dowling. "He had stayed away on purpose to carry out the joke to its utmost limits." They now applied to the sergeant on the subject of breakfast, and were told that it could be supplied to them at five dollars a head; and if they desired to write to their friends the charge for two sheets of note-paper and two envelopes would be two dollars. At half-past ten o'clock they were released, "and thus," says the *Herald*, "ends the joke of the biters bit."

We have heard many wonderful things of the law and its administration in America, but this is as nearly incredible as anything that was ever stated on the authority of a newspaper. It is easy to put aside the manifest ornaments of the story. But we seem to be under the necessity of believing the substance of it, which is that a judge caused a subpœna to be served by a sergeant of police in what purported to be a criminal inquiry, and that he did this as a practical joke. If such an incident had been introduced into one of Lever's novels as having happened in Ireland fifty years ago, it might not have been thought extravagant. But it appears, to say the least, out of place in New York at the present time. It would be easy to understand that a sham subpœna might have been served by a mock policeman, and that the persons to whom it was addressed might have been deceived by it. But if Messrs. Sothern and Florence lost a dinner by one practical joke, and a breakfast by another, they may possibly consider that the game is not worth the candle.

CRUELTIES IN LIVE CATTLE TRAFFIC.

IT is now half a century since an effort was first made to obtain by law more humane treatment for the creatures commonly designated "lower animals." The Act of Parliament (3 Geo. IV., c. 71) entitled "an Act to prevent the cruel and improper treatment of cattle" was familiarly called after its humane author, *Saint* Martin's Act. This law was amended in 1835, and a new and improved Act was passed in 1849. Knackers' yards were placed under supervision by a law passed in 1845, and in 1854 the use of dogs as beasts of burden was made illegal. Last year and the year preceding witnessed the passing of laws for the protection of both sea and land birds during their breeding season; whilst by the 32 and 33 Victoria, c. 70, Railway Companies were required to provide during transit food and water for the cattle conveyed by them. This continued and progressive legislation gives abundant evidence of a desire felt by Parliament to interfere for the protection of dumb animals against cruelties inflicted on them. Nor has public opinion been behind Parliamentary action. Many of us can remember the jeers and the jests with which the earlier prosecutions under "St." Martin's Act were witnessed, and we can compare such proceedings with the satisfaction almost universally expressed at the late Parliamentary legislation for the protection of birds. It is impossible not to recognize with pleasure this marked and growing interest in the protection of animals. Time was when it was called sport to indulge in bull-baiting, cock-fighting, duck-hunting, badger-drawing, and a number of other pastimes in which the torture of animals was always an exciting and attractive feature. Such painful exhibitions have altogether passed away, or only linger in the form of "battues" and "pigeon matches." This happy change has been accomplished, partly no doubt by the pressure of the laws to which we have just referred, but still more, we hope, by better teaching. We know more of the nature and endowments of animals. The acuteness of the special senses of many of these creatures has long been a subject of familiar observation. It is not difficult to trace amongst animals endowments of the nervous system of an order as high as those of special sense just referred to. We might mention numberless instances of the acuteness of their mental perceptions, of their docility, of their powers of memory, of their hates and their loves, of their fidelity, of their gratitude, and so on. These familiar facts teach us that creatures thus endowed cannot suffer injury without feeling pain even as man himself does; and that it is often their patient endurance, not less than their incapability of expression or of resenting injury, that prevents our knowing the extent of pain which they are made to suffer. Recognizing this progressive improvement in the past, we look for still further improvement in the future. Much has been done; there still remains much to do. We are more especially led to make these observations in consequence of some recent disclosures as to the cruelties to which cattle travelling by rail are liable. For example, it was recorded a few weeks ago that a number of cows in calf were sent from Scotland to the West of England by railway without food or water, and that when they arrived at their destination they were in such a state of suffering that several of them were immediately slaughtered as the only possible means of relief for their agony. A correspondent of the *Times* recently described as follows what he saw whilst waiting at one of the Eastern Counties' railway stations:—

> My attention was attracted to the up-passenger platform, alongside of which was a cattle train, by a succession of oaths, exclamations, and sounds as of blows of sticks rapidly delivered. On crossing the line to see what all this meant, I found an unfortunate ox stretched on its belly across the lowered door or gangway of one of the trucks. The poor brute lay panting, utterly exhausted, with his forelegs resting on the floor of the truck, his hind legs stretched out touching the platform. Half-a-dozen drovers surrounded the animal intent on overcoming his exhaustion, and on compelling him to get on his legs. The method which they adopted was this: two of the fellows dragged him by the horns, another twisted his tail, whilst one at each side belaboured his back and sides with rapidly falling blows of cudgels, only intermitted for the moment whilst the cudgels were used as goads. There lay the helpless brute, every now and then making a vain effort to rise, until after quite fifteen minutes' torture he was got upon his legs and pushed in among the other animals in the truck, where it was presumed that close packing would prevent his falling on the floor of the van and being trampled to death. On inquiry I learnt that these cattle came from Ireland. They generally arrive in Dublin from various parts of the country, and are immediately shipped for Liverpool, where they are trucked for various English markets—in this instance for Norwich. Fatigued by the journey in Ireland, knocked about and sickened in crossing the Channel, tired by travelling for many hours on English lines, often without food or water, one or more of the creatures frequently sink in the truck exhausted, and are trampled to death by the other animals. To meet this difficulty was the object of the proceedings I witnessed. The exhausted prostrate beast was dragged halt out of the truck and tortured until he was made to stand up again and resume his place among his fellow-travellers.

Another correspondent says that "it is well known that animals are frequently left in the trucks without food or water from Thursday to the Monday following." We have reason to fear that instances of like cruelty are familiar to most travellers by railway who have taken the trouble to look into the matter. It seems to us that a system so abounding in horrors requires but exposure in order to its being put an end to. The remedies for these evils, partial or complete as they may be, are quite accessible. It is strange that they have not already been adopted; for not only do the unfortunate brutes of whom we write suffer physical torture, but their money value to the owners is greatly lessened.

The first step towards a partial relief for these poor creatures is that taken by Parliament, to which we have already referred. By

the 32 and 33 Vic. c. 70, § 64, Railway Companies are required to provide food and water for cattle at certain stations, but, according to the usual muddling system, they are not required to supply either one or the other to the brutes, except on demand of the consignor. The consignor makes no demand, and the animals cannot help themselves. Hunger, thirst, suffering, and exhaustion are the results. The simple remedy would be a bylaw of the Railway Company, or an order in Council prohibiting the reception of cattle for conveyance by railway unless the consignor agreed to pay for, and the Company undertook to supply, the food and water necessary whilst the animals were in their possession.

In the second place, it seems that cattle are conveyed in trucks sufficiently well adapted, it may be, for the conveyance of wood or coal, but unfit for the conveyance of living animals. The trucks are in many instances unprovided with means of shelter from the weather, or of breaking the shocks which occur in shunting, these shocks being all the more severe in consequence of the looseness of the couplings in luggage trains. Cattle trucks are mixed up with these luggage trucks, and they are of course liable to be frequently shunted and delayed, whilst the unhappy beasts are knocked about, frightened, hurt, and fevered, with the result of rendering their flesh more and more unwholesome for human food. If live cattle should continue to be sent by rail, a better system of railway organization for the purpose becomes an absolute necessity. These, however, are at best but partial remedies. The complete remedy is one which we believe will sooner or later be adopted. It is the substitution of the carriage of the flesh of the animal prepared for sale for the carriage of the living beast itself. The advantages of such a system are great and manifest; the difficulties of adopting it, fictitious and factitious as they are, are surmountable. It is an established fact that the flesh of animals killed near their fattening ground is much sweeter and more wholesome than that of the tortured, fevered beasts killed in close and filthy slaughter-houses. There is also an absolute loss to the owner of the cattle that have travelled long distances by railway. A fat ox loses in a journey from Scotland to London from one to two hundredweight or more. Again, from another point of view, if five or six thousand oxen are weekly slaughtered in London, it may be calculated that a shipload of manure is weekly brought to our doors polluting our atmosphere, whilst, if this material were left in the country, the land would have profited by its presence. Difficulties no doubt exist, and objections have been made to the adoption of this dead meat traffic. The first objection is a singular one, and it is this—that the carriage of a live animal costs considerably less than does that of a part of his body when dead. Trouble for trouble, weight for weight, and bulk for bulk, no one can doubt that the charge for a portion of the dead animal should be less than the charge for the whole of the living one. It is, however, not so. No doubt this anomaly is due to the terms made by agriculturists with the railway constructors in the infancy of these undertakings. The cattle-breeders secured the conveyance of their live stock at a cheap rate, whilst meat is carried at the rate of ordinary merchandize. We do not say that cattle are carried too cheaply, or meat at too high a charge, but it is time that these anomalous charges should be revised.

It is said that butchers could not adapt their supplies to their wants if they had not the animals within their immediate reach for slaughter. But this objection cannot be maintained when we know what the telegraph under an improved system can accomplish. Lastly, it is said that, practicable as the system may be in cold weather, it would break down in summer. We doubt this; the carcass of an animal killed in the country in the afternoon could be sent with perfect safety in properly constructed vans during the night to London or other large towns. The like objection was made to the supply of milk; but now London and other cities receive a large supply of milk during the entire year from the country. What has been done in the case of milk can and ought to be done in the case of meat, as it is indeed done now to a great extent, and was done almost exclusively during the year of the cattle plague; for then, as will be remembered, the movement of live cattle was prohibited. For London, the chief of cities, a dead meat supply, and no other, must ere long be established, inasmuch as slaughter-houses must happily very soon cease to be found amongst us. The period of grace for their removal—a long one, no less than thirty years—given by Act of Parliament (7 and 8 Vic. chap. 34, § 65), will expire in 1874, and we earnestly hope that by that time, if not sooner, the traffic in live fat cattle will have been brought to an end, and with it a series of cruelties which are discreditable to our age and country.

THE SCULPTURES FROM EPHESUS.

NOW that the excavations on the site of the Temple of the Ephesian Artemis have yielded some fruit, it may be useful and interesting to test its quality, and to inquire into its nature and value. Sufficient materials are already before us upon which to form some estimate; though further success in the work upon which Mr. Wood is again engaged at Ephesus will, it is to be hoped, furnish further and richer data for a conclusion. At the present moment we shall confine our remarks to the sculptural fragments which have reached this country; and we propose to make some attempt towards fixing their true place in our national collection, and in the history of Hellenic art generally.

It is of immense importance that the period of these remains can be assigned within about a quarter of a century, for their technical peculiarities sufficiently stamp an epoch, and light is much needed as to the characteristics of the schools of sculpture of the Alexandrine and immediately following period. With the exception of coins, we have few remains which can with certainty be referred to that era, for the test afforded by works existing in Museums, and reputed to be copies of originals by Scopas, Praxiteles, Lysippus, and others, is after all based upon circumstantial evidence. Even could the attribution of the supposed originals be satisfactorily proved in any case, we should still not be free from doubt as to the faithful adherence of the copyist to the finer traits of the master's chisel, and our doubts would be justified by the number of *repliche* in some instances, severally differing in absolute merit, and the best perhaps differing, we cannot tell how much, from the prototype. It is therefore of the first necessity in such questions that the period and *provenienza* of a given work should be beyond dispute.

The sculptures from the Artemision bear internal evidence of the approaching decline of the great schools of Hellenic art, and are so far in agreement with what we know from independent sources. The fatal influence of the Peloponnesian war, which had drained Athens of its treasure and its manhood, and had shaken the whole of Hellas, left no room for the undertaking of such public works as had distinguished the Periclean age. The sublime and spiritual school of Phidias could have found no echo in that internecine clangour, and as little welcome amongst the new generation, with its political and social corruptions. But the point of perfection to which it and the rival school of Sikyon had carried the means of art could not easily be forgotten or extinguished. Athenian artists sought refuge and employment elsewhere, chiefly in Asiatic Greece. The seed sown ripened to a fresh harvest, differing indeed from the former with the difference of the social soil from which it sprang, but still retaining traces of its noble origin. Scopas, Praxiteles, Leochares, and Bryaxis, revived or continued the Attic traditions. Euphranor and Lysippus sustained the fame of the school of Sikyon. We know that the rebuilding (it was no mere restoration) of the Temple of the Ephesian Artemis was contemporaneous with the labours of some or all of these masters. Nay, more, we have reason to believe that both Scopas and Praxiteles contributed to its sculptural decorations. Bearing these things in mind, we may proceed to examine the fragments before us in detail. They include, as will be known to such of the public as have looked for them—1. A portion of the lower and sculptured drum of a column. 2. A smaller portion of a second. 3. A piece, the architectural place of which it is difficult to allot, but which certain marks would lead us to suppose may have belonged to a sculptured podium. A more shattered piece, pretty surely pertaining to the same object, or having a similar use, has since turned up in the excavations, but has not yet reached us. The two drums are from every point of view the most interesting among the objects enumerated. Apart from their artistic worth, they possess an exceptional value for the student of art history and for the scholar. For their discovery, as has been already sufficiently made known, satisfactorily clears up and justifies a passage in Pliny which hitherto could only be reconciled with our knowledge and beliefs about the practice of the Greeks in art by assuming its corruptness and suggesting at best lame emendations; not indeed that the clever guess of Winckelmann, adopted by Brunn, quite deserves that title.

Strictly speaking, the sculptures in question must be considered as subordinate to the architecture. They may be classed under the head of zophori, though that term is generally confined to friezes bearing the figures of living beings. Applied as these groups are to columns, the limitations in treatment were narrower than in the case of a continuous frieze, where rhythmical order and proportion, alternate repetition and contrast of masses and lines, and symmetry and variety aiding and balancing each other, offered full scope to the inventive skill of the artist. But here the opportunities were diminished and the difficulties increased. There is evidence to show that the sculpture was confined to the lower drum of the columns, embracing about six feet of the shaft, above which the usual Ionic fluting was continued to the necking or the capital. To enrich the pillar without breaking its continuity, to harmonize the lines of the composition with the vertical lines above, to preserve the individuality of the parts without sacrificing the integrity of the whole, were the problems which the sculptor had to solve. In the mere arrangement of figures on rounded and cylindrical surfaces the ancient artists had long been practised. Puteals, round altars, and, above all, vases had given free play to their invention in this direction. And the adornment in this wise of the columns of a temple which was meant to surpass all others in splendour as in extent was but a new application of the same species of ornament. The idea scarcely sprang all-armed from the brain even of a Dinocrates. Here the adjustment of the figures to their cylindrical ground with reference to the column is worthy of study. A system of relief was chosen which may be said to hang between alto and basso, though it approaches more to the latter, and never fully attains the former, which would have necessitated either inconvenient projections, or the sinking of the ground within the general diameter of the column. So masterly has been the use of this semi-alto in the figure of Hermes, where the management of the nude made it most of all difficult, that even in oblique views the eye is not afflicted by a sense of incompleteness or distortion.

Beginning with the half figure to the extreme right on the less

injured drum, we may pass it by with the remark that it indicates a male personage seated, clothed at all events as to the limbs, and sandalled with the ornamental footgear which is familiar to us through the Belvedere Apollo and hundreds of other examples, and which invariably distinguishes rank amongst gods and men. The headless female before him and facing us is clad in the long chiton girt as diploidion. Behind her—whether fastened on the shoulders or depending from the head is uncertain—hangs a mantle, reaching to the calf of the leg. The dress is not unusual; but its disposition, and the pose of the figure itself, recall in some respects the noble statue at Munich known as "Lenkothea." The left hand, raised towards the opposite breast, holds an object which once extended to the now lost right, and as to the nature of which we can form no plausible guess. It most nearly resembles a *sphendone* or diadem of some sort. Proceeding leftwards, we are greeted by the unmistakable figure of the athletic, youthful Hermes, resting on the right foot in momentary pause, holding the lowered kerykeion in the right hand, and looking upwards with parted lips, as if awaiting a command from above. The left arm rests by its hand behind the hip, and is furled in the drooping chlamys. Beyond Hermes is a second female figure, fronting us like the first, but clothed in more matronly fashion. She wears over the fine half-sleeved chiton the peplos, a corner of which she raises across and above the waist with the right hand, while the now effaced left evidently once sustained a second corner, as if she were about to unite both upon the shoulder, or possibly only to adjust the left portion upon it. The cast of the peplos is of extreme beauty, and its execution leaves little to be desired. The same may be said of the inner garment where it covers the bosom, and where it again appears descending in fine folds to the feet and furling over them. The last shape which meets our eye is one of rare attractiveness. A youth faces us with long drooping wings; his head, with heavy parted hair, inclines to his left with a pathetic expression, and his left hand is raised, as if beckoning. A weighty sheathed sword hangs by his left haunch. The right arm, together with a large portion of that side of the body, has been struck off. On the shattered surface beyond him we may still trace the remains of a seated male form, partially draped. The nude winged youth is the figure which would alone stamp the era of the entire work. The pathetic character points to the new Attic school, no less than the almost feminine softness of the forms, though the marked androgynous type of a later period does not declare itself. Here we still see in the square shoulder, and the pronounced roll of the muscle above the knee, the distinctly masculine character. The workmanship of this figure is not careful. It is a magnificent sketch by a practised and fearless hand; the object being the expression of the whole rather than any careful individualizing of parts. Perhaps greater pains have been bestowed upon the figure of Hermes. The more complicated curves and markings incidental to a maturer form necessitated greater care. The body is shorter in relation to the length of the limbs than in works of the older Attic school, and the mass of the head rather exceeds the usual proportions; though this effect is chiefly due to the flattening of the thighs in semi-alto relief, whereby their apparent volume is decreased. This is no doubt a blemish, but we have not to criticize an independent piece of statuary, and the figure as it stands can fail to strike no one as an image of athletic grace and vitality. As a study of comparative art it has points of interest which should neither be overlooked nor emphasized too strongly. The treatment of the hair, for instance, and the somewhat high position occupied by the calf upon the leg, may point towards the Lysippian school. Neither can be regarded as accidental peculiarities here, though we may so designate the largeness of the head. The right and only visible hand of Hermes is carved with truth and delicacy, differing remarkably in these respects from the hands of the female figures, which in both instances are almost clumsily wrought, and in the action common and plebeian. These disparities, as well between the separate figures as within each in itself, would give rise to the conjecture that even upon this limited group two or more chisels had been at work. Perhaps the nude and the draped figures were respectively given to different hands. Or may we here, and within this small compass, trace the contending or coalescing influences of separate schools? But, whatever the technical faults of this fragment, the composition which it presents sways us with an undefinable charm, and this in spite of the loss of the two female heads, the presence of which would add immeasurably to the effect upon the imagination.

We may conclude that each *columna cælata* contained a substantive and closed composition. The theme of ours it may be premature to guess at, but it easily suggests some subject connected with the katacthonian deities. The presence of Hermes, *κήρυξ μέγιστος τῶν ἄνω τε καὶ κάτω*, gives colour to this hypothesis. The sitting figure may perhaps be Pluto; the female before him, Persephone; the other female, Demeter. The last mysterious figure, which, from its wings and its bodily type, has been thought to represent Erôs, we should venture to call Thanatos. What attribute, if any, occupied the now destroyed right hand, it is impossible to say. It may have been an inverted torch; and the hand was certainly directed downwards. But it is the head which most strongly [illegible] to the character of the genius of Death, as conceived by the Greek imagination. A dreamy *Sehnsucht* pervades [illegible] most sexless face; a sadness as if Death himself felt that [illegible] was but the victim of an inexorable Fate whose behests he must execute; and the lax unwavy hair is drawn back behind the ears as if carelessly confined there. The ambrosial locks of Erôs are, on the contrary, curly and rippled, and hang in tresses on the shoulders, or are knotted in clusters behind the head. We think, however, that the presence of the sword decides the question, and we recall the passage in the *Alkestis* of Euripides where Thanatos appears armed with a sword ready as "Priest of the Dying" to sever the lock from the victim sacred to Persephone:—

> ἡ δ' οὖν γυνὴ κάτεισιν εἰς Ἄιδου δόμους.
> στείχω δ' ἐπ' αὐτὴν, ὡς κατάρξωμαι ξίφει·
> ἱρὸς γὰρ οὗτος τῶν κατὰ χθονὸς θεῶν
> ὅστις τόδ' ἔγχος κρατὸς ἀγνίσῃ τρίχα.

This unique illustration of a unique passage adds in no small degree to the interest and value of the long-buried fragment. From an archæological point of view it is worthy of remark that the baldric (telamon) by which the sword is slung is a double parallel cord, seemingly covered with leather, and unknown to us in any other instance save, strangely enough, on an archaic metope of one of the temples at Selinus, where the scabbard of the warrior in strife with a goddess (perhaps Athena and Enkelados) is sustained by a cord exactly similar.

The female, probably divine, assemblage on the second drum presents us with some remarkable points of beauty. The foot, for instance, of the sitting figure on our left is finely formed and wrought. The drapery throughout is beautifully disposed, and though broadly and sketchily handled, shows command of the material and implements, and a thorough knowledge of the plicature of woven stuffs. The clothing here, as in all true Greek art, was not an object of primary care to the artist, but was used as an adjunct to express the character and action of the figure. Two of these figures are seated upon frusta of columns, a motive not infrequent in ancient reliefs and paintings. Possibly we may trace in this group, and even in the other, the progress of a pictorial mode of viewing sculpture in relief. The art of painting, at the era when these works were produced, was attaining, or had attained, its culminating point. Ephesus itself gave birth to Parrhasius, and became the adopted home of Zeuxis when the Peloponnesian War had banished art from Athens. Apelles was developing his genius there while the new temple was in progress. A mutual reaction of the two great branches of formative art might be reasonably looked for.

Whatever may have been the effect of these adorned columns upon the eye used to the severe grace of the Ionic order; whether the general aspect of the building was improved by them, and whether they may be recommended for imitation after the one splendid and colossal experiment, the impression made by them upon one first entering the fane must have been overpowering. We may try to imagine what it was, beneath the brilliant sky of the "Asian Meadow," to wander in this grove of peopled columns,

> . . . . . with brede
> Of marble men and maidens overwrought,

lighted by wondrous reflections cast from one upon the other, and from the walls of the cella and the marble pavement below; but we shall but poorly realize the effect which it required the spectator's movement and ever-changing place in this still and magic world to complete. Of this at least we may be sure, that what the Greeks imagined and attempted they were unlikely to fail in accomplishing. Unfettered by precedents and rules as the artist of that time as yet was, and certain of appreciation from an impressible and imaginative race, he had but to give form to the conceptions of his rich thought.

The third fragment, a corner-piece, whether of a podium, frieze, large altar, or what not, and which was once crowned by a rich cornice, presents on both faces remains of three human figures, of which one only—that of a draped female—is in tolerable preservation. We have not space to do more than touch upon this figure from the technical side. The action is energetic and true, and the form is filled with that vitality which is never absent from genuine Grecian art, even when far from its highest. The agitated drapery is roughly but expressively carved, but in manner of conception and treatment differs widely from that of the greater Attic school. Here, on the contrary, we are rather reminded of the drapery of the Niobids of the Museo Chiaramonti in the Vatican. There is the same sharpness and squareness, the same multiplicity of folds. It will be instructive to compare it in our examples with that of the "Iris" from the eastern pediment of the Parthenon. The block more recently found, and structurally corresponding with that just mentioned, is also a corner-piece, and shows on the one face a mutilated but grandiose male torso, in heroic action; on the other, traces of the head, neck, and antlers of a deer. Did the entire composition portray the Labours of Herakles?

On the whole, we have reason to congratulate ourselves upon the sculptural products, scanty though they as yet be, of the excavations on the site of the renowned Artemision. Besides their æsthetic worth, which is not unimportant, they will form a valuable contribution to our knowledge of a period of art about which we have much to learn. We are glad to know that the authorities of the Royal Museum at Berlin, with that enlightened zeal for art which distinguishes them, have applied for casts from these works, which will be placed in the superb collection of casts from the antique forming part of that institution.

THE THEATRES.

THE popularity of Mr. Gilbert's fairy comedy has been sufficiently manifest at the Haymarket Theatre during the past week. His success is one of the most surprising, and at the same time gratifying, incidents in the history of the modern stage. The playbill mentions the composers of the incidental music and of the dresses, as if they were of equally great or small importance, as probably they are. Indeed no play could easily owe less of its effect to accessories than this does. It is very well written and tolerably well acted, and that is all. The ludicrous appearance of two tall gentlemen in gowns, who represent male fairies, is happily terminated by their despatch from fairyland—where one cannot help feeling that they must be very much in the way—to earth. The idea of the play is that every fairy has "a perfect counterpart in outward form" among mankind. The personal resemblance is supposed to be complete, but the circumstances and character are different, or rather, in fairy land circumstances are unchanging and its inhabitants have no character at all. The popular idea of fairies seems to be that they are all female, unless they happen to be malevolent, and this idea is practically convenient. But the idea of Mr. Gilbert is to distinguish the sexes among fairies while exempting them from the influence of love, and it is difficult to develop this idea without verging on absurdity. It was perhaps on this account that the practice became common of representing cherubs on monuments with nothing to sit down upon. It is true that Shakspeare, who has largely influenced English thought on all subjects which he touches, introduces a fairy king as well as queen, and, having got as far as that, he makes them liable to human passions. Titania, as we all remember, reproaches Oberon for his gallantries, and he answers by what is called in the Divorce Court a counter charge. This quarrel has disturbed their subjects' sport, and even caused disorder among the elements, and confused the seasons:—

> The winds, piping to us in vain,
> As in revenge, have suck'd up from the sea
> Contagious fogs, which, falling in the land,
> Have every pelting river made so proud,
> That they have overborne their continents.

If Mr. Gilbert's view of the fairy world be correct, the abnormal weather which now prevails cannot be ascribed to matrimonial bickering between Oberon and Titania. If there is no love there can be no jealousy, and the fairies lead a life free from emotion and excitement, in which the ladies do fancywork and the gentlemen do nothing in calm content. It is the habit of men to think that this kind of thing might do for women, but would be intolerable to themselves; and this is perhaps the reason why fairies are usually represented of the feminine gender, or of no distinct gender at all. But Mr. Gilbert's story requires that two knights should be brought from earth to perturb the blissful abode of the fairies; and thus he is compelled to produce the fairy counterparts of these knights, who look as much at home as a modern husband in his own house immediately after his wife's confinement. As long as the knights' visit lasts, fairyland is a tolerably lively place; but when they return to earth, it seems likely to become as dull as a country town after the races. Indeed this is not an adequate comparison, for a provincial beauty can always look forward to the next ball; but there can be no possibility of any event which can bring any nice young men to fairyland any more. This reflection throws a shade of melancholy over the last scene. We do not like to contemplate the condition of all these young and pretty creatures, singing all day long "Nobody coming to marry me; nobody coming to woo." We are reminded of the profane American who said that, doubting his own fitness for heaven, and also heaven's fitness for him, he was willing to accept plantation life "down" in full of all prospects of celestial felicity. It may be true of a human maiden that

> 'Tis better to have loved and lost
> Than never to have loved at all;

because she is at least able to sympathize with the sorrows of her friends. But in fairyland there would be no sorrow except that of the immediate victims of the fascinations of the two knights. There is something almost tragic in the prospect of unbroken tranquillity on which the curtain falls. The knights return to earth, where other mistresses await them; but the fairies will find their home henceforward like what, let us say, Doncaster would have been if a respected inhabitant could have persuaded his fellow-townsmen to abolish the races. Imagination exhausts itself in seeking a parallel for the misery of unalloyed happiness. Perhaps a passage to Australia in fine weather, with comfortable berths, a well-served table, and no flirtation might come near it while the passage lasted; but that can only be for a few weeks. For the dwellers in fairyland, an eternal existence is appointed without change, or fear, or hope. It is impossible not to sympathize with the longing which they express for a share of the pleasures and pains of the wicked world upon which from their cloud-mansion they look down:—

> With all their misery, with all their sin,
> With all the elements of wretchedness,
> That teem in that unholy world of theirs,
> They have one great and ever-glorious gift,
> That compensates for all they have to bear,
> The gift of Love!

The speech from which these lines are taken is a good example of Mr. Gilbert's power of intermingling pleasant satire of the existing world with the discourse of ideal characters. The greatest miracle that love works is that it blinds the maiden to her lover's faults. In her eyes he becomes

> Wise in his folly, blameless in his sin.

When love is introduced into fairyland it works even more potently than on earth. The Gothic knight to whom the Fairy Queen innocently avows her passion is as selfish as a middle-aged bachelor of modern time; yet she loves him all the more for his cruel confession of indifference. When the time comes for the return of the knights to earth, they expend little emotion on parting from their fairy loves. It must be owned that Mr. Gilbert has not drawn a flattering picture of his own sex. The maxim of Sir Ethais seems to be that one woman is as good as another and better, and he not only thinks this, which is bad, but in effect says it, which is worse. After such unsatisfactory experience of mortal love, the ladies of fairyland resolve that they will have no more of it, and if the piece could end here it would be well. But unfortunately, when the knights return to earth, the fairy counterparts of the knights return to cloudland, and one cannot help feeling that upon this question of excluding love the gentlemen have a right to be consulted. It would appear, however, that the female fairies have not only obtained the suffrage for themselves, but have disfranchised the males. The case is harder because the knights' counterparts have been on earth and tasted its pleasures, and may possibly have been more fortunate in their lovemaking than the fairies who have rashly bestowed affection on heartless knights. It is quite possible that these he-fairies have enjoyed their visit to the wicked world, and would like to introduce some of its manners and customs into fairyland. If the actors who play these parts looked ridiculous before they changed from long-clothes to coats of mail, they look much more so now that they have changed back again to long-clothes. They suggest the idea of two big boys who were sent to a girl's school when they were little, and whose parents have forgotten to take them away. But we cannot laugh at them for pity. They perhaps may have found love on earth agreeable, and would like a little more of it. But the she-fairies apply a sort of permissive prohibitory law, and vote that there shall be no more love. If we are sorry for the ladies, we are ten times more sorry for the gentlemen, who not only look, in their petticoats, as if they could not help it, but really cannot. We almost feel inclined to ask Mr. Gilbert to alter his play, as some playwright altered *Lear*, and mitigate the mournfulness of the conclusion. There might be at least on three nights of the week a partition of fairyland by treaty. Let the ladies do as they like in one half, and the gentlemen do as they like in the other. The ladies can, and of course will, adhere to their resolve of non-intercourse with the wicked world, and the gentlemen can please themselves. An old lady is said to have told a young lady that she had seen the folly of pleasure. The young lady answered that she wished to see the folly of it likewise. The gentlemen fairies might perhaps answer the lady fairies in the same way. It is finely said early in the play that the love of mortals bears like relation to that of fairies

> That the fierce beauty of the noonday sun
> Bears to the calm of a soft summer eve.

The he-fairies might perhaps desire to bask in the summer sun a little longer. They would be content with evening when it comes, but need not desire to push on the clock. At any rate they ought to be allowed to vote upon the question of their own disfranchisement.

The satisfaction arising from the success of the *Wicked World* will be heightened by observing that the sensational drama has for the time become almost extinct in London. At the Holborn Theatre may be seen an "original domestic drama," in which occurs a fire and also a supposed drowning in real water, which is made to splash in an impressive manner. But these effects are introduced with a modesty which is at once new and agreeable. The author has taken some pains to write his play, and the manager has endeavoured to collect a tolerable company to act it. We fear, indeed, that he may fall between two stools. His play is good, but not good enough to attract without more startling effects. The incidents and characters are thoroughly well worn, and when we get to the comic Irishman we are tempted to ask where is the originality of the piece unless it be in making an audacious experiment on our patience. However, the piece is a very mild example of the sensational class of drama, and it is, we believe, the only one in London. Two theatres are playing the *School for Scandal* and one is playing the *Rivals* nightly. At another house a more modern comedy, *Money*, holds firm possession. Historical drama is strongly represented by *Charles I.* and *Cromwell*. It is possible that all or some of these pieces may run for months, and indeed it has come to this, that any good new play or well-selected revival will keep a theatre going for a year. This is of course pleasant for managers, but the public may ask with some anxiety how young actors are to learn their business. However, if they must play the same part for a year, it is some consolation that the part belongs to a good play.

REVIEWS.

WOOD'S JOURNEY TO THE SOURCE OF THE OXUS.*

JUST thirty-six years ago an officer of the Indian navy, Lieutenant John Wood, was appointed assistant on the Commercial Mission to Afghanistan which was entrusted to Sir Alexander Burnes. While the chief of the expedition remained at Cabul, Lieutenant Wood and Dr. Perceval Lord penetrated the regions beyond the Hindu Kosh, and the former, leaving his companion at Kunduz, with some native attendants explored the Valley of the Oxus right up to its source. The fate of the three adventurous officers is remarkable. Dr. Lord was killed by a shot from a native fort at the battle of Purwandarrah on the 2nd of November, 1840, just one year before the fatal outbreak at Cabul. The historian of that dark and disastrous period relates how, at Purwandarrah, the "native troopers fled like sheep," and the English officers, unsupported, charged whole squadrons of Dooranee cavalry. The assassination of *Secunder* Burnes, as he was termed by the Afghans, forms one of the most striking passages in the volumes of the same accomplished writer. This event happened in the subsequent year, 1841, on the same day of the same month. Lieutenant Wood, having had grave misgivings as to the result of our military occupation of Cabul, long ago quitted the Indian service, emigrated to New Zealand under a mistaken notion of the prospects of that colony, left the South Seas, failed in again obtaining employment in India, then tried Australia, returned to England in 1857, for some years superintended the steam flotilla formed for the navigation of the Indus, and died very recently, after outliving his adventurous companions for more than thirty years. This book is a reprint, or rather a new edition, of the "Journey" by the son of the author; and it is prefaced by a critical disquisition on the geography of that unknown tract from the pen of Colonel Yule, who is well known to have possessed, while in India, the entire confidence of Lord Canning, and to have since given to the world an excellent version of the *Travels of Marco Polo*.

Our business must be first with the explorer himself. Lieutenant or Captain Wood, to judge him from his own writings, appears to have been a man of a straightforward, honest, and fearless disposition, occasionally given to strew his pages with moral reflections and truisms; capable of enduring fatigue and hunger, and animated generally by that delight in exploration and adventure which is characteristic of members of the naval profession. In truth, the services of officers of that extinct service, the Indian Navy, were not always appreciated in their day, and are almost forgotten in our own. By a few they are only remembered as commanding the steamers which conveyed the Indian mails from Suez or Aden to Bombay at the modest rate of six miles an hour. Yet it is to them that we in a great measure owe our knowledge of the soundings of Aden harbour, of the depths of the Red Sea, of the island of Socotra, of the currents of the Indian Ocean, and of the shores of the Persian Gulf. By their labours, pursued under a burning sun, or a fiery blast from the sands of Arabia, or a tropical deluge in the monsoon, have been accumulated ample stores of observation on nautical phenomena and facts; and in the two Burmese wars, as well as in the Indian mutiny, they were seen working guns and attacking palisades in honourable rivalry with officers and sailors of the Royal Navy. About eleven years ago, in one of those cold fits of doubtful economy from which few statesmen can escape, the Indian navy was abolished as an encumbrance. The loss was speedily felt; and it was one of the several politic acts of Lord Mayo that he at length obtained from the Admiralty a squadron of vessels suitably manned and equipped for continuous service, in the pay and under the orders of the Indian Government, in the Persian and Arabian waters. Attempts to coerce slavers and to entice reluctant chieftains into treaties which must be kept, require, it need hardly be said, something more than mere diplomatic skill.

To return to Lieutenant Wood and his book. That affairs in Central Asia require all the light of past experience no one will deny. One part of this volume is instructive as dealing with a region which only one Englishman has trod. Another is interesting because it mentions places where the palaces, courts, and chases of native rulers have, in the last twenty or thirty years, been succeeded by the British Cantonment and the Cutcherry, the race-course and the gaol. In one chapter we have a picture of a bleak steppe or a Kirghiz encampment such as we read of in Vambéry. In a second we find Dost Mahommed playing chess at Cabul, as he has been seen by men still living to play that game at Calcutta with one of the sisters of the late Lord Auckland. The reprint of the work, though creditable to the editor's filial affection and judgment of its geographical and political importance, might very well have been revised and improved. In the first place, the spelling of Oriental names is based on no one regular principle, and varies from the rigid pedantry of the accurate school to wild aberrations of individual fancy. At the commencement of the work we have the system of transliteration employed after a fashion which would have delighted the late Horace Hayman Wilson. As we get further into Afghanistan, towns, places, proverbs, and phrases are written with the amount of phonetic precision which we might expect from some honest captain of a merchantman who, landing at an Indian Presidency in the middle of the last century, amazed his friends at the East India Docks on his return with wonderful stories about Moormen and Gentoos. It was, too, hardly necessary to tell us that a painter is "the rope by which a boat is secured." It was surely incumbent on the editor to have explained or translated such a sentence as "the women were walking among the Zird Alu trees, now partially in blossom." These words are not symbols for any remarkable botanical novelties. They are simply the Persian for "apricots," from *zard*, yellow, and *alu*, a potato. In short, as so often happens in similar cases, we have some information which we did not want, to compensate for the absence of the note which would have made things plain to the general reader. In the same way we are told of "handkerchiefs made from the silk called lab-i-ab, the produce of worms reared on the banks of the Oxus." The last words of this sentence are in reality a translation of the Persian *lab*, bank, and *ab*, water. But we are not told so, and there is no indication that the writer understood the force of the expression. The word "gup," though current amongst Anglo-Indians to express popular rumours and the small talk of society, is derived from a Sanskrit word, and is not Persian at all. Consequently we very much doubt its entering into the conversation of a domestic circle of Mahommedans in the villages of Badakshan. Lieutenant Wood in this instance probably thought and spoke in familiar Hindustani, while he intended to speak Persian. *Chopper kallu* is certainly not Indian for chess; at least, it is not the term by which this ancient game is usually known to those who speak a derivative either of the Indo-Germanic or the Semitic languages. Chess is *chaturanga*, or "four members," corrupted into the Persian *shatranj*. *Chaupar*, or *chopper*, is a common word for dice. If chess is known at Shikarpore in Scinde as *chopper kallu*, it can only be by some local or provincial usage. *Soorsat* is an obvious mistake for *russud*—*i.e.* provisions for the army—and is familiar to every subaltern or captain who, at the head of a company of sepoys, has had to "requisition" the civil authorities for supplies for his men. It is incumbent on us to point out these tiresome errors, because, with the increased interest shown in India and Central Asia, and with the number of officers and civilians always at home on leave, rectification was a very easy task. An editor who undertakes to give to the world some memoir, life, or narrative in which the employment of Eastern phraseology is unavoidable, should submit his proofs to an expert. He is no more justified in making guesses at truth on such topics, or in avoiding necessary explanations, than an ordinary father of a family would be in drawing up a marriage settlement for one of his daughters without referring the deed to a lawyer.

The editor, however, is fully justified in the step which he has taken; and the narrative is full of incidents experienced by the traveller himself, as well as of glimpses and revelations of Oriental life. The line taken by Lieutenant Wood and his companions, concisely stated, was as follows:—Entering one of the mouths of the Indus, they sailed or tracked up that river to Attock; thence by Peshawur, the Khyber, the fort of Ali Musjid, and Jellalabad, they reached Kabul, where they were introduced by Akbar Khan, then quite a young man, to his father, the Dost. Leaving Burnes at the capital, Lieutenant Wood and his companion, Dr. Lord, started in the month of October 1837, and after a vain attempt to enter Turkestan by the Eastern passes, returned, crossed the river Helmund, passed through the Hazara country, and reached Bamian by the Pinauri defile and the valley of Zohák. Having thus got over the range of Hindu Kosh, their course, after a time, lay nearly due east, through Kunduz and Jerm. Dr. Lord remained at the former place, and Wood, with a native factotum named Ghulam Hassain, with Abdul Ghani, an officer of the household of Murad Beg, who then ruled in Badakshan, and with a few native followers, made his way through the Wakhan country to the plateau of Pamir and to the source of the Oxus. Our space allows us to do little more than touch on particular points in the narrative, but we must impress on our readers that Wood was the first Englishman, and the only European, who had visited the source of this famous river since the days of the adventurous Venetian, Marco Polo. Other men will doubtless hereafter track his footsteps, benefit by his leadership, and possibly supply his deficiencies; but we have the testimony of Colonel Yule for believing that, in all essentials, his account is accurate, honest, and trustworthy; and no reader of the book will fail to appreciate its manly tone, or refuse to acknowledge that its author had a good deal in him of that pluck and determination to which we owe the solution of the far more difficult problem of the sources of the Nile.

The following will give some idea of the country, people, and manners which came under Wood's observation. The Afghans and Badakshanis appear to have been generally hospitable, fond of talking round a fireside, and grave and humorous by turns; but we hardly think that Wood's estimate of their veracity would be borne out by the opinions of Indian officials who have served on the frontier of late years. And, so far from considering them inferior to the Sikhs, as the author evidently did, we should prefer a bearded Sikh proprietor from the Manjha to an Afghan from the Khoord Kabul. Abdul Ghani, Wood's guide and companion, seems to have been a compound of Roger Wildrake and Andrew Fairservice, rollicking as the one, sententious as the other. According to this philosopher, a man had three good friends in this world—the Koran, a horse, and a sword. There was no book like

* *A Journey to the Source of the River Oxus.* By Captain John Wood, Indian Navy. New Edition. Edited by his Son. London: John Murray. 1872.

the first. To a good horse a man was indebted for his livelihood and his wives, as, apparently, with it he could steal for the one, and run off with the other. And the sword was his title-deed. This worthy personage, on returning to his home, found that a favourite slave, whom he had some thoughts of taking to wife, had been sold by his brother, without, and indeed against, authority, for the sum of 17*l.*, and she was actually being carried off to the Bokhara slave market on horseback behind a burly stranger. We are left in some doubt whether the bereaved owner was more exasperated by the loss of his favourite, or by the reflection that the purchaser would be likely to sell her in Khurm for one-half more than he gave. In the neighbourhood of Jerm the author became acquainted with a specimen of the black-coated Kaffirs. These men possess great intelligence, lay no claim to a divine revelation, call themselves the brothers of Englishmen, and have been hunted down by the Mussulmans for the purposes of the slave market. In the Wakhan country a Kirghiz encampment was found: one hundred families lived in tents, made of coarse felt on a frame of willow-work, in the shape of a dome, and warmed inside by a Russian cauldron placed on an iron tripod. The tent was shared by the family with the young lambs of the flock, and outside were some 2,000 yaks, 4,000 sheep, 1,000 Bactrian camels, and a number of dogs as fierce as those we read of in the Odyssey. The young women of the tribe were good-looking; the males small in stature, ugly, and weather-beaten, and much given to swallowing pinches and even handfuls of snuff. These men buried their relations under tombstones decked with the horns of the wild sheep, possibly as a means of recognition when the snow drifted over the graves. They profess a preference for daughters to sons, obtain as much as 40*l.* for the marriage of the former, deck their wives with beads and ornaments of brass and oyster-shells, and pass them on, at the death of the husband, to the brothers and the next of kin. The food of the different families and tribes with whom the adventurers put up, varied in quality and character. The Hazaras supped on barley-bread and half-frozen water; at Kunduz all ranks had two good meals a day, of wheaten bread, pillaos of mutton, and soup, alternating with horseflesh which was expensive, and with pheasants which were delicacies. Tea was largely consumed, made in large iron pots, and enriched with clotted cream, with fat, and with salt instead of sugar. Game was abundant, especially during the winter, when birds were driven down into the valleys by the excessive cold. On the banks of the Koksha five hundred partridges were captured in a day's sport without firing a shot. Men and dogs lined the river and beat up the birds, which were pursued by mounted horsemen and literally run down. Pheasants were captured near Kunduz much on the same system, for at the second flight the birds appear to have surrendered, and to have been caught either by the dogs or the horsemen. Splendid specimens of the wild sheep were seen, and on one occasion eaten; but the real Russ, or 'Ovis Poli'—so named by Mr. Blyth after the Venetian traveller—was not seen alive. We do not find, as we might have expected, any speculations as to the dispersion of the lost tribes of Israel, which are often thought to have reached Turkestan and its vicinity; but, on the other hand, several chiefs stoutly affirmed their direct descent from Alexander the Great; and one vague tradition—scarcely appreciated by Wood—connects Solomon, or Suliman, with his usual Takht, or throne, on the top of a mountain overlooking a valley once thriving and populous, but now nearly deserted. But for details of these and other interesting topics, the mines of ruby and of lapis-lazuli, the table land of Pamir, and the lake from which the Oxus issues, sublime in its snowy desolation at a height above the sea level about equal to Mont Blanc, we must refer readers to the book itself.

Colonel Yule's careful and learned essay deals with subjects to which only the Royal Geographical Society can do justice; but we may just mention that he shows reasons for holding the main contributaries of the Oxus to be four, and not five in number, as stated by the Arab geographers; that the whole length of the Oxus is about 1,400 miles; that the extent of the Pamir plateau is about 180 miles; and that the principal lake, amongst a number half known and scarcely identified, ought to be called, for the present at least, Wood's Sir-i-kol, or Lake Victoria.

The republication of this work is a suggestive commentary on the vast changes which have passed over our Indian Empire since the mission of Burnes and his companions. At the time of Wood's exploration Runjit Sing was ruling at Lahore, and uttering clear-sighted and thoughtful prophecies about the inevitable spread of British power. Avitabile was striking terror into the Sikhs and Afghans by sanguinary punishments at which even Orientals were appalled. Dost Mahommed had not yet given up all hopes of securing the support and countenance of the East India Company or their Governor-General. Lord Lawrence was actively employed as a "rising official" on revenue and magisterial duties in the districts round Delhi. Lord Dalhousie had but lately left Christchurch. Lord Macaulay had just gained a notable triumph in the educational controversy over the infatuated adherents and supporters of Oriental classics, and was laying in philosophy and jurisprudence the broad foundations of his excellent Penal Code for India. Hindoos and Mahommedans had not yet begun to discourse glibly about national pledges and political rights; and the mind of the Sepoy, accustomed to a dazzling series of triumphs, had not deemed it possible that his comrades could ever be annihilated by the matchlocks of mountaineers in fair fighting, or that he himself could compete on his own soil for empire with the weapons of his own masters. After the lapse of more than a generation, after a series of events which might well fill a century, we are again brought face to face with Central Asian politics. And not the least suggestive portions of the book before us are those which, perhaps unintentionally, show the absurdity of expecting large commercial results from Central Asian traffic, which depict the difficulties of the country and the climate, and which disclose the willingness of the inhabitants to treat as friends and allies those who do not conceal aggression under the veil of a civilizing mission or a reciprocal trade.

GRANT'S HISTORY OF THE NEWSPAPER PRESS.—VOL. III.*

MR. GRANT at first imagined that he could put his *History of the Newspaper Press* into a couple of volumes. He has just published what he calls a "third and concluding volume"; but this, whatever it may conclude, is apparently very far from being the conclusion of the work. There are to be more last words, and a series of concluding volumes, one of which is, it seems, to be devoted entirely to ourselves. We are deeply sensible of the honour which Mr. Grant intends for us; but unfortunately we cannot show our gratitude by speaking well of the volume before us, or qualifying in any way the opinion we felt bound to express as to the first part of the work. Mr. Grant thinks it necessary in his preface to offer a few words of explanation as to the plan on which he has written his History. He has acted, he tells us, on the principle of devoting the greatest amount of space to journals "whose history has been marked by interesting incidents." Mr. Grant, however, has very peculiar notions as to the sort of incidents which fairly come within the scope of history. Everybody but Mr. Grant understands that, although we may make free with the private life of people who lived a long while ago, we are not exactly entitled to take similar liberties with the private affairs of our contemporaries. We may discuss Shakspeare's relations with Anne Hathaway, or speculate as to whether he made a good thing of his theatre, as much as we please; but the conjugal circumstances and professional gains of the managers or dramatists of our own day are not supposed to be legitimate subjects for public discussion. There is obviously the widest difference between writing the personal history of the old *Spectator* of Addison and Steele and the personal history of the *Spectator* of the present day; but nice distinctions of this kind are thrown away upon Mr. Grant. He is perfectly free and unrestrained in his inquiries into the most private circumstances of contemporary journalism. He tells us that one journal contrives to get a good many contributions without paying for them; that another is assisted by charitable contributions; that the proprietor of a third paper, a well-known politician who is mentioned by name, is not making so much out of the property as he once did. Mr. Grant is not, "he feels assured"—and the reader can have no difficulty in estimating the quality of the assurance—saying anything which the proprietors of another journal would have any objection to have made known when he says that they are "by no means pecuniary gainers" by the journal in question. He goes into a long story about a certain Protestant and Evangelical print, the owner of which "felt it due alike to himself and his readers to dispense with the services of his editor," and has since been fortunate enough to secure the services of another editor, of whom, for reasons best known to himself, Mr. Grant has an extremely high opinion. Some journals are doing very well, others are doing very badly; some are happy in the harmony of their family circle, others are less fortunate. Mr. Grant professes to know all about them. The contents of a newspaper are of course public property. Anybody who chooses can criticize them or comment on them. Every journal of mark has a distinct individuality about it, an individuality quite as distinct and pronounced as that of any public man, and there is no reason why this should not be analysed and described if any one thinks it worth while to do so. It is obvious, however, that the domestic arrangements of a newspaper concern only those persons who happen to be connected with it; and that other people have no more right to pry into these arrangements or to discuss them than they have to inquire what a neighbour has for dinner, or how he stands with his wine merchant, or whether he has been fortunate in his recent investments. Mr. Grant chose a subject on which an interesting and useful book might have been written. Other writers indeed had been before him, but the field was far from being exhausted. Unfortunately he has not the qualities necessary for the task, and he has also set to work in a false direction. His book, where it goes over ground already worked, furnishes nothing new except his own blunders and bad grammar; in other respects it is an impertinence. The three bulky volumes are made up for the most part of slovenly and inaccurate compilation, ungrammatical twaddle, and unmannerly and ridiculous gossip. It is deplorable that Mr. Grant should not only persist in his offence, but should apparently be incapable of even comprehending why it should be considered an offence at all.

Mr. Grant in the preface to the present volume makes "a passing reference to the fact that, in reviewing the previous two volumes,

---

* *The Metropolitan, Weekly, and Provincial Press.* By James Grant, Author of "Random Recollections," "The Great Metropolis," &c. Third and Concluding Volume of the "History of the Newspaper Press." London: Routledge & Sons.

certain critics professed to have discovered some inaccuracies in them." He observes that it is impossible to write a work of this description, "in which a number of facts"—what he calls "facts"—"are dealt with in every page without occasionally falling into error"; and we are quite ready to admit the force of the remark. It scarcely requires to be pointed out that there are difficulties in the way of writing the personal history of anonymous journalism. It may be assumed that journalists who do not of their own accord publish their names do not seek publicity; and as the information which Mr. Grant thinks it necessary to print cannot be obtained from any authentic or authoritative source, he is necessarily reduced to make the most of whatever vague rumours or loose gossip may happen to reach him. Mr. Grant is not ashamed to retail as "history" the tattle of printers' devils and the confidences of newsvendors' boys. Our historian is very fond of talking about "my certain knowledge," "my personal knowledge," my "individual knowledge." "I speak," he says, "from certain knowledge when I say that chiefly, though not solely, from this source"—that is, money extorted under threat of slander—"Mr. Westmacott of the *Age*, and Mr. Bernard Gregory of the *Satirist*, were making an income of from five to six thousand a year." Again, he says, "It consists with my personal knowledge that in the great majority of cases, especially in those of ladies, scandals damaging in some cases, and in others destructive to character, even where the imputations were wholly without foundation, were furnished anonymously by the professed friends of the persons whom it was sought publicly to slander." Unless Mr. Grant was himself on the staff of either of the infamous prints of which he speaks, or was in the habit of sending anonymous libels to them for publication, it is difficult to see how he could have any "certain knowledge" or "personal knowledge" on the subject. In the earlier part of this work Mr. Grant told a story, of course on the best authority, of the Duke of Newcastle, grandfather of the present Duke, calling on Dr. Giffard, and leaving a sealed packet for him, which, on being opened, was found to contain 1,200*l.* in bank-notes, with a letter of thanks for an article upholding Protestant principles which had just appeared in the *Standard*. It was added that Dr. Giffard applied the money, not to his own purposes, but to the support of the Protestant cause. Mr. Grant has since been informed by the Doctor's son, who was entirely in his father's confidence, that the story is pure fable, and that no such packet was ever delivered. Another of the ridiculous stories which Mr. Grant published referred to a dramatic criticism which the late Lord Campbell was said to have written when a reporter on the *Morning Chronicle*, and in which *Romeo and Juliet* was treated as a new play. Mr. Hardcastle, Lord Campbell's son-in-law, having examined the file of the *Morning Chronicle*, was able to state that no such criticism ever appeared in that journal during the time when Lord Campbell was connected with it. Mr. Grant, instead of simply apologizing for having published an idle and impertinent story without having made any attempt to verify it, wrote a long letter, in which he criticized, "first, the matter, and then the manner," of Mr. Hardcastle's brief and succinct statement, and wound up by saying that "the mistake must have been committed by some one else on the *Chronicle*, and erroneously attributed to Lord Campbell;" the fact being apparently that no such notice ever appeared, and Mr. Grant having certainly no evidence of the "fact" to offer. Nor is Mr. Grant satisfied with Mr. Disraeli's assurance that he never edited, or was paid for contributing to, any newspaper. Mr. Grant attempts to justify his original assertion by citing other statements in regard to Mr. Disraeli which do not in the least affect the question between himself and that gentleman, and he urges that "it is due to the right honourable gentleman himself, in order to his being set right with the public, that he should furnish the world with some further information on this point." It is difficult to say whether Mr. Grant's credulity or incredulity is more remarkable. It is surprising that an historian on the look-out for "interesting incidents" should have omitted to notice the curious Greek legend bearing on an interesting passage in ancient Jewish history, which a morning journal published, with learned comments, a few years ago. The omission is the more remarkable since Mr. Grant, as we learn from his History, was about that time editor of the journal in question.

We cannot of course pretend to check Mr. Grant's statements as to the private affairs of our contemporaries, but when we meet him on other ground his blundering is seen to be glaring and persistent. He speaks of the *Anti-Jacobin* without mentioning Frere. He says Gifford's "Baviad" was published in 1794 and the "Mæviad" in the following year; whereas the "Baviad" was published in 1791 and the "Mæviad" in 1794. He quotes Canning's lines on the death of his son, and in almost every line there are blunders which reveal his utter ignorance of rhythm and punctuation, and his inability even to copy out a few sentences from a book correctly. "Mr. Bagshawe, the late Mr. Wilson's son-in-law," is, he says, the proprietor of a well-known financial journal. Whoever may be the proprietor of the journal in question is no business of ours, but it is known at least that the name of Mr. Wilson's son-in-law is Bagehot, not Bagshawe. Mr. Grant informs us that Mr. J. R. M'Culloch's "talents have secured for him a highly remunerative Government situation," but Mr. M'Culloch's friends are still under the impression that he died some years ago. One of the weekly papers which rank highest in Mr. Grant's estimation appears to be *Reynolds's Newspaper*. It is interesting to hear that Mr. Reynolds is "a man of family, was educated at one of our great Universities, and is in his manners a perfect gentleman." Mr. Grant does indeed wish that Mr. Reynolds's "theological and political opinions were the very opposite of what they are"; but "it is due to his newspaper to state that, though it would, if it could, overthrow the Throne to-morrow, it is otherwise an excellent journal." It contains, we are assured, many "attractive features." We do not know whether Mr. Grant is disposed to reckon among the attractive features the carefully collected garbage of the week, the full reports of dirty cases, including occasionally special reports of loathsome evidence which the most shameless of the morning journals shrink from printing, and the filthy advertisements of quack doctors, abortionists, and dealers in indecent pictures, with which this "most readable of the penny weeklies" adorns its columns. The only improvement which Mr. Grant is able to suggest in this nice print is that, "if Mr. Reynolds could only give his many myriads of readers a somewhat brighter looking paper, it would materially add to the pleasure with which they would peruse its varied contents."

The chapters relating to the provincial press appear to be little more than an embroidered version of Mr. Mitchell's unpretending and useful record. Of one journal Mr. Grant says, "It is published on Thursday. The price is 4*d.* I have not heard who is to be the new editor." And we could have wished that the whole work had been written in a similar style. In another case Mr. Grant works out an important arithmetical problem for the reader's benefit. "The price," he tells us, "of this paper is 2*d.*, being"—and now we come to his discovery—"a medium between 3*d.* and 1*d.*" Little touches of popular science in this style help to enliven "historical composition." Mr. Grant does some injustice to the interest of his book by not giving more typographical distinction to those passages which constitute its chief claim to be of historical value. "Next proceeding westwards, at a distance of thirty miles from Huntly, we come to the town of Elgin." This simple sentence, printed in ordinary type, nearly at the end of the volume, hardly prepares us for what is to follow. There are many people who know nothing more about Elgin than that it is a picturesque little town, with an old cathedral which used to be boastfully called the "Lanthorn of the North." But the modern fame of Elgin is now identified with a lanthorn of another kind. Mr. James Grant was born in Elgin. "It may be doubted," he says, "whether there is one journal in the United Kingdom which can boast of a more interesting history than the *Elgin Courant*, under its original name of the *Elgin Courier*." What makes this history so tremendously interesting is that the *Elgin Courier* was started, not only "in my native town," but by Mr. Grant and a relative. "When I mention this," he says, "the well-known remark of the highest of all authorities, that 'a prophet has no honour in his own country,' will no doubt occur to the reader." "The remark of the great Teacher," however, was not "intended as of universal application." It was meant to be "only true as a rule," and Mr. Grant appears to hint that though this rule may have held good in Nazareth and elsewhere, there was a remarkable exception to it in Elgin. In point of fact, however, Mr. Grant had at the outset "to bear up under the literally universal conviction, freely expressed by all classes of the community, that the enterprise was sure to be a signal and speedy failure." Perhaps the greatest difficulty arose from the fact that the paper was started "without anything deserving the name of monetary capital"; in short, Mr. Grant had "nothing on which to trade but character." After he left Elgin the paper drooped and died, and then the *Courant* was established in the place of the *Courier*. Mr. Grant also started a literary magazine in Elgin, and he feels sure he will be "acquitted of egotism" if he mentions an incident which brought him into connexion with Sir W. Scott. The *Edinburgh Weekly Journal* had spoken good-naturedly of the Elgin bantling, and Mr. Grant chose to assume that the notice must have been written by Scott himself; so he wrote to the latter on the subject, and received a polite assurance that the article was from another pen. Sir Walter added what, Mr. Grant assures us, was to him "more gratifying far than anything in the review," but he will not more particularly refer to the contents of the letter, lest he should be charged with vanity. We are sorry that Mr. Grant's modesty should do him an injustice, and we venture to hazard the conjecture that the addition which so delighted him was an assurance from the great Sir Walter that he was his most obedient humble servant. One genius could hardly recognize another in more eloquent or more expressive terms.

BUXTON'S NOTES OF THOUGHT.*

"THINK of the men and women you know," says Mr. Charles Buxton in this posthumous publication, "who could have dreamed *à priori* that Jenkins had all that acuteness of thought and power of delineating which comes out in his novel? Who would have guessed that Brown had it in him to be an impassioned orator?" And after another example or two to the same effect, he concludes, "We think we know others, because the unknown part of their nature is so absolutely out of our ken that we do not even think of its being there. But the more I study men, the more I see that we do but skim their surface." A captious critic might possibly allege that we are not so often startled by the discovery of brilliant qualities in unpretending persons as this passage seems to imply; but substantially it contains a very true observation, and one which has a certain significance in regard to

* *Notes of Thought.* By the late Charles Buxton. London: John Murray.

its author. Those who merely looked upon Mr. Buxton from the outside, who had only met him in the hunting-field or in the House of Commons, might easily have failed to understand how much genuine wisdom and intellectual power was concealed beneath a gentle and unobtrusive manner. He was one of the rare cases, as Mr. W. E. Forster observes, in which the gap left by a man's departure seems to be greater than the space which he filled when alive. The explanation is, in Mr. Forster's language, that he was "one of those the full measure of whose faculties was hardly available for himself, but was, as it were, a force in reserve to be used for others under the pressure of their wants, their sorrows, and their wrongs, and even their intellectual needs; for instance, his conversation was curiously helpful in its suggestiveness." In fact, Mr. Buxton, though full of keen interest in all the political and social questions of the day, and doing his best to play his part thoroughly in every relation of life, was not one of those people who succeed by treading on other men's toes, or by blowing their own trumpet. He was content with a comparatively subordinate position, and was a sympathizing and encouraging spectator rather than an active combatant in the struggles of the day. Such men hardly receive full justice during their lifetime, and it is only when we are regretting their loss that we perceive how serviceable they have really been in their own quiet fashion.

The book which now appears, and which was left nearly ready for publication, is introduced by a brief biographical sketch by Mr. Llewelyn Davies. Mr. Davies has done his duty, as it seems to us, with admirable delicacy and skill. He has brought into full relief the estimable qualities of Mr. Buxton's character, without putting forward any untenable pretensions. Born in 1822, Mr. Buxton became a partner, on leaving College, in the great brewery of Truman, Hanbury, Buxton, and Co. He wrote his father's life; he married the eldest daughter of Sir Henry Holland, and he was a member of the House of Commons from 1857 till his death in 1871. These are the main facts of a not very eventful, though a thoroughly honourable, life. He was a prosperous English gentleman, who met with as few trials as are generally encountered by a member of the favoured classes. He illustrates, therefore, as Mr. Davies remarks, the ripening of a generous character in continued sunshine, which is in its way a pleasant spectacle, though not so impressive as the development of fine qualities under the pressure of adversity. A representative of the strictest sect of the Evangelicals, he took a great pride in his descent from the men whose efforts abolished slavery and did much to raise the religious spirit of the country from the lethargy of the past century. Many men in a similar position have been provoked into reaction against the Puritanical strictness of their early education. But Mr. Buxton retained the substance of the Protestant teaching, though, as he grew up, he abandoned the dogmatic creed, of his infancy. The strong moral convictions remained with him, whilst the rigid framework of doctrine was dissolved by his sympathy with the principles of the Broad Church party. The hatred of every kind of cruelty or oppression which had animated his father in the assault upon West Indian slavery was regarded by him as a sacred legacy; and a touch of the old Quaker tendencies appears in his rather undiscriminating hatred for war. One of the last questions in which he took a prominent part was the Jamaica revolt. Naturally enough he did not satisfy either party. Though vigorously condemning the atrocities which he held to have been perpetrated, he quitted the Jamaica Committee on their resolution to prosecute Governor Eyre for murder. Whatever view may be taken of his wisdom in this respect, his conduct was thoroughly characteristic. He had neither the merits nor the defects of a good partisan. His intellectual tendencies are well illustrated by his *Ideas of the Day on Policy*, published in 1865. The strong point of the book was its extreme candour, and the obvious desire to look at every side of every question. Its weak point was the apparent absence of a power of detecting the leading principles by which questions should be decided. A candid man draws up a list of the pros and cons on any debated point, and decides that he will take that view which is supported by ten arguments as against nine on the other side. Such a process does not lead to very definite convictions; and a more truly comprehensive mind is required to reach the higher level from which the true relations of the various arguments can be efficiently grasped. When one party proposes to go due north, and another to go due west, it does not really follow that the true course is precisely north-west; but that is the conclusion which is apt to commend itself to a man more anxious to be candid than to be decided. A compromise, in short, is sometimes worse than either extreme; and Mr. Buxton's views seem frequently to move in "a strange diagonal" which is not definitely satisfactory to anybody. Candour and toleration, however, are qualities far too rare and too estimable to be underrated; and, when combined with a generous hatred for all that is distinctly vile, their value is not easily over-estimated. They fit a man to exercise a softening and ennobling influence upon politics, though not to be a leader in the struggle. And it is to be hoped that we may always have a supply of public men animated by the spirit of Mr. Buxton. We are far more likely to run short of them than of zealous partisans, who could often be more easily missed.

To these more public virtues Mr. Buxton added many qualities calculated to endear him to his dependents and to his private friends. Mr. Davies speaks from personal knowledge of his well-judged efforts to improve the condition of the poor in London. He made it a special hobby to encourage the spread of free libraries, and offered to add to any subscription raised for that purpose as much more to be expended in the purchase of books. In one year, Mr. Davies tells us, in which a memorandum of his expenditure has been preserved, more than a third had been given away. His kindness to friends in his own rank was delicate and persevering; and love of animals, including horses, dogs, cockatoos, and snakes, is pleasantly significant of an affectionate disposition. His efforts to naturalize cockatoos at Fox Warren were unfortunately neutralized by the deeply rooted conviction of the British public that the final cause of the existence of all strange birds is that they may be shot. In a pleasant little anecdote we are told that Mr. Buxton was one day riding past a farm where a sheep-dog was tied up and howling piteously. He instantly begged his companion to stop and got off his horse to speak "a few sentences of pity and encouragement to the poor captive." His sympathy with snakes was equally creditable to his kindliness, but perhaps rather less agreeable to his friends. As an enthusiastic sportsman, he of course did not allow his love of wild animals to interfere with the pleasures of horses and hounds. To these amiable qualities we may add that Mr. Buxton had a keen love of architecture, and won the sixth prize in the competition of designs for public offices in 1856. Indeed his love of art and of poetry is shown by many symptoms in this volume to have been far more developed than we should have anticipated. Some of his descriptions of nature are very striking, and a very spirited hunting song, the only composition, as it seems, in verse which he ever produced, is the more remarkable as it was written in a dark room whilst he was suffering from concussion of the brain. We quote a stanza by way of specimen:—

> How soft lies the valley asleep below,
> In the golden sunshine, as on we go,
> Down the long sweep of the hillside bare,
> Drinking sweet draughts of the vernal air!
> The lark is raining his music down,
> The partridge whirs up from the grasstuft brown.

We have lingered so long with the author that we have not much space in which to speak of his book. The book, however, derives much of its interest from the unconscious indications of its author's character. It consists of a series of reflections, written down apparently as they presented themselves, on a variety of subjects, religious, social, or political. In all such books there are of course a good many comparative failures. Nobody could put together nearly seven hundred reflections on all manner of subjects without frequently sinking into platitude or becoming occasionally trifling. To describe so miscellaneous a collection is far from easy. From its nature, there is not much unity except that which is derived from the family likeness of the various thoughts. They all, as may be supposed, indicate a generous, observant, and contemplative mind, with occasionally an agreeable dash of humour. The speculation, though it frequently turns upon such awful subjects as the origin of evil, does not show any great metaphysical acuteness, and the humour might perhaps be better described by the milder name of playfulness. Here, however, is a pretty good specimen, which need not have been disowned by Sydney Smith. "Would it not be happy for all parties," says Mr. Buxton, "if idiots and old people when grown imbecile could be comfortably shot? I would have it done with the utmost decorum; perhaps by the bishop of the diocese. But what an unspeakable relief!" Here are a couple of specimens, which in a brief space illustrate the quaint turn of thought that sometimes gives freshness to an old remark:—"Proverbs are potted wisdom." The other is better and more original:—"The years of life seem like the hops of a 'duck and drake' on a pond—the first much the longest." As a general rule, the remarks upon life are of an optimist, perhaps too optimist, tendency. We are willing to believe the writer when he says that "every year more varied and intimate intercourse with my countrymen and countrywomen makes me more deeply sensible of the prodigious amount of goodness of head and heart amongst them"; for the impression depends as much upon the recipient as upon the object. But we have a little difficulty in sympathizing with the remark—"'Tis amazing to find out what hosts there are of delightful people"—unless delightful be taken ironically. However, the optimism is never offensive, for it is accompanied by true tenderness and thoughtfulness, and occasionally counterbalanced by a shrewd hit at the foibles of various classes. We will conclude by quoting one reflection of moderate length, which is a favourable specimen of style and sentiment, though there are many equally good:—

> It sometimes strikes me as the strangest thing in the world to hear this man or that spoken of with absolute contempt when, after all, *what* is this being who is thus set down at two minutes' notice? What a boundless ocean of thoughts and images has flowed through his mind since the day he was born! What millions of feelings have swayed his heart! What a vast variety of incidents have made up his career! What countless good traits there are in his nature! What a future lies before him! What a sphere of action around him! Is this infinite, complex, unutterable, inconceivable being to be sneered down because he is ill dressed or has clumsy manners?

With so much that is kindly, wise, and tolerant, and so much sympathy with the vast masses of suffering around us, as is indicated in many pages of the book, it would be ungracious, even if we had space or inclination, to find fault with some of the theories suggested. Where there is any shortcoming, it is generally on the side of over-tenderness to human nature or to popular beliefs, and we may therefore admit the faults without any diminution in our regard for the author. The book well deserves to be popular, if only as showing how excellent a life may be led in spite of the disadvantage of almost unmixed prosperity and domestic comfort.

If Mr. Buxton was not a great man, he was one whose memory should be warmly cherished by all who were in any way connected with him.

HAZARD'S SANTO DOMINGO AND HAYTI.*

THAT St. Domingo, with its superior advantages of position, climate, and natural resources, should for so long have yielded to Cuba the crown as titular Queen of the Antilles, has at all times been more or less a problem. When Columbus, in his first voyage, in December 1492, traversing the narrow strait which separates the two islands, came in sight of her shores, he declared his new discovery to be even more beautiful in his eyes than Cuba, on which he had already almost exhausted the language of panegyric. In token of its superiority in every natural endowment he founded on the northern shore the first settlement of the New World, and the nucleus of the whole civilization of the Western Continent, giving to the island the name of Hispaniola, or Little Spain, imagining it to resemble the most favoured province of Andalusia. Beautiful, naturally favoured, and fertile as ever, the island has remained with but little intermission unto this day poor, undeveloped, a prey to foreign violence or internecine strife. The question having arisen within the last few years in the United States as to the incorporation of St. Domingo into the Union, a Commission was sent over by the American Government to investigate and report upon the resources and prospects of the island. Mr. Samuel Hazard, who had already undertaken a somewhat similar inquiry on account of an influential American journal, and who had previously won for himself credit by his Report upon Cuba, took the opportunity of associating himself with this official mission. After almost entirely circumnavigating the island, and traversing its length and breadth, he was amazed to find so magnificent a part of the New World so generally uncultivated, and even uncivilized. His curiosity was stirred to know what causes besides the reputed one of climate could be alleged for the backwardness and beggary of a settlement intrinsically so valuable and attractive. Coming with this view to London, he set himself to hunt up the materials for a solution of the problem amongst the treasures of the British Museum; with what assiduity may be judged from the list of some two hundred writers of more or less note which he has prefixed to his lately published volume. Believing correctly that little of the past history of the island, especially of the Spanish part, is known to the public at large, he brings his ample reading to elucidate the causes of the existing condition of St. Domingo and Hayti; arising as it does from the fact of the island having been successively the battle-ground of Spaniards and Indians, the buccaneers, the English, French, and Spaniards, and, finally, from the internecine strife and revolutionary frenzy of Haytians and Dominicans themselves.

The whole island was at the time of its discovery known to the natives as Haiti, or "the high ground," the eastern portion having the name of Quisqueya, or "mother of the earth," and the western that of Babeque, or Bohio, "land of many villages or habitations." It was divided into five main provinces, each under a cacique, the government being, as among the aborigines of the West in general, mildly despotic and hereditary: with the provision that if a cacique died childless, his estates and rights passed to his sisters rather than to his brothers, greater purity of blood it was thought being thus secured. One race and one language, with minor variations, seem to have prevailed throughout. It was at the north-west angle that Columbus first touched land, calling it by the name of St. Nicholas, whose day it was. His earliest fort or settlement, La Navidad, in the Bay of Aicul, was found by him destroyed, with the settlers he had left behind, when on his second voyage he landed in Samana Bay, November 22, 1493. He had in the meantime returned home with the news of the discovery of the gold regions of Cibao. His new settlement, Isabella, further to the east, now became the corner-stone of enterprise and conquest, and the model of all Spanish establishments in the New World. Here from the year 1636 was his own resting-place, until in 1795 his remains were transferred from the ruins of the long-deserted city to the Havana. It was at New Isabella, afterwards known as the city of Santo Domingo, that he ultimately set up the seat of government, laying the first stone on the 4th of August, 1496. Mr. Hazard in one of his woodcuts shows us the citadel in a cell of which the great Admiral with his brother Bartholomew was shut up by the infamous Bobadilla in the year 1500; the rest of the town having been two years later destroyed by the famous storm in vain foretold by Columbus, and rebuilt by the new Governor, Ovando. Columbus, on his third visit in the autumn of 1498, embarrassed by the successful mutiny of Roldan, found himself compelled to give in to the system of *repartimientos*, or allotments of land with native labourers to work them, which was destined to be the fruitful source of quarrels amongst the Spaniards and of misery to the aborigines. Under the ruthless Ovando, whose uncompromising rule was all in all to the Spanish settlers, at the expense of the down-trodden and miserable natives for whom Queen Isabella vainly interfered with enactments of protection and humanity, the island was forced to a temporary pitch of prosperity. The death of the Queen in 1504 hastened a crisis. Ferdinand's orders for bettering the condition of the Indians, in memory of their protectress, provoked measures of severer treatment and oppression. Weak and indolent by nature, the natives sank under the strain of labour. What De Bry describes as a saturnalia of suicide, figured in a graphic woodcut from Benzoni's History, set in to accelerate the natural decay of population, and the million of aborigines estimated by Columbus to have held the island at the date of its discovery had in fifteen years dwindled to no more than 60,000. To supply the deficiency of labour, Ovando, with the consent of Ferdinand, introduced natives from the Luycayos Islands, or Bahamas, to the number, it is said, of 40,000. Under his successor, Diego Columbus, the *repartimiento* system, opposed as it was by the Dominican priesthood, especially by Las Casas, was pushed to a degree which amounted to unmitigated slavery, favoured by the famous edict won from Ferdinand by the Franciscans, declaring it a divine and humane duty to hold the Indians in servitude, as thus they might become Christians. The return made by Albuquerque, who was charged with portioning out the natives, shows a falling off in 1514 to 14,000 souls. The blame of introducing African slaves has been often unjustly thrown upon Las Casas; but negroes had been as early as 1511 brought into the island under regulations approved by the Spanish King, which were further defined by Cardinal Ximenes during the minority of Charles V., under the influence of the Dominican friars, who thought thereby to lighten the lot of the aboriginal Indians. The introduction of the sugar-cane from the Canaries in 1506 had been the main cause of the stress of labour, as it now became the spring of wealth to the Spanish colonists. The patent of Charles V. to a Flemish favourite for the importation of 4,000 Africans yearly being sold to some Genoese for 25,000 ducats, an organized slave-trade was now set up, and in 1522 the blacks felt themselves strong enough for a temporary rising. A last attempt of the aborigines under Enrique so far prevailed as to secure in 1533 for the slender remnant of their body, 600 in number, an independent village settlement at Boya, where the last of the pure Haytian race ere long became extinct.

From the zenith of its short-lived prosperity the island was soon brought low by the ill government of the Spanish *audiencia*, the depredations of Drake and the buccaneers, and the intrusion of the French upon the west coast, which, after many a doubtful struggle and unsparing slaughter on either side, was confirmed by the peace of Ryswick. With the rise of French culture and trade the Spanish settlement sank, till in 1730 the entire population was no more than 6,000, St. Domingo city having but 500 inhabitants. Tobacco had been introduced some time before this with great success by the French, followed by indigo and by a revival of the growth of sugar. The cocoa-tree, introduced by D'Ogeron in 1665, yielded a considerable revenue, as did also the coffee plant, brought in from Martinique. The boundary line between the French and Spanish districts was at length strictly defined in 1779, by which time the Spanish population had shared somewhat in the prosperity of their rivals, their milder slave laws attracting many fugitives from the French side, who, purchasing their freedom, added to the well-to-do classes. Shortly before the French Revolution, though we get no corresponding statistics of the population or wealth of the Spanish portion, there were in the French colony, as we learn from Mr. Hazard's figures, 14,000 white inhabitants, 4,000 free mulattoes, and 172,000 negroes. The products exported from the island were of the value of 6,250,000 dollars, and the imports 8,887,500 dollars. The French, who yet at no time professed to give much attention to cattle or stock raising, had 63,000 horses and mules, and 93,000 head of horned cattle.

The popular idea of the terrible revolution of St. Domingo as a mere wild uprising of the blacks against the cruel tyranny of their masters is set right by Mr. Hazard. The whole transaction divides itself into three epochs. First came the revolution of the whites. The ferment of the great Revolution at home, rapidly extending to the colony, raised among the creoles, or white citizens of native birth, the ambition of independence. The Assembly of St. Mark, growing out of the three provincial Assemblies, declared itself in 1790 the supreme governing body, denying to the mulattoes the rights of liberty and equality decreed to them by the mother-country. The second phase of the revolution was a temporary rising of the mulattoes, aided by a party among the "small whites," which was quelled by the Assembly. Roused once more by the arrival of the decree from France conferring freedom upon all people of colour, the mulatto population now went mad with delight, the whites of the Assembly being openly confirmed in their rebellion against the home Government. Amidst the confusion ensued the third and most fearful revolt, that of the blacks under François. Checked for awhile by the whites, who wreaked indiscriminate cruelty upon blacks and mulattoes, the negro rebellion swept through the land in a torrent of flame, lust, and blood, the blacks parading as "King's people" under the banner of St. Louis, and instigated, Mr. Hazard gives authority for believing, by Spanish influence. The patriotic party, on the other hand sought, and to some extent secured, assistance from Lord Effingham, Governor of Jamaica. The outbreak of war between England and France in 1793 led to strenuous efforts on our part to occupy the whole island jointly with the Spaniards, until the withdrawal of General Maitland in 1798, the Spanish force having three years before evacuated the island under treaty with the French. By this time the growing influence of Toussaint, who, from serving in the first instance on the Spanish side, had been induced to go over to the French, judging the interests of the negroes to be safer under a Republic,

* *Santo Domingo, Past and Present; with a Glance at Hayti.* By Samuel Hazard, Author of "Cuba with Pen and Pencil." With Maps and Illustrations. London: Sampson Low & Co. 1873.

led to all power passing into his hands, the independence of Hayti being proclaimed in 1801, and a Constitution promulgated for the whole island under Toussaint as supreme Governor.

With no less firm a hand does Mr. Hazard hold the clue through the later labyrinth of anarchy and change out of which the island at length emerges into the light of current history. So shifting is the course of intermediate event—the fortunes of the French and Spanish portions, like uprooted trees whirling in a flood, now interlocking with each other, now again starting asunder for another eddy of change—that we are glad to get here and there some definite points, like the proclamation of the Republic of Boyer at the beginning of 1822 over the entire island, and that of the separate Republic of St. Domingo, February 27, 1844, where we can stop and take breath for a further plunge into the maelstrom of Haytian politics. In a special chapter we get a clear outline of what has been since going on in the independent Dominican Republic, of the reversion under Santana to Spanish rule in May 1861, after abortive efforts at annexation, first to the United States and next to France, the struggles under Cabral and Cabrera, and the final declaration of freedom by act of the Cortes, March 3, 1865. From that date much has been done under the now ruling President Baez towards effacing the signs of ruin and desolation which still bespeak the "time of the Spaniards." The result of Mr. Hazard's systematic and agreeably told survey of the whole region under Dominican rule is to satisfy him of the unbounded capabilities of the soil, and of the progress which would certainly be made by its people were good order, peace, and enlightenment but secured them. This happy consummation, he is confident, awaits the island from the project of annexation, ardently desired as he declares it to be by the respectable citizens of all classes, and strongly as it is urged in the formal Report of the United States Commission. The narrative of his tour is graphic and often picturesque. He has at once a quick eye for the beauties of nature, which are nowhere displayed with more richness or variety than in this fair tropical island, and an appreciation of native character which brings amusingly into light the moral traits and social condition of the people. Of the sister or rival Republic of Hayti he has no such brilliant or hopeful picture to give, though he admits that the justice of his portraiture may be challenged by loyal Haytians. Though scarcely, if at all, less favoured by nature, the French quarter of the island has had far less breathing-time from anarchy, strife, and wretched government. Since the burlesque episode of the so-called Empire under Soulouque, Hayti has had to endure the gross and vulgar tyranny of titular Presidents like Geffrard and Salnave. Although the existing state of things under Saget is in every way more respectable, it is still no other than a military despotism tempered by occasional *émeutes*—passes being required by country people coming to town, and soldiers forming the only police. Yet for this unsettled region, ruined and depressed as it is, our author sees hope in prospect from the absorption of the entire island under the rule of the Northern Republic. His book, compiled with praiseworthy care, and showing throughout more than common powers of observation and judgment, may probably enlist converts in both countries to the policy of union.

FOR LIBERTY'S SAKE.*

NO one would guess the nature of this book from its title. It is another of the great class of "rehabilitations." Mr. Marsh, who it seems from his title-page has written several other books, "*The Story of Harecourt, Venice and the Venetians*, &c., &c., &c.," has here undertaken to whitewash the well-known Robert Ferguson, whose name is familiar to every reader of Macaulay. We think it is quite possible that Ferguson might be "rehabilitated," but Mr. Marsh has hardly set about the work in the most promising way. An historical discussion is one thing; a story is another. We are very far from condemning the historical novel in the abstract, but the best historical novel cannot prove anything. It can at most only give a truer impression of things by means of a clear and powerful picture; it can never of itself supply arguments or answer objections. The way to prove Robert Ferguson to have been a good man, or a less bad man than he is commonly thought to have been, would have been to deal with Ferguson as Mr. Christie has dealt with Ferguson's more dignified ally, Shaftesbury. Mr. Christie calls on us to think better of Shaftesbury than we have been wont to do, and he gives us in proper form all the materials for either accepting or rejecting his view. And it should be noticed that Mr. Christie has himself incidentally done something towards asking for a more favourable opinion of Ferguson. Lord Macaulay, as every one knows, draws Ferguson in the darkest colours, but we instinctively take off something from any of Lord Macaulay's elaborate portraits. Mr. Christie brings Ferguson in as "a Scotch clergyman and friend of Shaftesbury whom Dryden has scurrilously maligned." He says in a note that "Dryden's abuse of a rebel is no authority," and adds, "I have seen intercepted letters of Ferguson in the State Paper Office which give a favourable idea of his character." Mr. Marsh seems to have lighted on the same letters, which he did "while searching in the State Paper Office for documents relating to another person." These letters, which were written by Ferguson to his wife, but most of which never reached her, do certainly, as Mr. Christie says, speak well in behalf of the writer; but it does not need any very deep research, either historical or philosophical, to understand that a man may be a good husband and father and so forth, and yet may be in public matters a scoundrel, though perhaps hardly so great a scoundrel as Lord Macaulay makes him out. Lord Macaulay's own pages set before us the picture of Lord Treasurer Rochester taking a chief part in one of the basest of intrigues, and then withdrawing to his closet to pour out his soul in one of the most devout of meditations. So far both Mr. Christie and Mr. Marsh, though they make us begin to doubt—what, however, we should to some extent have doubted in any case—the perfect truthfulness of Lord Macaulay's picture, do not make us altogether throw it aside. But now comes the strange way in which Mr. Marsh sets about the task which he has taken in hand. "The letters," he tells us, "appeared to me to furnish such an interesting insight into the domestic relations of one of the most celebrated men of the age that I determined to use them as the groundwork of this story." From any point of view it seems odd to call Ferguson one of the most celebrated men of the age; but the letters are quite worth preserving, though it is an odd way of treating them to write a story of which some at least of the lesser actors and incidents are plainly fictitious, and to work in the letters in their places. But it is much more amazing when we go on to read:—

> There is also in the same Office a closely written MS., relating to the Rye House Plot, sufficient to fill five columns of the *Times*, in the handwriting of Ferguson, which supplies facts relating to that conspiracy that have never been brought before the world. Taking that MS., and the letters, a complete account was furnished of events by an active partisan, in the most interesting period of English history, from 1682 to 1688. The explanation they give of the part taken by Ferguson in the Rye House Plot is quite natural; and one that better consorts with his character than that attributed to him by every writer up to the present time.

The last words are hardly fair after the notice of Mr. Christie, short as it is; but why on earth did not Mr. Marsh print the narrative about the Rye House Plot at length, instead of grounding a story upon it and giving a single short extract in an appendix? We take Mr. Ferguson's word for it that the letters which he prints in the name of Ferguson, and two short letters which he prints in the name of Jeffreys, are all of them genuine. That Jeffreys's letters are genuine we argue from a small point. The first, in 1683, is signed "Geo. Jeffreys"; the second, in 1685, is signed "Jeffreys." He had really been made a peer in the meanwhile; but we feel sure that, if the letters were Mr. Marsh's own invention, he would not have attended to accuracy on this point. For he throughout—everywhere, we think, except in one place—uses the vulgarism of "Lord William Russell" when he means the eldest son of the Earl of Bedford. Yet it would have been much better soberly to print the letters as materials for history than to work them in this way into a story which, as a story, is not particularly interesting. But, when it comes to a man's own narrative of an historical event in which he was concerned, it is really too bad to treat it in this way. As the matter stands, we have no means of judging how much of the story really comes from Ferguson's own manuscript and how much is due to Mr. Marsh's own imagination. We decline to give any judgment or opinion one way or the other till we have seen real materials for forming a judgment.

As a tale, there is really not much to say about the book. We have read it through with a slight effort. There is so far more to be said for it than for those stories in which one breaks down in the first chapter. But it is not in any sense a novel or romance. It has no particular plot. It is simply a life of Ferguson, or rather a narrative of the greater part of the life of Ferguson, touched up with imaginary details. Power of narrative or of painting there is none. But the imaginary parts are all likely enough; though, for private reasons of our own, we wish to know whether Sir Robert Rich of Navestock is an historical personage, and, if so, why he should be called Sir Robert in one place and Sir Peter in another. Moreover it seems that Ferguson, when a bookseller, had a handmaiden named Moll who was not discreet; at least Ferguson counsels his wife to get one who was "discreeter." He had also "two men in the shop," both of whom were "young, and therefore not likely to be very discreet," and one of whom was "represented under no encouraging character." Moll and the idle apprentice go through a number of adventures, public and private, but none of them to their credit. One of them is a very odd ceremony of being married over the carcase of a horse, for which we dare say Mr. Marsh has contemporary authority, though we should like to know what it is. But the idle apprentice turns out to be no other than a natural son of Jeffreys, on the strength of which he and Moll were only transported to New England, when he might have been embowelled and she burned for the treasonable act of coining. We may add that the idle apprentice bears throughout the story the name of Saturday Jack. For Man Friday, all the world knows, there is a precedent in the writings of Ferguson's age; but as Saturday Jack stands quite alone, at least in our knowledge, we look on the choice of this particular day of the week as really getting personal.

Of history proper, Mr. Marsh certainly makes rather short work. Ferguson, as every one knows, accompanied first Monmouth and then William in their several landings. On the second occasion he appears at Exeter. While Burnet was preaching in the cathedral before the Prince, Ferguson, as the readers of Lord Macaulay know, preached elsewhere. In Lord Macaulay's narrative the story runs thus:—

> At the same time a singular event happened in a humbler place of worship.

For Liberty's Sake. By John B. Marsh. London: Strahan & Co. 1873.

Ferguson resolved to preach at the Presbyterian meeting-house. The ministers and elders would not consent; but the turbulent and half-witted knave, fancying that the times of Fleetwood and Harrison were come again, forced the door, went through the congregation sword in hand, mounted the pulpit, and there poured forth a fiery invective against the King. The time for such follies had gone by; and this exhibition excited nothing but derision and disgust.

Surely, in a story founded on the life of Ferguson, such a scene as this should be made the most of. Fancy what Scott would have made of it. But in Mr. Marsh's hands it is tamed down as follows:—

Ferguson was one of those on board the convoy. The same day that Bishop Burnet celebrated Divine service in the Cathedral at Exeter, he took forcible possession of the largest dissenting building in the town, and preached to a crowded congregation.

Then comes a wonderfully short account of all that took place in the later months of 1688 and the earlier months of 1689. We had always thought that there had been something like a campaign, though certainly not a very bloody one—that at least there had been some marching to and fro of soldiers, and still more in the way of gatherings and debates (though we suppose the lawyers will not let us call them Parliamentary), before anybody ventured to speak of the Prince of Orange as King. But, according to Mr. Marsh, everything was settled very quickly and quietly:—

Onwards marched the army, the line of route partaking more of the characteristics of a triumphal procession than the progress of a conquering host. As the people looked upon the face of the Prince of Orange, they shouted "Long live the good King William!" and the salutation was everywhere repeated. The Coronation, which afterwards took place in Westminster Abbey, was only necessary as a matter of form; he had been crowned King by universal acclamation months before.

The last few pages are the queerest, for here Mr. Marsh has to grapple with the great difficulty that Ferguson, after accompanying William and receiving a rich sinecure office from William, plotted with those who strove to restore James. The fact is undoubted, and it is, to say the least, awkward for any one who wishes to make a hero or a martyr out of Ferguson. Lord Macaulay goes into the philosophy of the matter. According to him, "sedition, from being Ferguson's business, had become his pleasure. It was as impossible for him to live without doing mischief as for an old dram-drinker, or an old opium-eater, to live without the daily dose of poison." And again, after half a page of graphic portraiture, "his hostility was not to Popery or to Protestantism, to monarchical or to republican government, to the House of Stuart or to the House of Nassau, but to whatever was at the time established." As usual, we allow a little for colouring, but Mr. Marsh's explanation seems to us the harder to believe of the two:—

But his mind was weakened by the sufferings he had endured; and his judgment, taking alarm at what he fancied was the inletting of Popery, betrayed him into a participation with the Jacobites against the King . . . . There is some ground for believing that direct overtures were made to him by James, and a pledge given of such a nature as would secure the maintenance of the rights and privileges of the English people and the security of the Protestant religion. He was led by these promises—and by a fear, shared in by many good men, that the excessive liberty granted by William to all classes of religionists would promote the growth of Popery—to ally himself with those who secretly sought to restore James to the throne.

Of all ways for stopping the growth of Popery, to turn out William and let in James would seem to be the strangest. If a man like Ferguson, who had sinned so deeply against James and had suffered so much from James, really came to put trust in James's promises, he must certainly have gone a long way towards losing his wits. There is however the fact that the same strange inconsistency has to be accounted for in men of much higher place than Ferguson. There is the case of Shrewsbury, to say nothing of that of Marlborough. It is not our business to make a moral dissection of all of them, and it has been pretty well done by Lord Macaulay; but the fact is at least an ugly one for the admirers of any of the party, and an intrigue with James would be hard to deal with at length in a tale which has Ferguson for its hero. Mr. Marsh therefore perhaps judges wisely in cutting the matter short.

Lastly, why the book should be called *For Liberty's Sake* we cannot make even the faintest guess.

IN THE DAYS OF MY YOUTH.*

MISS EDWARDS is certainly not wanting in courage. She writes the life not only of a man, but of a young man, a student of the Quartier Latin, and she writes it in the form of an autobiography. The hero, who tells his own story, is a young Englishman who has been sent over to Paris to study medicine under an eminent French doctor. His life is doubtless far more respectable than that of most students of that quarter, but he occasionally gets drunk, becomes acquainted with "the fair and frail grisette"—that "necessary sequence" of the student, to use Miss Edwards's words—is fleeced by an *intriguante*, is taken into a private gambling-house, or rather "hell," helps in arresting an escaped *forçat*, and is second in a duel where a man is shot, besides joining in all the lively and reckless amusements of the Parisian students. Now it is difficult to conceive that Miss Edwards can have had any personal experience of these scenes and of these characters, which go so far to fill up her book. Clever though her story undoubtedly is, it must be the cleverness of one who copies a copy, not of one who draws straight from nature. Happily, though her hero is a medical student, she does not give him the least taste for medicine, and therefore we are spared medical details which, whether original or not, would have been highly disagreeable. She represents him as devoted to art. Now an author who can speak so authoritatively as Miss Edwards does of art must be aware that even in pictures a copy is no great thing, while in books it is as needless as it is worthless. Those who wish to study the Quartier Latin would surely do better to study it in the books of men who alone can know anything of it, or, at least, who alone can write of it with knowledge, till the day shall come when some "fair and frail grisette" shall arise who shall be as like Miss Austen in her power of accurately sketching life as she is unlike her in her life itself. Miss Edwards has doubtless read up her authorities carefully. She is familiar with Béranger, Balzac, and De Musset, and for all we know may have studied with equal care Paul de Kock. From them she may have formed some idea of a party given in the fifth story of a dingy house in the Quartier Latin, where the guests "were all students and grisettes." From them she must have got so enraptured with the grisette as to make her hero thus burst out into a "modest pæan in her praise":—

Vive la grisette! Shall I not follow many an illustrious example and sing my modest pæan in her praise? Frown not, august Britannia! Look not so severely askance upon my poor little heroine of the Quartier Latin! Thinkest thou because thou art so eminently virtuous that she who has many a serviceable virtue of her own, shall be debarred from her share in this world's cakes and ale?

Vive la grisette! Let us think and speak no evil of her. "Elle ne tient au vice que par un rayon, et s'en éloigne par les mille autres points de la circonférence sociale."

We do not ourselves profess to be able to follow Miss Edwards in her description of this form of Paris life, as our education unhappily stopped short of the Quartier Latin, and as "the grisette *pur sang* is to be found nowhere except in Paris, and—still a step further—nowhere in Paris save between the Pont Neuf and the Barrière d'Enfer." One thing, however, we know well. Whenever authors set about describing scenes which they can never themselves have seen—and when we assume that Miss Edwards has not seen what she describes we hope we do her no injustice—we may be sure of one thing. Whatever other merits the description has, it cannot be true to nature. It does not indeed follow that "who drives fat oxen must himself be fat," but it does follow that who describes the life of a harlot—and grisette, "a necessary sequence" of the student, is, we take it, the French for one kind of harlot—ought to have mixed with harlots. Miss Edwards, we are thankful to admit, injures the dramatic power of her story by omissions which would certainly not have occurred in Balzac. But though her story is thereby rendered more moral, yet it loses to the same degree in truthfulness. We could have wished, however, that she had omitted the following passage from her "modest pæan" in the praise of the grisette:—

Supposing even that she may now and then indulge (among friends) in a very modified cancan at the Chaumiere—what does that prove, except that her heels are as light as her heart, and that her early education has been somewhat neglected?

Supposing that for *cancan* we substitute its proper equivalent, "indecent dance"; must we not conclude that Miss Edwards is utterly ignorant of what she is writing about, or that her early education, like the grisette's, has been somewhat neglected? It is bad enough to have this shameless dance brought on to the English stage. It is bad enough for English gentlemen and ladies to sit gazing at women dancing for hire in such a way as no one could dance but those who danced either for hire or in hopes of hire. It is still worse, however, when an English authoress of fair repute, speaking in the person of her hero, upholds public indecent dancing, however "modified," and however much "among friends." "The Chaumière," we are told, "is no more; the grisette is fast dying out." We wish that Miss Edwards could have let her die out in silence, and could have spared us her "modest pæan."

Had this book been the work of a man, we should have had but little fault to find with it as regards its morality. If indeed Miss Edwards had left out the "modest pæan," while we should have equally in an artistic point of view blamed her for describing a life of which she could of herself know nothing, yet we should not have had to censure her with any severity. Let no one therefore on reading what we have said at once send for this novel from the circulating library, in the hope of finding a book which had much better be left unread. We must do Miss Edwards the justice to admit that what is worst in her book we have already quoted, and that, foolish and bad as is her praise of the grisette and her apology for the cancan, she is entirely free from those seductive scenes which are too often found in the pages of female writers. We hope that she will for the future make a better use of that cleverness which she undoubtedly has, and will not, in Horace Walpole's words, spend her time in making "true copies of original pictures that never existed." And yet as we have already implied, the copy is clever enough. With a few exceptions, the book is lively throughout till close upon the end, where the story is wound up in a scene that is so overdone in its melodramatic action that it deserves at once to be brought out on the London stage. It is curious, however, that a writer who has so keen a sense of the ridiculous as Miss Edwards evidently has should have been able, in revising her proofs, to leave in passages here and there which are as foolish as they are fine. We do not

* *In the Days of My Youth.* By Amelia B. Edwards, Author of "Barbara's History," &c. &c. 3 vols. London: Hurst & Blackett. 1873.

so much complain of her describing a gentleman as "infringing the Company's mandate by lighting a cigar"; but what shall we say of such a passage as the following:—

> Then our souls rise up within us, and chant a hymn of praise; and the great vault of heaven is as the roof of a mighty cathedral studded with mosaics of golden stars; and the night winds join in with the bass of their mighty organ-pipes; and the poplars rustle, like the leaves of the hymn-books in the hands of the congregation.

We should like to know how such fine writing as this would have been welcomed in the Quartier Latin, if the student had read it aloud to his necessary sequence, the fair and frail grisette. Down to the "mighty organ-pipes" it might possibly have passed for sense, but who could have stood the hymn-book-like poplars? A few pages further on we come to another comparison which no more than this last will go on all fours:—

> Alas! We cannot undo that foolish past. We may only hope to blot it out with after-records of high, and wise, and tender things. Thus it is that the young man's heart is like the precious palimpsest of old. He first of all defiles it with idle anacreontics in praise of love and wine; but, erasing these by-and-by with his own pious hand, he writes it over afresh with chronicles of a pure and holy passion, and dedicates it to the fair saint of all his orisons.

Now, if a palimpsest is precious, it is only precious as a palimpsest when the writing that is blotted out is more valuable than the after-records. No doubt in many a palimpsest, as in the young man's heart, the later writing alone has any worth, but then we do not call it a precious palimpsest.

These two passages occur at the very end of the last volume, when Miss Edwards thinks perhaps that she may be justified in bidding farewell to her ordinary good sense, and in giving the reins to her suppressed love of fine writing. We ought surely to allow a little freedom to an author who for nearly three volumes has kept sensible, and who, like a school-boy on the last day of the school term, a few hours before the right time, snatches at that license which will so soon be his. The inaccuracy of her metaphors is nothing, however, compared with the inaccuracy of her dates. We could greatly desire that all writers of stories, both men and women, should be required to pass an entrance examination in comparative chronology. We might, as they do in the History School at Oxford, make a division of periods, and allow each student to pass in whichever he chose. No one, however, should be allowed to write a story that was laid outside the period for which he had got his certificate. No doubt it is by a printer's slip that Miss Edwards is made to write of "the unfortunate son of Louis XIV. and Marie Antoinette." But it is by no slip that, shortly after "the Bourbons reigned again," she introduces "the route by Newhaven and Dieppe," the railways, the gentleman who "infringed the Company's mandate by lighting a cigar," and the use of photography "in every penal establishment throughout France." It is another blunder in history that leads her to lay her story in the days of the Restoration. Part of her plot is concerned with some estates in France which had belonged to a nobleman who had perished in the Revolution. His son had escaped, and, according to Miss Edwards, had only to produce certain deeds to recover the ancestral estates. At the end of the story, indeed, we are told that the grandchild—for the son had died in the meantime—learns that "the lawyers are confident of success." Miss Edwards evidently thinks that at the close of the Revolution, after the lapse of more than twenty years, the estates remained much as before, and ready for their former owners to claim as soon as they turned up and established their claims. Familiar though she clearly is with French books, she has not, it would seem, heard of the divisions and subdivisions of landed property in France.

The plot of this work would be somewhat difficult to describe unless we were to omit the two minor plots, which, though taking up not a little room, yet scarcely at all bear on the story. In one of these episodes we have the arrest and death of an escaped *forçat*, who is brought in, we should guess, by way of relief to the talks on art; and in the other we have the death of a gambling count, who in some mysterious way which we cannot make out, plays the part of a tyrant over his cousin. As she is secretly married to an English major, but cannot venture to live with him owing to the malignancy of her cousin, there is nothing left for the major to do but to follow the count into a private gambling-house, get into a quarrel with him over cards, shoot him through the heart in a duel, and then to retire with his wife to a quiet life in Italy. Why they could not have retired before the duel we are not told. Miss Edwards doubtless knew her powers, and wished to show that she could describe a Parisian "hell" and a duel with some degree of cleverness, and so we must not raise objections. With these minor plots cleared away, the rest of the story is simple enough. A professor of legerdemain gives an entertainment in a village in England. The hero of the story, the son of a doctor, attends. The professor, who by his breeding had shown that he had once been something very different from a conjuror, is taken suddenly ill at the entertainment, and dies. He had talked about his little daughter, and in his delirium about his châteaux. But "no papers or letters were found about his person," and no one knew his name. As soon, however, as we heard of the little daughter, our interest was at once aroused. As when in a conjuror's show an empty box is shown on one side of the table, and a thimble on the other, we know that before long the thimble will be inside the box, so in a novel, when we have the hero a boy in an English village, and a young girl left an orphan somewhere out of England, we know that the third volume will not have come to its end before they shall have died, or else are to live, in each other's arms. The son, at the age of twenty, went to Paris to study medicine. He lodged in the third story in a house in the Quartier Latin, and, as might have been expected, on the same floor lodged a young lady, who turned out to be the old conjuror's daughter, the last descendant of an old line of French nobles. Though the Fates had thus got over the chief part of the difficulty by bringing the two young people—one from a village in England, and the other from anywhere out of England—to the same floor of the same house, yet they had hard work left to get them introduced. Happily the hero was studying surgery, and so the heroine in due time drags down a bookcase on to her arm. She screams in her pain, and the hero climbs round by the balcony into her room, and does all that surgery can do. If they had been sensible young people they would soon have been married, more especially as the hero's father, with unusual considerateness on his part, goes off in a fit of apoplexy. But the heroine was very far from being sensible, and, sacrificing her love to her duty, goes off in her quest of her father. Why she could not have travelled after him and the family estates just as well with a husband we are not told. Nothing is heard of her for eight years, by the end of which time her lover's hair has "streaks of premature silver," and his first book of poems is published. Happily, before any more streaks "gleam," or any more poems are published, a chance discovery leads her to the scene of her father's death. There she meets her lover, and after the melodramatic scene we have already mentioned, owns her love.

In spite of its absurdities and its want of originality, the story is clever enough. The interest rarely lags, and where it does, a very little skipping will suffice. How far it would be enjoyed by people who know well the life and the society that is described, we cannot pretend to decide. We have known stories about the life of the students at our Universities which were thought very clever and lifelike by all except those who had been at one of the Univer-ities. There is some chance that the case might be the same with Miss Edwards's story.

BORLASE'S NÆNIA CORNUBLE.*

MR. W. C. BORLASE has undertaken in workmanlike fashion the examination and interpretation of the cromlechs, menhirs, and stone monuments of early Cornwall, which the simple folk of that region associate with "giants' graves" and similar fables. In performing his task he has aimed rather at setting forth illustratively the details of each discovery than at making such discoveries evidence in favour of a foregone conclusion. He has his own views on the subject, but he is less concerned to justify them than to furnish an accurate and candid statement of the facts. The subject is one which has grown in interest of late years, and Mr. Borlase is to be congratulated on approaching it at a point of time when some obstructions are already removed, and when, whatever may be said as to his doubt as to the strict demarcation between "Stone, Bronze, and Iron periods" in Cornish relics, no one is likely to do battle with him on behalf of the Druid theory, which was an article of faith with his ancestor and namesake. In common with those most versed in Cornish antiquities and traditions, Mr. Borlase holds that there is no ground for connecting Druidism with the megalithic series so grandly represented in Cornwall, except, indeed, in so far as it is highly probable that the pseudo-Druid and magician of the sixth century selected for his soothsaying and impostures such sites and stones as an exploded theory attributed to the genuine Druid of the first.

With his path cleared of such stumbling-blocks, Mr. Borlase approaches the consideration of the primitive sepulchres of his native county, and refers every mode of interment hitherto discovered in Cornwall to "the dolmen covered by a tumulus and surrounded by a stone circle," the dolmen without the tumulus, the tumulus without the dolmen, or the circle without either, or,—as he supplements Sir John Lubbock's description—to the two adjacent menhirs, and the simple standing stone. Dividing European cromlechs into the dolmen or cromlech proper, the Kist-Vaen, and the monument or cenotaph raised over an interment, he notices the first as of rarest occurrence, owing perhaps to its height and difficulty of construction, though it is represented in Cornwall by the remarkable cromlechs at Lanyon and Caerwynen, and as being a memorial superstructure over a plain interment by inhumation rather than a subterranean chamber. It is perhaps needless to say that of the three modes of interment in ancient British sarcophagi—namely, cremation, inhumation in an extended posture, and inhumation in a contracted fashion—the first is probably Roman and post-Roman, and the last most usual in pre-Roman England. The evidence for extended innumation in Cornwall is scanty and dubious; the evidence for contracted interments is more dubious still, though in the Kist-Vaens this mode of sepulture is more probable. In the genuine example at Trevelgue (on Lord Churston's property), the only question seems to be whether these "finds" of contracted skeletons do not represent the interments of some invading Normans, as the site of the

---

* *Nænia Cornubiæ: a Descriptive Essay, illustrative of the Sepulchres and Funereal Customs of Early Cornwall.* By William Copeland Borlase, B.A., F.S.A. London: Longmans & Co. Truro: Netherton. 1872.

barrow at the edge of a cliff over the sea, like Beowulf's grave, and the commonness of such interments in the north of Great Britain and in Scandinavia might seem to indicate. The Kist-Vaen, or cromlech of the second class, is, however, the more common type of Cornish sepulchre, and is a contracted representation of the dwelling of the deceased. As a rule, it would seem that the larger Kist-Vaens in Cornwall were meant for unburnt corpses; and, generally speaking, such instances as Pawton Kist-Vaen, and others like it in Cornwall, wherein extended interments are found, are not so much of the nature of Kist-Vaens proper as of quadrated stone graves, about which Mr. Borlase has an interesting digression. The occupants of such proper Kist-Vaens (wide and lofty in proportion to the length) as Chywoone and Bosporthennis, were deposited there for the most part singly and in a contracted position, nose to knees. That at Chywoone is said to be the most perfect and compact cromlech now existing in Cornwall, and the particulars of it may be summarized from Mr. Borlase's account. This building seems to have rested on the solid ground, and not on the surrounding tumulus. Two upright stones seem to have been first reared at the east and west ends, six feet apart, the breadth of the latter four feet, of the former three feet ten inches, and the height of each six feet four. A flat block, in length eight feet four inches, is set aslant against their northern edges, serving both as a part of the fabric and a stay to the sides against which it rests. Up this slanting stone, by aid of an embankment and rollers, the convex granite capstone, twelve feet in length and breadth, and from fourteen inches to two feet in thickness, has been raised to its present place. The height of the interior is seven feet, and in its centre, beneath the level of the natural soil, the body was interred. The chamber has been completed by a fifth stone, not reaching up to the capstone on the south side. The barrow or cairn is thirty-two feet in diameter, hedged round with upright stones. Stones of smaller size in the interstices have protected the interior of the kist from inroads of rubbish, and it appears as if the whole structure had once been totally buried in the mound or tumulus. Only a fractured flint (not an instrument or implement) was found in it when it was explored in 1871. Around the other Kist-Vaen above-mentioned at Bosporthennis are ruins of hut circles—one of them the best specimen of the beehive type of hut in England—which represent the ground-plan of a large town. It was once covered, beyond a doubt, by the stones and earth around it. Its speciality is its circular capstone lying in the area, and no longer *in situ*. This was pronounced to be unique, and the author has a good story of a genuine Cornu-Briton's explanation of this rude circular form as the work of Uncle Jan of Polmêor, the miller's, graving tool. His own inspection, however, leads him to think that it was originally oblong. The examples of chambered tumuli, or galleried graves, are extremely rare in Cornwall, and, occurring as they do near the sea, are suggestive of foreign construction, referable to a race of early pirates. The tumulus at Castle Enny curiously combines, however, the features of the stone grave, the ring barrow, the cromlech, and the passage chamber, and links them all in the chain of the megalithic series. The dimensions of the passage chamber in this instance seem to indicate extended rather than contracted interment, for it is six feet in length by three or three feet six in breadth; but there is no evidence in the matter, nor is it easy, according to Mr. Borlase, to find a genuine example of the more certain contracted interments in Cornwall, until we come to the examples at Trevelgue.

It is plainer sailing when we come to the second part of the Essay, which treats of interments by cremation—a practice seemingly not posterior to inhumation at least in Cornwall, where the exceptional contracted interments point rather to Christian date and usage, and where the instances of cremation are so rude as to mark a very primitive people and epoch. Perhaps here, as in Britain generally, the two modes coexisted side by side, the latter finally getting the ascendant. In Guernsey and even in Cornwall, at Lower Lanyon, an entire carcass has been found in company with an urn. Mr. Borlase's excavation of the ground around some half-dozen of the menhirs or "long stones" of Cornwall, which are accounted "sometimes monuments and sometimes memorials of important events," resulted in every instance in the discovery of charred wood, a deposit of splintered bones, ashes, and, in some cases, a small flint chip. The most important discovery was under the Treavenneck granite obelisk in the parish of Paul. Close to this pillar, where the plough could not reach, a farmer struck his tool against a flat block of stone eighteen inches square. Under it was a pit of solid clay walls, in the centre of which was a very perfect sepulchral urn, nearly twenty inches high and fourteen broad at the mouth, containing calcined bones and a molar tooth, while splintered bones and wood ashes strewed the rest of the pit. The vessel, hand-made, is of yellowish clay, scarcely baked externally, but inwardly black and hard, from the ashes having been placed in it hot. It is large, curious, and has two handles. This is very much the character of all the urns found in such positions in Cornwall, and here, as not seldom elsewhere, a smaller urn is in close proximity. The larger cinerary urns are either vase-shaped or barrel-shaped; they are found set upright, or, as is often the case, mouth downwards; whilst the smaller urns, sometimes surmised to have been drinking vessels, food vessels, or receptacles of incense, can scarcely have been used for such purposes in Cornwall, as they are always found in company with ashes. Amongst the examples of larger cinerary urns given by Mr. Borlase we do not recollect to have come upon one like that at Broughton in Lincolnshire, where one inverted urn had been made to fit the mouth of another standing upright. The author's researches abundantly prove the sepulchral nature of at least a large number of the Western menhirs, though some, like the Pipers and another pillar in Buryan parish, bear witness to a traditionary battle, or are parts of a commemorative monument.

It seems to us that the interest of this portion of Mr. Borlase's essay would have been more sustained if he had thrown into appendices several digressions which are of great intrinsic value, but which, as they are presented, distract the reader from the matter directly on hand. Thus we find the account of the burials by cremation in the neighbourhood of menhirs interrupted by an enumeration of the shapes and forms of Cornish mounds and barrows. Within this digression comes another on "Stone-Circles," one class of which, consisting of contiguous stones set on edge to enclose a rock, a few small mounds, or some uneven ground, is proved in many examples to be sepulchral. This ring of earth or stones was indeed an essential feature in the cairn-buildings of the West, whilst the upright stones on level ground apart from each other point rather to a civil than to a religious origin, and probably enclosed an area for popular assemblies. Another digression relates to the question whether the articles interred with the deceased were put there with a view to their utility in the next world. Mr. Borlase suggests that the few daggers, charms, drinking-vessels, gold cups, or ornaments which are found in Cornish barrows were deposited simply as votive offerings in token of affection. This too is the opinion of Canon Greenwell. Another question, whether "slave-killing" or "the suttee" was customary in Cornish barrows, he also answers in the negative. Only in the barrow near the Rosemoddress circle, near which tradition places the site of a battle-field, do the calcined ashes represent many bodies. Elsewhere, if there are tokens of a secondary deposit of ashes in a tumulus, it can be accounted for, in Mr. Borlase's opinion, either by secondary interments, or by separate collections of the ashes of the pyre. On the other hand, Mr. Jewitt, in his *Grave Mounds*, accounts confidently for the phenomena of double interments in the same barrow by the sacrifice of slaves and kindred round the departed head of the family.

One of the most fruitful explorations of which Mr. Borlase preserves the record in the latter part of his volume was that of Veryan Beacon or Mound, the legendary burial-place of an old Cornish Saint and King. Here, by sinking narrow shafts, at the bottom of each of which were ashes and half-calcined bones and light-coloured clay, it became evident that secondary interments had been made several times over, each time seemingly as near as possible to some sacred remains beneath the cairn. Right in the centre, over which oblong stones had been placed erect one above another from the base to the apex of the pile, was found, in due course, the Kist-Vaen containing the resting-place of the old King. In Jewitt's *Grave Mounds* we also read of barrows in which there were no less than six successive sepulchral interments, some by cremation, and some by inhumation. Here, it would seem, all were burnt. Another very important exploration was at Morvah Hill, or Trovean, where a brass Roman coin of a later Emperor, found in a cinerary urn, marks a date anterior to which the deposit cannot have taken place, though it does not necessarily fix it within the period of Roman occupation of Britain. Mr. Borlase adduces cogent evidence to show that the hut-dwellings so frequent in Cornwall, and in so many features closely resembling the tumuli in structure, deposits, and relics, are referable also to the period of Romano-British occupation. The sepulchral pottery, he holds, must be handed over to post-Roman times, and connected with the inhabitants of the beehive huts. And he is inclined, by a careful comparison of Cornish interments, such for instance as those in Trevelgue Barrow, to abridge greatly the supposed lines of demarcation between the periods of inhumation and of burnt bone-chips. In one mound is a Kist with a contracted body: and in a stratum, so to speak, next above it a secondary interment of the incinerated type; and this mound—where the two interments were apparently nearly contemporaneous—is confessedly a most ancient Cornish sepulchre. From this and other observations the author infers that there is in Cornwall no great distance of time between the two modes of sepulture, and he sees in the consideration of the stupendous cromlechs additional proofs of a later and metallic age. Whilst there is much in this essay to invite discussion and debate, its research and information are beyond all question.

BRADDON'S LIFE IN INDIA.*

THE reproach which Mr. Braddon brings against the British public, of extraordinary ignorance in all matters relating not only to India but to the manner of life of their relatives and fellow-countrymen in India, although undoubtedly a just one, yet admits of some faint degree of apology in the generally uninviting and technical character of what may be termed Anglo-Indian literature. The number of books descriptive of the country by persons competent to write about it is surprisingly small, if we consider how many Englishmen are resident there. Indian travels, the few that have been published, have been written for the most part by tourists passing rapidly through the country, who have never gone below the merest surface, and whose impressions

* *Life in India.* By Edward Braddon. London: Longmans & Co. 1872.

are therefore usually both worthless and uninteresting. At the same time it should in fairness be mentioned that the most accurate and complete account of the appearance of those parts of India which they saw—always excepting Heber's journals, which to this day form the best guide-book to the country—have been given to us by two travellers whose stay there was in each case but brief, Dr. Hooker and Mr. Markham. Sir John Kaye has done a good deal by his various writings to popularize the work of our Indian statesmen and administrators, but, generally speaking, Indian residents have too near a view of their subject to enable them to make it clear or interesting to those who come to it with no previous knowledge. But any person who wishes to obtain a clear conception of the ordinary aspects of life in India as presented to the European resident will now find an effective aid in Mr. Braddon's pleasant and amusing sketches, which bear the impress of accurate observation and graphic description, and really leave no room for excuse for ignorance of the more superficial aspects of Indian life.

Mr. Braddon sets out by exposing the popular delusion that a hot English summer day bears anything more than a general resemblance to the climate of India:—

> Major Porker, who is stout, and has a slight tendency in the direction of such uncomfortable ailments as apoplexy, walks from the Rag to his chambers in Jermyn Street on a July afternoon, and getting warm, propounds the dictum that it is as hot in London as it is in Calcutta. If Porker were to attempt to walk 400 yards on a July afternoon in Calcutta, dressed as he is, and in the hat he wears in London, the only matter of doubt as to the conclusion of this pedestrian feat would be whether *coup de soleil* or heat apoplexy carried him off first. Strange to say, many retired Anglo-Indians who have spent years in India appear wholly to forget what the Indian climate was, and fondly imagine that they are enjoying the summer warmth of Hindostan in the regions of Bayswater. . . . But nowhere in Europe can heat like that of India be discovered, unless we betake ourselves to the oven, furnace, or hot-house to find it.

And certainly, judging from the strong impression which it appears to have usually left on the residents in India, the extraordinary heat must be the predominant and almost ever-present characteristic of the country. Not always present, however, for the differences in climate are almost as great in different parts of India as in different parts of Europe, and while the Southern part suffers from the perpetual heat of the tropics, the more Northerly regions, and especially the Punjab—the principal station of the European garrison of the country—have a cold season almost approaching to a South Italian winter. Another variation is produced by the differences of elevation. The Himalayas of course present almost every climate, from the tropical hot moisture of the spurs which run down into the plains of Bengal, to the almost arctic rigour of the eternal snow. But a quite temperate climate is found all the year round in the sanataria on the lofty Neilgherry hills, in the South of the peninsula, and at twice the elevation of Ben Nevis; while the tablelands of the West, when cooled down by the moisture brought in from the Indian Ocean during the periodic trade winds, furnish a climate vastly superior to what is met with in the same latitude towards the East, on the sultry low-lying plains of Bengal.

Very graphic is Mr. Braddon's account of the social life of our countrymen in the East, scattered about as they are in small groups at what are called "Civil stations"—the headquarters, namely, of the administratation of each of the counties or districts which make up an Indian proconsulate or province. Although it would appear that there is a good deal of sociability in these little communities, still even here the line of demarcation between what is within and what is without the pale of society seems to be as strictly defined as in an English country town. All is not ease and reciprocity even in the limited circle of one of these oases of white faces:—

> Mr. Paikast, the deputy-collector, is in the unenviable position of hanging suspended, like a social Mahomet's coffin, somewhere between that aristocracy of which the judge is the head and a commonalty that has no head at all. No one of the upper ten (upper four or five more correctly) would, on the occasion of a station ball, use Mr. Paikast's house, if it were large enough (which it is not), or borrow his *epergne*, supposing the improbability of his having one. If fortune favour him, he may obtain a position in some or all of the station clubs. He may divide a sheep with the judge, the collector, and joint-magistrate; he may pore over those pages of the cheap magazines that have been skimmed by his official superiors, and he may enjoy other corporate privileges. He may be invited to station dances or unexclusive dinner parties as a matter of form; but though joining in these festivities, he is but a passive actor in them. He goes to the ball to find that every lady's programme is a sealed book to him. At the dinner he is driven by the rules of precedence to enter the dining-room last, and probably alone, and the banquet is for him about as lively as the entertainment of cake and wine provided for mourners at a funeral. . . . . His is indubitably an uncomfortable position. He may not become one of the "better class," and he cannot very well associate with the Jew shopkeeper or Eurasian clerks.

We do not understand whether Mr. Braddon would express approval of this rigorous ostracism, rendered necessary perhaps by the very isolation of these out-stations, but it strikes us that life in such places must, under any circumstances, be of a monotonous, not to say dreary kind, judging more particularly from the fact that private theatricals and balls appear to be the great resource against ennui. A condition under which a ball of a couple of dozen persons is regarded as an amusement, and where the performers at private theatricals are as numerous as the audience, must be one to which Sir Cornewall Lewis's famous apophthegm, that life would be very tolerable but for its pleasures, is peculiarly applicable. Whether intentionally or not, Mr. Braddon paints Indian station life in gloomy colours. On the other hand, camp life in the cold weather, when the climate of Northern India is little short of perfection, must have its pleasurable side, where tents are employed of a solidity and completeness unknown to other countries, and the European official, carrying all his comforts and household gods with him, goes forth with his army of retainers and flocks and herds of patriarchal dimensions, wandering at will over his district—of a size equal perhaps to a couple of Yorkshires—pitching his tent wherever the village trees offer a favourable shade, his occupations diversified between the dispensation of justice and the pursuit of game, abundant without the aid of game laws. A life of this sort, undisturbed by wind or rain or interruption of any kind, with its combined freedom and retirement, is certainly in striking contrast to the bustling, fragmentary, spasmodic existence, made up of keeping engagements and catching trains, to which most of us here are doomed; and the attractions which it appears to possess for most Anglo-Indians are readily understood.

In a useful chapter on the natives of the country, Mr. Braddon endeavours to dispel the extraordinary ignorance of English people regarding that generic personage, the native. For it is in truth extraordinary—indeed it is quite one of the phenomena connected with our rule in India—that we should know so little about them as we do. People talk glibly about "the natives," and the "teeming millions" of Hindostan (by the way, it is not the millions which teem, as is the fashion to say, but the land which teems with them), who have not the faintest idea that the civilization of India is as complex as that which exists here, and that the diversity of race and language is even greater there than is to be found in Europe. Notwithstanding our intimate connexion with India, social as well as commercial—and there is hardly an English middle-class family which has not a relative there—we literally know no more about it than we do about the obscure parts of South America, or the South Sea Islands. One reason is, we believe, the discovery of this unhappy appellation "the natives" to express the people of India, which operates as a balm for our indolence, discouraging further inquiry. A more potent one is, of course, that there is really so little information available about India in a readable form. Not that India is not made very free use of for certain literary purposes. When a young couple in a novel, without any apparent means of subsistence, have to be provided for, the difficulty is generally surmounted by shipping the hero off to India to a valuable diplomatic appointment; or if a competence has to be earned by any member of the family in a ridiculously short space of time, the person in question goes out to India to procure it, such arrangements being absolutely impossible under the Act of Parliament regulating admission to the Indian Civil Service, the entrance to official life in India being, in fact, fenced round with inexorable conditions. Even so well-informed a writer as Miss Sewell makes the father of Amy Herbert disappear on a mysterious mission to some Indian Court, where no trace of him can be found for a few years, every Indian Court, as a matter of fact, being in daily postal communication with the British Government; so that the episode was about as absurd as if one were to describe a hero as disappearing beyond the ken of the detective police because taking up an appointment under the London and North-Western Railway Company. But this instance is a trifle compared with the tricks which ordinary novelists play with India. One notable instance, a book written by a namesake of our present author, was lately reviewed in these columns, where one Robert Ainsleigh underwent a series of perfectly impossible and inexpressibly dreary adventures in that country. But these blunders are probably due in some measure, as we have said, to the dearth of readable descriptions of Indian life and manners, by which of course we do not mean the life and manners of the Anglo-Indians, who lead the life of self-inflicted ostracism sometimes affected by the officers of British regiments stationed there, but of the complex and interesting portion of humanity comprised in the two hundred millions of our Indian fellow-subjects. As a contribution to this useful purpose we may heartily recommend Mr. Braddon's lively volume, the work of a shrewd observer with a keen sense of humour.

NOTICE.

We beg leave to state that we decline to return rejected communications, and to this rule we can make no exception.

The SATURDAY REVIEW *is duly registered for transmission abroad.*

The publication of the SATURDAY REVIEW *takes place on Saturday Mornings, in time for the early trains, and copies may be obtained in the Country, through any Newsagent, on the day of publication.*

Nearly all the back Numbers of the SATURDAY REVIEW *may be obtained through any Bookseller, or of the Publisher, at the Office, 38 Southampton Street, Strand, W.C., to whom all Communications relating to Advertisements should likewise be addressed.*

Copies of the SATURDAY REVIEW *Bill of Contents will be forwarded every Friday Evening by post, paid, to any Newsagent in Town or Country on application to the Publisher.*

GENERAL SCHOUVALOFF'S MISSION.

ALTHOUGH the mission of General SCHOUVALOFF deserves all the interest which it has excited, the exact purport of his instructions is still open to conjecture. The secrecy which sometimes excites the indignation of impatient patriots is still an indispensable condition of diplomacy; and Lord GRANVILLE is perfectly right in not taking the newspapers into his confidence. The statement that the English Government had addressed a remonstrance or a warning to the Court of St. Petersburg was at first received with incredulous surprise; and it is not yet known whether it was literally true; but it is probable that the negotiations which have since taken place began with some communication from the English Ambassador. The immediate occasion of the discussion seems to have been the project of a renewed attack upon Khiva. A Russian expedition was a few months ago compelled to return without accomplishing its object; and consequently the Russian Government has determined to repeat the attempt with forces which can scarcely fail to ensure success. Three armies from as many different directions are to converge on Khiva; and probably they will overrun the territory and occupy the capital without encountering serious resistance. The ulterior intentions of the Russian Government are still uncertain. According to one probable statement, a large majority of a Council specially summoned to consider the question preferred the proposal of a permanent conquest to the alternative plan of a temporary invasion such as the march of POLLOCK on Cabul, or the more recent Abyssinian campaign. Although great questions of policy are probably not determined in Russia by majorities, the vote of a Council would indicate the policy of the EMPEROR and his Ministers. The reasons which may be urged in favour of the annexation by a civilized Power of the territory of a predatory border State are familiar to students of Indian history. It is sometimes safer and cheaper to govern neighbouring tribes than to repel their incursions. The rulers of Khiva can scarcely be trusted to observe the treaties which they may be compelled to conclude; and it is possible that under the stern rule of Russian officers the inhabitants might gradually acquire peaceable and orderly habits. There is a Russian flotilla in the Sea of Aral; and the occupation of the country would be facilitated by the water communication on the Oxus, especially if by drainage of swamps or by other methods the Russians could deal with the singular plague of insects which renders parts of the shores of the river uninhabitable. The natural capabilities of the oasis of Khiva are said to be considerable; but a long interval must elapse before the profits of Khivan commerce or industry would pay the expense of conquest. The Russians have hitherto sought in Central Asia, not terminal stations, but rights of way to more distant regions, and Khiva lies between the territory of the Empire and the newly acquired dependency of Bokhara.

While analogy and probability point to a policy of conquest, several English and foreign papers positively state that both Count SCHOUVALOFF and Count BRUNNOW have assured the English Government that the expedition to Khiva will return as soon as its object has been attained by a display of irresistible force, and by the release of the Russian prisoners in Khiva. It is added that no proposal for a line of demarcation between the two Empires can have been made by the English Ambassador at St. Petersburg; and this part of the statement may be confidently accepted as accurate. It is in the highest degree improbable that the English Government should have offered to recognize a frontier beyond the actual limits of the Russian dominions in Asia; but it is not equally certain that some boundaries may not have been indicated which could not be transgressed without risk of collision. It is well known that the complacent approval of Russian aggression which has often been gratuitously expressed in England meets with no kind of sympathy in India. It is not improbable that, after repelling the agent of the Khan of KHIVA who lately asked for his mediation or good offices, the VICEROY may have called the attention of the Home Government to the risk which might arise from the further progress of Russian arms in Central Asia. That Mr. GLADSTONE and his colleagues should have so far taken alarm as to enter into diplomatic communications with Russia on the subject is a sufficient proof that the danger is not altogether imaginary. The report that satisfactory assurances have been offered by Russia cannot be hastily accepted. If it were understood that the impending expedition to Khiva is to be merely a demonstration of superior force, there would be no sufficient reason for the negotiations which are notoriously in progress. The moderate and unambitious language which is attributed to the Russian Government offers a singular contrast to the hostile tone which is habitually adopted by the journals of St. Petersburg and Moscow. That all newspapers in Russia are positively or negatively subject to official control or inspiration is sufficiently proved by the absolute silence which they have maintained on the subject of General SCHOUVALOFF'S mission. It is evident that a Government which exercises the power of prohibiting unreasonable comments must at least tolerate the opinions which are allowed to find utterance. Since the introduction of a limited freedom of discussion in Russia, the newspapers have been employed as irregular auxiliaries of the diplomacy of the Government; and for a long time they have been in the habit of using unfriendly and menacing language to England. Even Lord NORTHBROOK'S refusal to interfere on behalf of Khiva was described by some Russian journals as an act of undue presumption. It is easy to understand that it may suit the Imperial Government to contrast the moderation of its official demeanour with the arrogance of writers who are ostensibly unauthorised; but it is scarcely probable that the entire scheme of Russian policy in Central Asia can have been systematically misrepresented by the journals.

If it is true that General SCHOUVALOFF has been instructed to repudiate the purpose of annexing Khiva, there can be no doubt that he has also stipulated for some equivalent concession on the part of England. It would be a great advantage to Russia to conclude a treaty of demarcation which would practically involve an alliance with England against the independent Mahometan States which might be included within the area of permissible conquest. On the other hand, the inconvenience to the English Government of any similar arrangement is universally acknowledged, while a formal notification of the line beyond which no advance could be tolerated would effect the purpose of the treaty without involving any reciprocal obligations. The only result of a boundary convention would be that Russia would not pass the agreed limits except as an act of war, and precisely the same penalty would attach to disregard of a formal intimation on the part of England. Only a few years have passed since Russia covenanted, not only with England, but with all the Great Powers of Europe, to abstain from the maintenance of a naval force in the Black Sea. As soon as it was thought safe to incur the possible consequences the treaty was deliberately renounced; and the English Government thought fit to surrender its rights rather than to assert them by force, or to reserve them with a view to future contingencies. It might in ten or twenty years be found not less inconsistent with the dignity of the Imperial Government to recognize any limit to its annexations in Asia than to abide by the restriction on its operations in the Black Sea.

Another reason against the supposed project of treaty may be found in the uncertainty of the circumstances which might attend any future annexation. A conquest or expedition which involved the co-operation of Persia, or the friendship or enmity of Afghanistan, could not be indifferent to Indian interests, although the immediate enterprise might not extend beyond the stipulated limits. It is not prudent to assent beforehand to any engagement of which the application and the consequences cannot be distinctly foreseen. There is no reason to believe that General SCHOUVALOFF's proposals are at the same time so simple and so unacceptable as the project of a boundary treaty.

The danger from the Russian conquests in Central Asia which has been apprehended in England is the same which has been constantly held out as a menace by Russian writers. No reasonable fear can be entertained of a Russian invasion of India; because it could only be undertaken with comparatively scanty resources against an enormous superiority both in numbers and in the quality of armaments. As long as the Suez Canal was open it would be much easier to send reinforcements to India from England than from any part of European Russia; and on the whole it may be confidently asserted that no enterprise of the kind will be attempted for many years to come. Nevertheless the possession of India would be made more expensive and more troublesome by the vicinity of a powerful rival; and Russian politicians have long flattered themselves that, by encouraging or threatening disturbances in India, their Government would have the means of putting a pressure upon English policy in other parts of the world. It is highly probable that General SCHOUVALOFF is at present engaged in trying in the most conciliatory form some experiment of the kind. It would be a brilliant stroke of diplomacy to obtain, in consideration for a postponement of the annexation of Khiva, concessions which the acquisition of the Khanate might perhaps serve as an alternative method of extorting. On the other hand, it is not improbable that the English Cabinet may require some security against encroachments in other quarters. There are indications of a disposition on the part of the Russian Government to tighten its hold on Persia, which might become a more formidable neighbour to India than any barbarous State in Central Asia. It is from the West rather than from the North that an invasion of India, if it were in any way practicable, might be attempted with the most reasonable prospect of success; and in the meantime the Persians, who have often given trouble on their own account by encroachments on Affghan territory, would become formidable if their enterprises were supported and backed by Russia. The increased influence of Russian diplomacy at Constantinople which has naturally resulted from the rupture of the Treaty of Paris may perhaps suggest other reasons for precaution. If Russia is really desirous of a friendly understanding, there ought to be no insurmountable difficulty in settling the terms of an arrangement; but for the present no sanguine expectation can be founded on General SCHOUVALOFF's visit.

THE EMPEROR AND THE IMPERIALISTS.

THE ceremonies preceding and attending the funeral of the EMPEROR were in accordance with the traditions of Royalty, and were redeemed from being a mere show by the sincerity of the respectful feelings by which they were accompanied. But there is something ghastly in the pageantry of death, and there is a relief in thinking that it is at an end. Although the grief for the EMPEROR may not have been very profound in Paris, and although occasion was taken by some of the enemies of the Empire to show an indifference or exultation beyond the bounds of good taste, yet there was a decent appearance of mourning on the day of the funeral, and a large body of Frenchmen of all ranks were in attendance at Chislehurst. That the friends of the Empire who have thrown in their political fortunes with those of Imperialism should be there was a matter of course, but there appears to have been a numerous gathering of those who valued or regretted the EMPEROR sufficiently to make a long journey without any political motive, merely to testify their respect to his memory. Ample evidence was also given of the favourable sentiments of Englishmen to a sovereign who was at least a friend of this country, and who appealed to the sympathies of the public by the greatness of his misfortunes and the fortitude with which he bore them. The Royal Family took part in the general manifestation so as to satisfy all the claims of a dynasty the head of which has been long on excellent terms with the family of the QUEEN, but not so as to mark any prepossession that could be twisted into having a political meaning. The friends of the BONAPARTES are perfectly aware that the civilities which the different members of foreign Royal families receive here are not intended to show any preference as between one Government of a foreign country and another. The ORLEANS Princes have only lately left England, where they were received with as much cordiality and respect as the family of their chief adversary can possibly hope to receive. One country alone has justly discharged a special debt of gratitude by paying exceptional honours to the memory of the EMPEROR. Italy has not been so mean as to forget or to refuse to acknowledge its recollection of the services rendered to her by NAPOLEON III. The French irritated the Italians on many occasions. The EMPEROR himself often thwarted them, and he left it to Prussia to complete the work of liberation he had begun; but still the indisputable fact remains, that united Italy owes its existence to the late exile of Chislehurst; and the Italians have warmly recognized what they owed him, and have marked their sense of their obligations by the readiness with which they have made his death an occasion of paying the last tribute of respect they could bestow.

The Imperialist journalists in France have got very buoyant and excited under the influence of events which have attracted so much notice to their chief, and have stated plainly how hopeful they are of the future, and how fondly they are attached to NAPOLEON IV. Their Radical adversaries have naturally complained of the license accorded to the Imperialists, and no demonstrations against the existing order of things could have been more bitter or more unguarded. But the Government has taken a very sensible view of the matter. It has replied that the interval between the death and the funeral of the EMPEROR might properly be regarded as an exceptional time during which utterances of party affection or party spirit in favour of the EMPEROR might be overlooked; but that when things returned to their ordinary state proceedings would not be tolerated which would then be not testimonies of respect to a deceased chief, but attempts to subvert the existing Government. Much the same may be said of most that has been written in the last few days both in England and abroad as to the EMPEROR and his career. What has been expressed has been not the deliberate judgment of calm critics, but the passing opinion of men whom good feeling prompted not to be behindhand in saying all the good that could be fairly said of a remarkable man just dead. While the EMPEROR was reigning in his glory, and still more when he was conducting, or had just conducted, France to her ruin, the consideration of the salient points of his personal character naturally occupied very little of the attention of the public. It was quite irrelevant to a discussion of the Mexican expedition, or of the means by which plébiscites were obtained, or of the early days of the German war, that the EMPEROR was steady in his friendships, kind-hearted, ready to listen to newcomers, free from sordidness and parsimony. On the other hand, when the EMPEROR died in exile and under a cloud, it seemed harsh to dwell on the faults of his political career, and his personal qualities came into sudden prominence. This was quite right. Justice cannot be done to any one all at once, and there is a time for blaming and a time for praising. But now that the excitement of his death and funeral is over, criticism must gradually resume its usual course. Nothing new has been found out to the credit of the EMPEROR which was not previously known, and a man who took upon himself to govern a great country for twenty years must be judged mainly as a governor and not as a private man. There is no means of casting off from the memory of the EMPEROR the burden of responsibility which attached to him while he was alive and had France in his power. However kind, and patient, and resolute he may have been, and whatever may have been his good intentions, he began his Empire with the *Coup d'état* and ended it with Sedan, and he, like other men, must be judged by his deeds, and his works must be measured by their fruits.

The Imperialists affect to be in no way disheartened by the death of the EMPEROR. To them one Emperor is dead and another has begun his reign. The new Emperor will be, they point out, of age next year; that is, he will be a boy eighteen years old. No necessity, therefore, occurs for the creation of a Regency. That France would not much like a woman as a Regent, and that Prince NAPOLEON could not be trusted to replace the EMPRESS, is therefore a matter of indifference to them. They will have their Emperor ready quite as soon as they can get an Empire ready for him to reign over; and they pretend to be

perfectly confident that the time must come when the Imperial Government will be restored. Nor is it to be supposed that they are merely trusting to the chapter of chances, and, on the principle that nothing happens in France except what is unexpected, believe in the restoration of the Empire simply because it is improbable. They mean something when they talk of the Empire as an abiding institution, and see vitality in nothing but Imperialism. To most men the late EMPEROR appeared inseparable from the Second Empire, and the Empire endured because the EMPEROR was there to make it endure. This is not at all the genuine Imperialist theory. Its partisans look on Imperialism as simply the true way of governing France. It is, as they sometimes term it, the modern form of monarchy, and they offer France at once the strength of monarchy and an accordance with modern ideas. The EMPEROR did not manage the Empire by himself; he had a band of resolute men, capable of daring anything, and understanding the machinery of government, ready at hand to assist him; and the disasters of his later years were, in the opinion of ardent Imperialists, mainly owing to the fact that he never replaced these associates as he lost them with men of anything like equal resolution and ability. If a new DE MORNY, a new PERSIGNY, and a new ST. ARNAUD managed somehow to get hold of the reins of power, they could carry on affairs according to the true pattern of Imperialism in the name of a weak lad as well as under any other shelter. Once placed in power, they could bribe and pamper the army, make use of the priests, drill voters through préfets and maires, get plébiscites made in any quantity to order, use artillery in the streets, and deport wholesale to Cayenne. In return for the country permitting this, or looking on helplessly while it was done, they could find work for artisans, help the country to grow rich, use the finest phrases about nationalities, and do everything they did in the name of the people. There are a great many Frenchmen who sincerely believe that, apart from the prizes which this mode of governing would bring to those who got hold of the top places, it is the only way of governing France that really suits France. There are still more who are not quite sure whether it is a good way of governing France or not, who regret the Empire for various personal reasons, and who, if the Republic came to be discredited, might be persuaded that Imperialism was again worth trying, and that it would at least save them the trouble of further thought. This whole view of politics seems to us founded on a mistake, and the real truth appears to be that Imperialism, detestable in itself, was only saved for a time from the obloquy it merited by the late EMPEROR being in many respects better than his Empire. The disasters that attended his downfall, the decay of the Napoleonic legend, the growing sense and sad experience of the people will, it may be hoped, make a new triumph of Imperialism impossible. But in estimating the prospects of France and the chances and aims of French parties, it would be a great mistake to overlook the fact that Imperialism means something distinct from any particular Emperor, and that the Imperialists have a system which they wish to revive, and not merely a boy whom they choose to honour, when they proclaim their adhesion to the cause of NAPOLEON IV.

MR. LOWE AND THE MALT-TAX DEPUTATION.

THE dissatisfaction which must have been felt with Mr. LOWE'S answer to the Malt-tax deputation will extend beyond the Chambers of Agriculture. It had indeed not been expected that even a part of the tax would be removed in the present year; but the announcement that there is no large surplus will produce general disappointment; and it could scarcely have been expected that Mr. LOWE would seize so irrelevant an occasion of indicating the wish of the Government to sow dissension between landlords and tenants. The non-existence of a surplus can only be explained by some financial arrangement which will not be universally approved; nor is it difficult to guess the nature of the contrivance by which demands for the reduction of taxation are to be evaded. In popular language, the excess of the revenue over the expenditure of the current year is sometimes confounded with the surplus which may be disclosed in the forthcoming Budget. When a Chancellor of the Exchequer officially speaks of a surplus, he refers exclusively to the estimates of future receipt and expenditure; and the actual state of the public finances is only so far material as it may supply a basis for calculation. It has always been known that the payment of the American damages under the Geneva Award would absorb the whole or the greater part of the surplus either of this year or of the next. It may be inferred from Mr. LOWE'S announcement that he has applied the current surplus in the ordinary course to the reduction of the Debt, and that the whole amount of damages will appear in the Budget as a part of the estimated expenditure for 1873-1874. The Government will probably decline any responsibility for a course of action which is prescribed by law. The Commissioners of the National Debt are bound on the certificate of the Treasury to apply surplus funds as they accrue to the redemption of debt; but, on the other hand, the Chancellor of the Exchequer must have a certain discretion as to the amount of the disposable balance. It would certainly have been in the power of the Government to apply, with or without the express sanction of Parliament, the excess of the current revenue to the discharge of an obligation which is as much a debt as if it had formed a part of the Consolidated Annuities. It has been known since the middle of September that the payment of the damages would be due in July; and when so considerable a charge was imposed on the national capital, the reduction of the ordinary debt might perhaps have been suspended. It is impossible to suppose that when Mr. LOWE declares that there will be no considerable surplus he can mean that a surplus which would otherwise exist has been appropriated by the Cabinet either to the relief of local taxation or to any other voluntary purpose. There can now be no doubt that the American damages will be included in the estimated expenditure of next year. If it had happened that the payment had become due a few months sooner, there would have been a surplus of three millions.

Mr. LOWE thoroughly understands the great principles of political economy, but he sometimes overlooks the limitations which are involved in the very nature of the science. An economist, like a mathematician, reasons on assumptions which are never exactly true in practice. If a scientific mechanician were informed by a carpenter whom he had employed to make a model that his calculations would not work, he would immediately conclude that he had not made a sufficient allowance either for friction or for some peculiarity in the nature of the materials. When all the farmers of England have made up their minds that the Malt-tax injuriously affects their operations, a cautious financier might perhaps doubt the certainty of his own conclusions to the contrary; but it is not in Mr. LOWE'S character to prefer empirical results to the supposed consequences of logical demonstration. The members of the deputation had laid much stress on the burden imposed by the Malt-tax on the consumer; and some of them asserted, with a perhaps excessive pretence of accuracy, that the duty was equivalent to an Income-tax of 5*d.* in the pound on a labourer's income. Other speakers added that beer was an indispensable element in the production of corn, because the labourer would not work without it; but perhaps they failed to discern the obvious inference that, if they were right, the burden fell rather on the employer than on the workman. Their general doctrine, that taxes on commodities chiefly affect the consumer, was both sound in itself and consistent with Mr. LOWE'S economic orthodoxy. He declared with evident sincerity that he would willingly relieve the working classes and other consumers of beer if only he had been able to spare their contributions to the revenue; and he took occasion to add that he was not disposed to inquire too minutely into the quantity of beer which the labourer might, in the exercise of his discretion, think fit to drink. It is possible that, as Mr. LOWE said, cheap beer might promote temperance, by partially displacing more deleterious liquors, and, at the worst, a man who has drunk too much beer is less offensive than a man who has drunk too much gin. Although the bulk of indirect taxation is paid by the consumer, it is evident that any consequent diminution of demand must also affect the profits of the producers. The landowners and farmers who waited on Mr. LOWE can scarcely have needed to be told that barley would not be grown unless it returned an average profit to the cultivator; but they also knew that if more beer were drunk their production might be advantageously extended; and they had stated in detail the injurious effect of the Malt duty on the provision of food for cattle. One Suffolk farmer asserted that on one hundred acres of barley the tax amounted to 540*l.*; and it can scarcely be assumed that the whole of the charge is recovered from the purchaser. It has not generally been thought in England that the French tax on raw materials tends to encourage manufacturing industry; nor would any Chancellor of the Exchequer succeed in convincing a Lancashire Chamber of Commerce that a duty upon cotton would fall exclusively on the wearers of calico. There is nothing special in malt which can justify

a tax on a partially manufactured article, except that the vast consumption secures an enormous return to the Exchequer. The Malt-tax sustains itself by its own bulk and weight.

The most objectionable part of Mr. LOWE's reply was his gratuitous attempt to distinguish between the incidence of the tax on landlords and on tenants. When two classes, assuming that their interests are identical, complain of a common grievance, it is at least an invidious task to prove to them on scientific grounds that they are labouring under a misapprehension. One of Mr. LOWE's colleagues has proposed to meet the joint complaint of owners and occupiers in the matter of local rates by redistributing the burden between them; and in pursuance of the same policy Mr. LOWE informs the tenant farmers that the Malt-tax, as far as it is not paid by the consumers, is a burden not on their profits but on the rent. It follows from Mr. LOWE's doctrine that it would be impossible by the imposition of the most perverse and extravagant burdens on agriculture to do the farmer any harm. A tax of twenty per cent. on grain, on cattle, on turnips and mangold, would not justify a deputation of farmers in making a complaint to the Chancellor of the Exchequer; and it might with equal plausibility be contended that the absurdest system of taxation would be innocuous to any other branch of industry. The commutation of tithes which had been supposed to remove a heavy burden on agriculture proves, if Mr. LOWE is in the right, to have been only a boon to landlords.

It was perhaps scarcely courteous to inform a body of intelligent farmers, representing large numbers engaged in the same business, that they were mere dupes, unconsciously put forward to fight the landlords' battles. Mr. LOWE is not in the habit of suppressing unpalatable truths: and "he does not "scruple to say that, whatever benefit would be derived from "taking off the tax beyond that derived by the consumer, "would necessarily fall into the rent. It would be assumed "that your holdings were more profitable because the tax was "taken off, and then, if you are content, and if people like you "are content to hold your land at its present rate, others would "come in and bid against you in the hope of realizing the profit "you did, and you would either have to pay that portion of "profit to the landlord, or be replaced by others who would "be willing to do so." When a Minister finds it his duty to enounce disagreeable propositions, he ought at least first to ascertain that they are true. Mr. LOWE might advantageously have remembered that the members of the deputation might possibly understand their own business sufficiently well to discern unsuspected flaws in his sublime demonstration. If all tenants in England held at extreme rack rents determined from year to year by every turn of the market, and if custom and feeling gave them no goodwill in their holdings and no preference over new comers, Mr. LOWE's arguments would be applicable to their condition. As an entirely opposite relation actually prevails between landlords and tenants, it is certainly not true that they would, as a general rule, be deprived by the competition of strangers of any benefit which might result from the repeal of the Malt-tax. Mr. LOWE may be right in his assertion that, if the repeal of the Corn-laws had largely diminished the profits of farming, the loss would have mainly fallen on the landlords. An increase or decrease of twenty per cent. in the value of the land would immediately affect the rent; an increase of two or three per cent. would be retained by the tenant. The CHANCELLOR of the EXCHEQUER will find that he has failed to satisfy the farmers that the Malt-tax is not a grievance inflicted on themselves, as it is undoubtedly a fiscal anomaly. The sum produced is too large to be sacrificed in any single year, but it might be judicious at the earliest opportunity to reduce it by one half, as a step towards a total repeal. As the brewers took no part in the deputation, the effect of the tax on a valuable branch of export trade was not mentioned in the course of the discussion.

THE UNITED STATES AND CUBA.

MR. FISH published at Washington on the 10th of January the abstract of a remarkable letter which he had addressed to General SICKLES, as American Minister at Madrid, on the 29th of October. The Spanish Government has since formally declared that no such communication had been received at Madrid. It appears, therefore, that the document was originally intended in the first instance for home use; and probably General SICKLES may have been instructed to delay the communication to the present time. It is evidently impossible that the Spanish Opposition should both have forged an apparently official document and procured its insertion in the New York papers; yet no argument which could have been devised would have been so embarrassing to the promoters of emancipation as the American despatch. The remarkable coincidence between the publication of the despatch and the pro-slavery agitation at Madrid indicates American rather than Spanish ingenuity. If the abstract of Mr. Fish's letter to General SICKLES is genuine, it follows that the moderate language of the PRESIDENT's Message on the subject of Cuba conveyed a false impression. The rumour which was circulated on the eve of the Presidential election, for the purpose probably of influencing popular feeling, appears to have been strictly accurate. The journals which supported the candidature of General GRANT frequently contained statements to the effect that his second term of office would be distinguished by a more active and aggressive system of foreign policy; and now it appears that the American squadron in the Pacific is ordered to the Sandwich Islands, while designs upon Cuba are almost openly avowed. It was perhaps in preparation for the disturbance of friendly relations that the PRESIDENT and the SECRETARY of STATE had previously insisted on retaining a Minister at Madrid who was personally and officially obnoxious to the Spanish Government. General SICKLES is "instructed to remonstrate in "decisive but respectful terms against the apparent failure "of Spain to carry into effect emancipation and other reforms "promised in her West Indian Colonies." If it is asked what the United States have to do with any kind of reform in the Spanish dominions, the answer is obvious, if not wholly satisfactory. America is strong and Spain is weak, and America covets the possession of territory which can scarcely be appropriated without some preliminary pretext of quarrel. "The United States Government has," it seems, "a warm interest "in the orderly condition of Cuba, and its watchfulness is "severely strained to preserve neutrality." A few years ago the watchfulness of another Government was severely strained to preserve neutrality, not in a sporadic insurrection of rebels without standing army, head-quarters, or visible government, but between two powerful belligerents disposing of vast armaments and conducting regular hostilities with varied fortunes. It was not then thought by the Government of the United States that the difficulty of preserving strict neutrality could serve as an excuse for threatening interference in favour of insurgents. On the contrary, Mr. FISH, in the name of General GRANT, demanded damages to the amount of three or four hundred millions, because the vigilance of the English Government had not been sufficient to prevent the evasion of three or four unarmed cruisers destined for the service of the Confederates. Mr. FISH now informs the Spanish Government with insulting coolness that "the trial of its impartiality by "the want of success on the part of Spain is so severe that, "unless she soon becomes more successful, it will force upon "the United States Government the consideration of the "question whether a duty to itself and the commercial interests of its citizens may not demand a change in the line "of action hitherto pursued." If the American agents at Geneva could have referred to a similar despatch as proceeding from the English Government, their libellous acrimony might have had some shadow of excuse.

There is some reason to fear that the publication of the document after an interval of two months indicates a purpose of active interference; but the immediate motive for offering a public affront to Spain may perhaps be found in Señor ZORRILLA's recent declaration of policy. The KING and both Houses of the Cortes have, in conformity with the proposal of the Minister, formally recorded their intention to abolish slavery during the present year in Porto Rico; yet it is known that emancipation is to be strongly resisted, and the most plausible excuse for opposition is the suggestion that the Government is acting in obedience to the dictation of the United States. It is obvious that the maintenance of slavery in Cuba would become impossible after the emancipation of the slaves in Porto Rico, and it would not be agreeable to the advocates of American aggression to be deprived of a pretext for the prevention of their designs. Mr. FISH has, probably of set purpose, furnished all the malcontent Spanish factions with an argument against emancipation which will be, of all other reasons, the most popular and effective; and if the Bill is consequently lost, and the Ministry driven from office, it will become the painful duty of General SICKLES to remonstrate in still stronger language against the obstinate maintenance of slavery in the Spanish colonies. As there happens to be no insurrection in Porto Rico, complaints of the difficulty and hardship of preserving neutrality will only apply to Cuba; but "delay of emancipation and other reforms" can be alleged

as a reason for seizing any Spanish island which may attract American cupidity. ZORRILLA perhaps thought that his Porto Rico Bill would to a certain extent satisfy American exigency; but he is by this time aware that his project of emancipation has only precipitated the diplomatic conflict. When the Empress CATHERINE had resolved on the partition of Poland, she vigorously opposed the efforts of Polish patriots to reform the obsolete institutions which furnished an excuse for her interference. The American PRESIDENT cannot openly avow his objection to the emancipation of slaves in Porto Rico; but his SECRETARY of STATE, with a watchfulness severely strained, interposes every possible difficulty in the way of abolition.

American projects for the acquisition of Cuba have the questionable merit of consistency. Seventeen or eighteen years have passed since the American representatives at the Western Courts of Europe met at Ostend with the sanction of their Government for the purpose of concocting a strange declaration that the possession of Cuba was indispensable to the security of the United States. One of their number, Mr. BUCHANAN, having been soon afterwards elected President, formally recommended to Congress in his first Message the acquisition of Cuba. The professed object of the American Government was not at that time to promote emancipation, but to insure the continuance of slavery, and to strengthen the institution in the South. The supplementary reasons for taking the property of others vary with changing circumstances; while the transfer of possession from the weaker to the stronger claimant is a common element in the process of spoliation. If the Spanish Government had possessed sufficient wisdom and vigour to abolish slavery in Cuba immediately after the adoption of the principle by the Cortes, Mr. FISH would have been compelled to devise some less plausible argument for his menace of interference; but it is idle to suppose that ambitious designs can be thwarted by the withdrawal of colourable pretexts for aggression. Two or three years ago the PRESIDENT, in spite of domestic opposition, long and obstinately prosecuted a scheme for the annexation of the independent territory of San Domingo; and the announcement that an American Company has obtained a lease of the harbour of Samana seems to imply that the project is revived. There was no slavery in San Domingo; and if there were civil or foreign wars, it was not alleged that the watchfulness of the American Government was severely strained to preserve neutrality; but San Domingo contained rich lands and useful harbours; and Cuba is larger, richer, and better adapted to maritime intercourse than San Domingo. When Cuba has become a part of the United States, no long period will elapse before it is discovered that the English West Indies ought in turn to be annexed to Cuba. It cannot indeed well be alleged that emancipation, in which England preceded America by thirty years, has been unduly delayed; but some successor of Mr. FISH will perhaps demand other reforms in Jamaica; and if England should unhappily become as powerless as Spain, it will become a question whether "the "duty of the United States Government to itself and to the "commercial interests of its citizens may not demand a "change in the line of action hitherto pursued."

The Republican majority in the American Senate will probably not be inclined to oppose the PRESIDENT'S aggressive policy. Mr. SUMNER, who took a principal part in resisting the annexation of San Domingo, has, by his own fault, lost the considerable influence which he once possessed; and perhaps, even if he were still Chairman of Foreign Affairs, he might not oppose a scheme by which emancipation would be accelerated. The most judicious American politicians disapprove on sufficient grounds of the extension of the Republic into regions inhabited by inferior or alien races. The Spaniards, the creoles, and the negroes of Cuba would not furnish a desirable addition to the roll of American citizens. It is sufficiently embarrassing to be troubled with WARMOTH and PINCHBECK elections in Louisiana, and with contests between negroes and Northern adventurers in Alabama or South Carolina. The nomination at Havannah of United States Senators would probably not be an edifying proceeding. It is already known from the speeches of Señor ZORRILLA that the Spanish Government cannot have complied with the express or implied demands of the United States; nor is it easy to foresee the next stage in the controversy. The PRESIDENT and Senate can scarcely issue a declaration of war in the absence of all provocation, and if they wish to recognize the insurgent Government, they will first have to create it; but when the wolf and the lamb come together, grounds of quarrel may always be found. A refusal to allow the seizure by Spanish cruisers of American vessels conveying cargoes for the use of the insurgents would speedily provoke a collision, and if hostilities once begin the conquest of Cuba is inevitable. The marvellous invention of arbitration which still excites the admiration of some English philanthropists will scarcely be applicable to a war undertaken for the sole purpose of annexing foreign territory. Even a Geneva Tribunal could scarcely award the possession of Cuba to the United States on any of the pretexts which are alleged by Mr. FISH; nor would the Spanish Government agree to be bound by retrospective rules to the effect that islands belonged to the rulers of the neighbouring continent. Mr. FISH may find numerous precedents, not in international law, but in the diplomacy of superior force. The despatches of NAPOLEON when he intended to seize Naples, or Tuscany, or Hamburg, are framed on the same principles which are reproduced in General SICKLES'S demands.

RECENT POLITICAL SPEECHES.

THE reassembling of Parliament will soon put to silence most members of Parliament. It is natural, therefore, that many members should be making what little hay they can while the sun of the vacation is still shining, and that the columns of the daily papers should be full of the utterances of members to their constituents. Through almost all of them there runs the same complete absence of matter. The speakers have to make their bricks, but no one will give them any straw. There are two reasons for this; the first being the want of any strictly party question; and the other, the fear felt by the speakers lest they should commit themselves by expressing an opinion on subjects too big for them. Irish Education and Local Taxation are expected to be the two principal themes of debate next Session; but there is no speaker addressing any constituency, or of any party, who ventures to tread on such dangerous ground. Accordingly the tendency is strong to talk mere platitudes, and to debate for ever such vague and useless questions as whether reform means revolution or progress. The truth is that at the present moment there is no difference whatever between the political position of the mass of Liberal members and that of the mass of Conservative members. Mr. CHILDERS spoke at Pontefract last Monday, and cited the Conservative member for King's Lynn to show that when a nation is said to want rest, all that may be meant is that it should quietly persevere in the good course on which it has entered. This is all very proper, but how is a Liberal to be distinguished from a Conservative by the use of such phrases? Party men cannot separate themselves from each other except by having points of difference, yet now party men talk the same language. The Conservative wishes to uphold that which exists, including the disestablished Irish Church, the sacrificed Irish landlord, and vote by Ballot. So does the Liberal. Each year the Conservative point of view changes, for it approves of or accepts all the measures the Liberals have carried. Thus at the end of a Session the parties are on the same platform. But the Conservative says that the measures which the Liberal is likely to propose in the next Session are sure to be dangerous, while the Liberal says they are sure to be excellent. This might create a real divergence of opinion if it were but known what the forthcoming measures were to be. But no one knows, or pretends to know, or even pretends to care to know. They will be measures relating to those two dangerous and mysterious subjects, Local Taxation and Irish Education; and to most members of Parliament these subjects are as strange and as distasteful as the politics of Central Asia. Both parties keep aloof from them; and the same may be said of what is called the Land Question. There really is no such thing as a definite Land Question; but it seems to speakers who follow one another like a flock of sheep that somehow there ought to be. When they come to think what they have to say about land, they can remember nothing but that the transfer of land ought to be facilitated, and perhaps that the law of intestate succession with regard to land should be altered. This is the whole of the Land Question as it appears to the ordinary member, although it does not seem half so big to him as he feels it ought to do. Directly persons who talk of the Land Question go further, they either proceed to discuss matters which do not affect land more than any other kind of property, such as what is called the Law of Entail, or they wander into dreams of Socialism. But within the tiny range of the facilitation of the transfer of land, and of an alteration in the law of intestate succession, there is no room for party feeling or for any great party differences. The people whom the proposed reforms would principally affect are the

solicitors, and solicitors when threatened forget and make up party differences. All that the ordinary member feels on the subject is that if a new system of land transfer is instituted, he should like the credit of it, if it is a success, to be laid to his party, and the discredit of it, if it is a failure, to be laid to the other party; but as he is utterly unable to judge whether it is likely to be a success or not, he prudently holds his tongue as to details, and wisely pronounces that he is for a good sound measure on this most important point.

There is not the slightest blame to be attached to members because in such a state of things they make speeches which are necessarily dull and tame. Mr. CHILDERS is a man of ability, and if he talked a series of platitudes for a couple of hours, lesser men need not be ashamed of doing no better. But to say nothing is distasteful to men of some activity of mind, and some of the more adventurous members have tried to find a field in discussing the principle of applying arbitration to the settlement of international differences. Liberal members are especially given to this, and they are fond of proclaiming that this reference to arbitration is a grand Anglo-Saxon discovery, and of boasting that the two divisions of the race have given an example to the world. Mr. SHAW LEFEVRE has devoted a whole speech to the subject, and he evidently did not speak without having bestowed some thought on it. He has gone so far as to discover that arbitration could not have prevented any of the wars which have taken place in this generation. It could not, he owned, have prevented the Crimean war, or the Italian war of 1859, or the German and French war. This seems a very sober and rational view of the matter, but it is a sad limitation to the efficacy of the new discovery. It appears that before it was revealed as the gift of Anglo-Saxons to the world, the wars that might have happened, but did not happen, were prevented without it; and that it could have done nothing to prevent those wars which actually took place. The only case in which it is even supposed by those who most admire it to be applicable is to prevent a war between nations who do not wish to fight. There are only two nations in constant danger, really or apparently, of a collision, and yet who are both averse to a war with each other—England and the United States; and the Anglo-Saxon discovery is therefore, so far as can be seen at present, exclusively beneficial to those who are called Anglo-Saxons. It is a means of avoiding war with America. The question is whether it is a good way, and the answer seems to be that it is a good way within the limits in which arbitration has always been recognized as useful, and no further. Mr. SHAW LEFEVRE set out by saying that he was always of opinion that England was wrong with regard to the *Alabama*, and was bound to make compensation for her misdeeds. This view, if the right one, would have made things very simple. We should only have had to acknowledge that we had been wrong, and settle the amount to be paid. If we could not have agreed as to the amount, this would have been exactly a point which we might have referred to some outside Power or person to decide for us. As it was, we attained a simple end by the most roundabout process possible, and had to submit ourselves to endless humiliation to arrive at it. Every one is glad to have avoided a war with America on a point of very minor importance; no one minds paying the money which the Arbitrators have decided we should pay. But the Conservative leaders have an opportunity which, if they are fit to govern the country, they should not lose, of reviewing the history of the *Alabama* negotiations, treaty, and award, in order not to attack the Ministry or to quarrel with the general result, but to guide the future policy of the country whenever difficulties of a similar kind arise.

As the bulk of Ministerialist and Opposition speakers have nothing to say, it is natural to turn to more extreme men to learn what is going on in circles where greater excitement prevails. Chelsea is the chosen home of Radicalism, and the members for Chelsea have been this week addressing their constituents. But those will be disappointed who expect to learn much from the speeches of the Chelsea members. The reporter described Sir HENRY HOARE'S speech by saying that he touched lightly on several topics, and no description could have been more exact. He is the butterfly of Radicalism, and no sooner has he settled on a flower than he is off again. "You could not answer argument by a joke," he informed his admirers, "but the Income-tax was the only tax of which a "man wished he paid a larger proportion; yet it was inquisi- "torial and vexatious." The butterfly was soon off again, and flew to the Game-laws, which he wished to see largely modified, but he did not want to see birds exterminated. Conservatives who are alarmed at Radicalism of this type must be very easily frightened. Sir CHARLES DILKE was of course more serious, but he evidently spoke without having taken the pains to exhaust any of the subjects of his Radical manifesto. He was opposed both to direct and to indirect taxation. He wished all indirect taxes of every kind to be removed, and at the same time he was dead against the Income-tax. On the other hand, he was for reducing the public expenditure, principally by giving up Gibraltar, which he declared would save the country a million a year. Radicals of this stamp will not, we may be sure, do much harm to any one. If any Conservatives are inclined to shudder at the proposals of such speakers, they should call to mind the very different way in which Mr. BRIGHT went to work when he led an Opposition which was really formidable. He knew his own mind; he selected a special point, worked out thoroughly what he had to say on it, and drove his points home with the full powers of rhetoric and exaggeration at his command. So long as Radicals set about their business in exactly the opposite way, make very large proposals for changes with regard to law, or property, or finance, while they avoid details and show no mastery of the elements of their subjects, the country is sure to rate them at their proper value; and the tiny pebbles they throw into the calm waters of current politics soon sink to the bottom, leaving the surface as unruffled as before.

M. THIERS AND THE THIRTY.

THE Committee of Thirty have marked out the limits within which the constitutional controversy is for the present to be confined. The Bill prepared by the Second Sub-Committee, and another prepared by M. TALLON, are to form the text of discussion, and at the meeting of the Committee on Tuesday M. THIERS contributed a preparatory criticism of the principal provisions of the two drafts. These relate to the creation of a Second Chamber, and the relations between the President and the Assembly. The Bill prepared by the Sub-Committee places the creation of a Second Chamber last in order; M. TALLON'S Bill places it first. M. THIERS holds that in point of importance it ought to take precedence, but declares himself willing to debate it either first or last. In both drafts the Second Chamber is treated rather as an element in a future Constitution than as an addition to the existing one. The third article proposed by the Sub-Committee provides that after the separation of the National Assembly the legislative power shall be exercised by two Chambers. M. TALLON'S Bill enacts that in the month which shall precede the date finally fixed for the separation, the Assembly shall provide for the nomination of an Upper Chamber and determine the mode of nomination, the duration and character of its powers, and its relations both to the Executive and to the new Assembly. As regards the relations between the Assembly and the President, the Sub-Committee propose that he shall ordinarily communicate with the Chamber by message. But the purport of his message may be to announce that he thinks it necessary to take part in a debate, in which case the discussion to which the message refers shall be suspended till the next day. As soon as the President has spoken, the discussion is to be again suspended, and he is on no account to be present when the Chamber goes to a division. Laws for which urgency has been voted must be promulgated by the President within three days of their adoption by the Assembly, unless he, during this interval, sends a message demanding a fresh debate on them. In the case of ordinary laws he may demand after the second reading that the third reading shall be put off for a month. M. TALLON'S scheme allows the President to take part in debates without the formality of a previous message, but provides that a vote shall not be taken at the same sitting, and that the President shall not be present at the division. No special provision is made in this draft for laws for which urgency has been voted. The President is to have a general suspensive veto upon all resolutions adopted by the Assembly. When this is exercised the Chamber will proceed to a fresh discussion in the ordinary course.

M. THIERS has shown himself wonderfully pliable in the presence of these two proposals. He is quite contented to postpone the creation of a Second Chamber until the close of the Assembly's term, but he pleads for two months of preparation instead of one, and for the substitution of the word "election" for the word "nomination." As regards the relations of the President to the Assembly, he decidedly prefers

M. TALLON'S plan, though he expressly says that he can, if necessary, accept the Sub-Committee's plan. Thereupon, however, with an irony not perhaps quite unintentional, he devotes the rest of his speech to an exposition of the inconveniences which will certainly follow from the adoption of either. The result of obliging the President to retire from the Assembly immediately he has spoken will be to cause many delays. Some of the most important debates arise out of amendments proposed perhaps after the President will have left. He will thus be forced to send a second or a third message announcing his intention to speak, and each time the Assembly will have to put off coming to a decision. Where questions of importance are concerned no Minister can take the place of the President, so that if even a single statement is made in debate which the President wishes to contradict, the whole machinery of a message and an adjournment must be called into play. Besides this there are some subjects upon which it is not enough for the President to make a set speech. What is wanted is such constant explanation as can be given in the course of a debate and in no other way. It is of little use for the President to speak if he must leave the Chamber without hearing and answering the criticism of which he will be the object as soon as his back is turned. If the Committee insist that the Assembly shall do nothing when the President is present, except listen to a formal argument, they will make discussion impossible. It will be for them to consider whether in making discussion impossible they will not make Parliamentary government impossible. Still, even if they push matters to this length, M. THIERS will not utterly break with them. He is so anxious to come to terms that he is willing to make many sacrifices.

In the matter of the veto M. THIERS insists on the necessity of the President being in a position to neutralize the ill effects of any sudden excitement on the part of the Assembly. The Committee on the Army Bill, for example, began by being convinced that the Prussian military organization must be imported into France, and ended by being convinced of almost the exact contrary. This process of conversion occupied a year; and, supposing the Assembly to be equally carried away by some mistaken idea, there would be the same need of time for it to come back to a sounder mind. For this purpose a delay of a month is not sufficient; there ought to be an interval of at least three months after the President has vetoed a Bill before a fresh discussion on it can begin. There must be time for the Assembly to learn the opinions of the press and of the provinces—opinions the wisdom of which M. THIERS declares that he daily has cause to appreciate—and to modify its conclusions in conformity with them.

In subjecting the proposals which the Committee are about to consider to this exceedingly frank criticism M. THIERS has probably had two objects in view. One of these is the conversion of a majority of the Committee. Anxious as the Right has shown itself to banish the PRESIDENT from the Tribune—an anxiety it must be remembered in part excused by the undue pressure he has occasionally brought to bear on the Assembly—the inconveniences of the compromise now suggested are too serious not to cause some hesitation on the part of those who meditate encountering them. The animus of a section of the Sub-Committee is shown by the fact that two of the members propose that the right of demanding a fresh discussion shall not be given to the President except when he has not spoken in the Chamber, and that the right of speaking in the Chamber shall not be given to him in debates on interpellations. M. THIERS pointed out that it is in cases of the greatest moment that the President will most desire to take part in the debate, and it is in cases where he has taken part in the debate without bringing the Assembly round to his opinion that he will most desire to delay the execution of its decision. The object of this limitation, therefore, would be to tie one or other of the President's hands at the very time when it is most important that he should have the use of both. The object of the second limitation is to make the tribune little better than useless to the President, under cover of giving him access to it. In a political point of view the discussions that arise out of interpellations are almost always of a graver character than those which arise out of Bills. The really pressing questions, whether of foreign or of home policy, are ordinarily started in this way, and to enact that the President shall express no opinion on them is virtually to exclude him from public affairs. But though there are members of the Committee willing to go this length, it does not follow that they constitute a majority of the Thirty, or that even those who do go this length may not be shaken in their determination by M. THIERS's reasoning. If there is any chance of the Committee's being influenced in the direction he wishes to lead it, the long discussion in which M. THIERS proposes to involve the members will give him every opportunity of making that chance a certainty. At all events he can hardly fail to secure his second object, which is to make an impression on the Assembly. Supposing the Committee to reject the modifications suggested by M. THIERS, the attitude of the Government, and the reasons which have led it to assume that attitude, will be known as soon as their Report is read. M. THIERS will, in effect, have secured the right of reply, because the speeches in defence of the Report will necessarily take the shape of a comment on the speeches which he has delivered before the Committee. By this means, too, the Government will have had time to press its views upon influential deputies, and to profit by expressions of opinion "in the press and in the provinces" before the discussion begins. M. THIERS's talent for Parliamentary finesse promises to stand him in good stead.

MR. MORLEY'S COMPROMISE.

THERE are signs that at the eleventh hour of the Parliamentary recess the Education League is beginning to see the difficulties which lie in the way of an unconditional repeal of the 25th Clause of the Education Act. In a speech delivered at Bristol on Wednesday, Mr. SAMUEL MORLEY admitted that, supposing the demand for repeal to be granted, it would become imperative that some means should be found of meeting the difficulty which the clause in question had been designed to meet. This is the first word, so far as we know, that any member of the League has said on the subject, which involves a recognition that new schools have to be paid for. Hitherto the programme of the League has been characterized by a simple trust in the willingness of the British ratepayer to put his hand in his purse which seems hardly justified by experience. The Government have been abused for their obstinacy in maintaining Denominational schools as an integral part of the educational machinery of the country, without any allowance being made for the possible difficulty of providing any other machinery to fill their place. The provision of a Board school in every district has been treated as the most matter of course thing in the world. It has been assumed that the excision of a word or two from the Education Act would do all that is wanted, that when the need for Board schools is created by virtue of there being indigent children to be sent to them, the schools themselves will arise as if by magic. We have again and again pointed out the unsoundness of this expectation. That a wonderful moral impulse is occasionally communicated to whole communities at once is shown by the example of the Crusades; but if the ratepayers come forward as soon as the 25th Clause is out of the way and build a School Board school wherever there is a parent who cannot afford to pay the school fee, Mr. DIXON will have proved himself a greater preacher than PETER the HERMIT. Mr. MORLEY, or, more accurately, the authors of the paper of which Mr. MORLEY made himself the exponent, are evidently beginning to feel uneasy lest the miracle which is to make stingy men liberal and poor men careless about money should not come off after all. It is a real advance to admit that the 25th Clause was designed to meet a difficulty. The common view among members of the League has hitherto been that it was inserted in the Bill out of malice aforethought. Mr. FORSTER saw his opportunity of injuring the Dissenters, and the temptation to betray his old friends was too strong to be resisted. The crime was all the more attractive because it was absolutely unnecessary. There is some significance in the choice of Mr. MORLEY as one of the four persons who should draw up the statement of the concessions which the League have made up their minds to insist on. He is not among those who would refuse Mr. FORSTER any place for repentance. Indeed he confesses that when the Education Act was under discussion he thought better of it than most of his friends did. He has seen the error of his way since then, but still he is a late convert, and if the fatted calf has been killed in his behalf, a share of it may still be reserved for Mr. FORSTER. A spirit of compromise is so valuable an element in educational controversy that we are ready to welcome the slightest evidence of its presence, and for this reason, if for no other, Mr. MORLEY's proposal deserves careful consideration.

The difficulty he has to meet is this:—Given a district in which sufficient school accommodation is furnished by Denominational schools, and a child whose parent is unable to pay the school fee; how, when compulsion has once been made

universal, is this child's schooling to be provided? So long as the 25th Clause remains and is acted upon, everything goes smoothly. The parent sends his child to the Denominational school which he likes best, and the School Board pays the fee. But if the 25th Clause is repealed, the School Board will have no power to pay the fee in a Denominational school. As regards this one child there will be an educational famine in the midst of educational plenty. Hitherto the expedient proposed by the League has been the building of a school supported out of the rates and controlled by the School Board for the exclusive use and benefit of this solitary infant. It may be admitted that there is something grand in an adherence to principle which prefers to incur an outlay of some hundreds of pounds rather than pay threepence a week to a Denominational schoolmaster for teaching a child the three R's. But ratepayers for the most part do not belong to the heroic order. They are more likely to dwell on the fact that for threepence a week the child can be educated just as effectually as for an expenditure of many hundred times that amount. The triumph of religious equality might be secured by the child remaining away from school altogether, but the Education League exists for other purposes as well as for the propagation of Mr. MIALL's theories; and this reflection has probably been instrumental in quickening the inventiveness of Mr. MORLEY and his friends. He sees that the ratepayers in the vast majority of cases would steadily refuse to build a school under the circumstances supposed, and that it would be utterly impossible to pass or work an Act of Parliament ordering them to build one. Accordingly, he suggests that wherever sufficient school accommodation is provided by Denominational schools in any school district, the School Board shall be the manager of one or more of these schools for the purpose of controlling them during the hours of secular instruction, the building to be retained for all other purposes, and at all other times, by the existing management. When this compromise is found to be impracticable, then, and then only, the School Board shall be bound to provide a new school. We have no wish to speak disrespectfully of any honest effort to devise a settlement of what is undoubtedly a serious educational difficulty. But if Mr. MORLEY will only think the matter out, he will see that there is something undignified in appealing to Denominational school managers to help him in injuring—or at all events in doing what is intended to injure—Denominational schools. We cannot possibly—he makes the School Board say—pay you for educating the children whom the law obliges us to educate. But if you will be kind enough to hand over your school to us for a certain number of hours every day, we will undertake to educate them at your expense. It is pretty safe to assume that, except in cases where the Denominational school is already on its last legs, or where the managers hold the sound but unusual view that secular instruction may be disjoined from religious instruction without any harm being done to Denominational teaching, this offer will be declined as something not much better than an insult. Mr. MORLEY perhaps hopes that the School Board will then be able to persuade the ratepayers to build a school, on the plea that the necessity arises from the perverseness and obstinacy of the Denominationalists. It is more probable that they will ask why children cannot be sent to the Denominational school for the purposes of secular instruction, and the intervention of the School Board confined to ensuring that they enjoy the full protection of the Conscience Clause.

Supposing, however, that the School Board finds some Denominational school willing to come in to its terms, or persuades the ratepayers to provide a school in which indigent children may be taught without suspicion of Denominational contamination, another difficulty may still remain. Mr. MORLEY proposes that school districts shall be enlarged—apparently for the purpose of having a wider choice of Denominational schools to work upon, and an increased area from which to raise money if it has to be raised. The result of this change will be to increase the inconvenience—which would certainly be felt in many cases even if the districts remain as they are—of children being compelled to pass the door of a school giving efficient instruction in order to go to a more distant school giving perhaps less efficient instruction. In a district containing half-a-dozen Denominational schools, one situated perhaps in a remote corner accepts the offer of the School Board. Thereupon the child of an indigent parent living in an opposite corner has to be taken away from another Denominational school with which his parent is perfectly satisfied, and made to walk six or eight miles a day in order to keep the principle of religious equality absolutely inviolate. If compulsion can be worked with this needless irritant superadded to those which unavoidably attach to it, English parents will show themselves unexpectedly patient of theoretical legislation.

UNIONISTS IN CONGRESS.

WHAT is called a Trades' Congress has this week been held at Leeds. It is composed of "delegates and members"; but the difference between a delegate and a member is not very clear. We gather from a complaint which has been made that these Congresses have not altogether fulfilled the object for which they were originally established. That object seems to have been to advertise the so-called working-men who have given up work and are now engaged in professionally representing the working classes in various forms of political agitation. Last year, however, several members of Parliament contrived to get admitted to the Congress and made speeches, which the reporters, with a shocking want of discrimination, sent to their respective journals instead of the speeches of the agitators. This abuse is now to be put a stop to, and henceforth nobody is to be invited to any of these gatherings whose oratory is likely to eclipse that of the "delegates and members." Perhaps it is just as well that we should have the plain and unalloyed opinions of the gentlemen who direct the operations of the Trade Unions on some of the questions which are just now engaging so much attention. Before we look at the arguments of the Congress, it will be desirable to examine its facts. The Report of the Council rejoices over the "victory" of the Newcastle engineers, and the establishment of the nine hours' day, and also speaks of the results of the bricklayers' and bakers' strikes in London, as if these, too, had been successful. In point of fact the engineers were not victorious, inasmuch as they were glad at the end of several months to accept the terms which were offered by their employers almost at the outset of the strike. Nor has the nine hours' working-day, in the sense in which it was demanded by the men, been established at Newcastle or anywhere else. What the engineers sought was a limitation of production; what they got was only an increase of wages. They wanted to put a stop to overtime altogether, and failed; all that was conceded was that overtime should begin to be reckoned earlier in the day than formerly, and this they could have had for the asking without a strike at all. The compromise which brought the bricklayers' strike to an end might also have been secured without an open rupture; and the bakers' strike, as everybody knows, was a failure. The report of the Congress does not appear to have contained any censure on the gas-stokers for their violation of law and reckless disregard of public interests, but several of the speakers denounced in vehement language the "cruelty and "vindictiveness" of the judge who tried the ringleaders. These are rhetorical expressions which may be usefully omitted from the discussion of the question. There is a very general impression, which we certainly share, that the sentence was too severe. A year's imprisonment is a very serious thing for a working-man who has a wife and family dependent on his labour, and a more lenient sentence might have satisfied the interests of justice. The feeling on this subject is, as far as we can judge, so strong and unanimous, even among those least disposed to sympathize with or to favour the policy of the Trade Unions, that the HOME SECRETARY might not unreasonably exercise the Royal prerogative in favour of the prisoners. The question is not a very difficult or complicated one, and there has been plenty of time even for Mr. BRUCE to make up his mind upon it. It is not desirable that the decision of the Crown on such a matter should have the slightest appearance of being due to any kind of coercion; and we cannot help thinking that the HOME SECRETARY should at once have considered the matter, and have come to some decision upon it. Whatever is done in such a case should be done as the result of a calm and deliberate conviction on the part of the Minister, and on his own responsibility, and not in obedience to clamour and intimidation.

Whatever may be thought of the severity of the sentence which was passed on the gas-stokers, there cannot be the slightest doubt that they committed a criminal act. Mr. LISHMAN, the President of the Congress, observed that "Trade "Unionists had little idea that, under the Criminal Law "Amendment Act, for the offence of leaving work without "notice they could be convicted of conspiracy." If Trade Unionists had no idea of this, it is rather important that it should be brought home to their minds. Mr. LISHMAN also said that "the time had gone by for special laws against Trade

"Unionists, and that there was no reason why they should "not come under the common law of the land"; and we fully agree with the remark. On the other hand, however, Unionists must not expect to be exempted from the operation of the common law of the land merely because it does not happen to suit their projects. Mr. Justice BRETT'S judgment, as reported, is not quite so clear as could be wished, but it is impossible to say whether this is the fault of the Judge or of the reporters. He is said to have laid it down that "a combination to do anything to cause "annoyance, or in the way of unjustifiable interference which "in the judgment of the jury would have the effect of annoy-"ing or interfering with the minds of ordinary persons "carrying on such a business as that of a gas company," was a conspiracy; but "unjustifiable interference" is a phrase which begs the whole question. What is unjustifiable interference? It is obvious that, even if notice were given in a regular way, a strike, or the threat of a strike, would have the effect of annoying or interfering with the minds of ordinary persons carrying on business. If that is a criminal conspiracy, we can only say that society is honeycombed with conspiracies. It is quite clear, for example, that the Civil Service Stores are combinations which annoy and interfere with the minds of ordinary persons engaged in the sale of groceries, and the directors, on this reading of the law, are each liable to a year's imprisonment. All kinds of manufacturers and salesmen combine for the purpose of regulating their respective trades, and especially of keeping up prices, and should therefore be prosecuted. When employers give notice of a reduction of wages, they annoy and interfere with the minds of their men just as much as the men annoy and interfere with the minds of the masters when they threaten to strike.

We are bound to suppose that when Mr. Justice BRETT spoke of unjustifiable interference he was thinking of some criminal act; and to leave work without notice, in breach of an engagement, is undoubtedly a criminal offence. There appears to be a good deal of misapprehension both as to the scope of the Trade Unions' Act and the Criminal Law relating to Violence Act, and as to the nature of the law of conspiracy. The Acts we have mentioned were passed only for the purpose of eliminating "restraint of trade" as an element of criminality. It may be assumed that it was intended to make strikes legal, and a combination to strike, supposing the strike to be conducted in a regular and peaceful manner, would therefore be removed from the category of criminal conspiracies. But the general law of conspiracy is still applicable to Unionists just the same as to non-Unionists; and whatever may be doubtful as to the law of conspiracy, it is at least certain that a conspiracy to commit a crime is a crime. It seems to have been somewhat hastily assumed that Mr. Justice BRETT was not entitled to take into account the injury to the public resulting from the misconduct of the gas-stokers. If the strike had been a regular and legal strike, the stokers could not have been held responsible for any inconvenience or injury to the public. It is absurd to say that any class of men are bound to go on working for an indefinite period at a rate of wages which they consider insufficient, simply because their leaving off work would be annoying to the public. The public has no more right to compel men to work for it against their will than any private employer. On the other hand, however, when a crime has been committed, the judge in passing sentence is not only entitled, but bound, to look at the actual and possible consequences of the crime. A strike of bricklayers without notice would be a crime, but its consequences would not go beyond a certain amount of loss to the builders, and of inconvenience to persons who might be waiting for houses. It is obvious that a strike of railway signalmen without notice in the middle of the night would be a crime of more serious magnitude. It might lead to the destruction of a vast amount of valuable property and of thousands of lives. The gas-stokers not only did not care whether the inhabitants of London suffered from their sudden desertion of their posts, but desired and intended that they should suffer, and deliberately doomed them to their fate in order that it might be the means of influencing the Gas Companies. As it happened, the stokers were disappointed, but their intentions unquestionably aggravated their crime.

The temper of the Congress was sufficiently indicated by the uproar which was produced by the President's innocent remark that, in his opinion, some of the strikes which had recently occurred were inopportune and injudicious. The observation was received with indignant cries, and the President was severely rebuked for his scepticism and profanity. It would appear that, in the opinion of the Congress, strikes are part of the sacred rites of the industrial religion, and that there is a peculiar sanctity about them which places them beyond the reach of criticism. It might have been supposed that the interests of working-men depend a good deal upon whether their strikes are opportune and judicious or the reverse, and that a friend could hardly do them a greater service than by warning them against rash and unprofitable movements of this kind. But then to hint that a strike could under any possible circumstances be injurious would be a reflection on those who arrange and direct such things, and this happens to be the very class represented at the Congress. Nobody denies that the men of any trade have a right to strike if they choose, but it does not follow that by striking they invariably promote their own interests. It is doubtful whether strikes have had the effect of raising the rates of wages; indeed there is some reason to believe that they have tended to retard the advance of wages which was gradually taking place through other causes. However that may be, it is tolerably certain that, when the loss of wages to the men and the loss of capital to the trade are fairly reckoned up, even an apparently successful strike will be found in the end to be a losing game. In the present strike of colliers in South Wales, some of the Unionists have been using their influence to induce the men in charge of the pumping-engines in the mines to withdraw. If the engines were stopped, the pits would quickly be flooded. The result would be that, when the strike was over, several months would elapse before the men could begin to earn wages, and the expense of getting the water out of the mines would of course be so much deducted from the fund at the disposal of the proprietors for paying wages and carrying on their business. Nothing was said at the Congress to show that the managers of the Unions have recovered from the delusion that whatever injures the masters must necessarily be a proportionate benefit to the men. A good deal of nonsense is daily talked and written in regard to arbitration between employers and their men. Arbitration is possible only when the quarrel has been reduced to an issue of facts, and it is probable that when this stage of the controversy has been reached arbitration will be found to be superfluous. It is evident that in South Wales the only question is which side is the stronger and has the greater capacity for endurance. The history of arbitration shows clearly enough that neither masters nor men will long submit to an adverse decision if they think they can gain anything by renewing the contest.

BYRON AND HIS WORSHIPPERS.

A CURIOUS controversy has recently sprung up in the *Times* as to the accuracy of a well-known line in *Childe Harold*. More than fifty years have elapsed since the publication of the last canto of that poem, and during that time many thousands of readers must have learnt by heart the address to the Ocean, and many hundreds at least have been shocked by the ungrammatical substitution of "lay" for "lie." It is rather odd, therefore, that the reading should now be undergoing a discussion as animated as though the flaw had just been discovered in Mr. Tennyson's last poem. It is yet more surprising to find that there are still many persons who, not content with admiring the magnificent vigour of Byron's poetry, insist upon believing that it is absolutely free from faults. One class of enthusiasts holds that "lay," being obviously a vulgarism, cannot have been written by Byron. The various readings which have been suggested are so obviously feeble, however, that this mode of escaping the difficulty does not deserve any serious notice. Mr. Murray's statement as to the authority of the MS. is conclusive; and none of the verbs which can be substituted for "lay" have any merit beyond that of being intransitive. Another class admits that Byron made a mistake, but regards it as wrong to dwell upon it. One of these gentlemen quotes a phrase from *English Bards and Scotch Reviewers*:—

> "But hold!" exclaims a friend, "here's some neglect;
> This—that—and t'other line seem incorrect."
> What then? The selfsame blunder Pope has got;
> And careless Dryden—"Ay, but Pye has not."
> Indeed!—'tis granted, faith! but what care I?
> Better to err with Pope than shine with Pye.

This is all very well; but it does not meet the case. Neither Pope nor Dryden, as far as we can remember, though we cannot pledge ourselves to maintain the negative, has made this particular blunder. Pope, indeed, not unfrequently falls into grammatical errors from an excessive love of compression; and it may be—for upon that subject we must admit our entire ignorance—that Pye does not. But then there is no necessity for "erring with Pope" because you do not "shine with Pye." The argument would be effective only against critics who should maintain that Byron was inferior to Pope because he had fallen into blunders from which Pye is free, and nobody, as far as we know, has said anything so silly. Whatever may be Byron's

merits, they surely should not blind us to his faults. He can't have faults! replies a still more enthusiastic writer. Byron is by far the greatest of English poets since Milton; and therefore we should humbly submit to any vulgarism or grammatical solecism of which he may be guilty. Byron must be regarded as an infallible being who is "super grammaticam." As the captain of a ship "makes it" twelve o'clock, so Byron's language must be taken not as recognizing, but as constituting, the law. We do not know, indeed, whether this privilege is limited to Byron himself, or whether a usage once consecrated by him is supposed to become henceforward part of the language. The extreme of fanaticism would be reached by the admirer who should continue piously to commit the same blunder as the god of his idolatry. If everybody who misplaced words could take refuge under the plea of Byron-worship, the sect would be painfully numerous. It is to be hoped, however, that the admirers of popular authors will show their enthusiasm in some other way than by barbarously mutilating their mother tongue. Precedents can be quoted from widely read books for nearly every pestilent misuse of language which is current amongst us. To take an obvious instance, Dickens did much towards hopelessly confounding the prevalent confusion between "mutual" and "common," when, in spite of protest, he insisted upon giving to his novel the title of *Our Mutual Friend*. There is always a tendency towards degeneration through the inability of the careless and ignorant to recognize the finer distinctions between nearly synonymous words, and persons who are capable of better things should do their best to resist any authority, however venerable, under cover of which attempts are made to obliterate shades of meaning. A wilful blindness to the errors of Byron, even if it does not involve the condonation of similar errors in inferior writers, is to be condemned in the interests of poetry as well as in the interest of the language itself. A poet is an artist in words; and popular readers are not aware how greatly the charm of the most exquisite poetry depends upon a fine sense of proprieties of language which they consider as finical and pedantic. The misuse of a single word may destroy the charm of a passage as decidedly as a false note in music. It is the fly in the pot of ointment which poisons the sweetness of the sentiment; the little rift within the lute which introduces a jarring note, even when we are scarcely conscious of the cause of our annoyance. To what, for example, is owing the enduring charm of such an exquisite lyric as Herrick's "Gather ye rosebuds while ye may," or of Cowper's "Loss of the Royal George"? The sentiment in each of these poems is not only commonplace, but is delightful because commonplace. The beauty of them depends upon the expression in the simplest language of thoughts which are familiar to everybody. But of course it is not enough to express common thoughts in simple language, or Tate and Brady, to say nothing of Dr. Watts, would be great poets. The quality needed is an exquisite sense of propriety in the use of words, which is amongst the rarest of endowments; and which, where it exists gives a charm, as unspeakable as it is impossible of analysis to the utterance of a truism which in less skilful hands would strike us as trite and wearisome. To maintain a high standard of excellence in poetical workmanship is therefore the main service which criticism can render to poets; and more harm would be done by encouraging laxity in such matters than even by a grudging recognition of the merits which make us unwilling to admit the existence of faults.

The controversy, therefore, may be summed up very briefly. Byron has clearly injured a fine passage by a gross vulgarism, and it is a thousand pities that it cannot be excised. But it can neither be excised nor overlooked by a critic who is faithful to his duty, and we should not consent to sacrifice the language to the interests of a Byron or even of a Shakspeare. It is rather curious to discover that Byron should still have disciples ready to propose such a sacrifice. It might have been supposed that the Byron fever was over. No writer of anything like equal power ever committed so many poetical sins for the sake of temporary popularity, and Byron committed them with his eyes open. We need not dispute the statement that he is the greatest of our poets since Milton. Our judgment will probably depend upon the relative importance which we attribute to different poetical endowments. Nothing in Byron appeals to our deepest moral sentiments so forcibly as some of Wordsworth's odes and sonnets; nor is he ever so purely and ethereally poetical as Shelley in his loftier moods; but if sheer strength of human passion, finding expression in language of corresponding vigour, gives a man a title to the highest place in poetry, it must be admitted that Byron can put forward a very powerful claim in spite of all his affectations and his brutalities. We are never in favour, however, of arranging poets in order of merit as young gentlemen are being arranged just now in the Mathematical Tripos at Cambridge. We know of no satisfactory scale which will enable us to say, for example, that *Childe Harold* deserves 1,000 marks, and the *Excursion* 999 or 1,001. But, considering how conspicuously Byron's poetry is a mixture of strength and weakness, of ennobling and debasing passions, and how even in his loftiest passages there is perceptible a false note of affectation, we should have thought that the day of indiscriminating admiration ought to be over. In the very passage, for example, which has provoked this dispute, the use of the word "lay" is by no means the worst fault. The sense of the eternal and unchangeable character of the ocean is, indeed, given with admirable power, though we might raise objections to one or two phrases. But when Byron gives a misanthropical turn to a reflection which is rather melancholy than terrible, he immediately becomes strained and unnatural. It is not a true antithesis to say that the ocean despises the vile strength which man wields for earth's destruction. Man cannot destroy the earth any more than he can destroy the sea; and the sea, so far from being a master who can, whenever it pleases, send him howling and shivering to his gods in its playful spray, is in fact a very trustworthy servant. We feel that the poet is wilfully dwelling upon the destructive agency of the ocean, and wilfully turning away from its great advantages in a commercial point of view. The power of man is shown as much in shipbuilding as in building towns; and the ocean would not have been able to "mar the spoils of Trafalgar" if it had not been helped by the English cannon. It is not necessary that a poetical argument should be bound to logical forms; but in proportion as it is palpably distorted for rhetorical purposes it necessarily loses its effect. The same sense of incongruity pursues us throughout Byron's poetry, and makes us feel that it is not the utterance of the deepest emotions of humanity, but of sentiments distorted and perverted by the irregular passions of a nature stained by more than the average allowance of corruption.

Excessive idolatry of popular writers is indeed a common failing at the present day, and in one sense it may suggest some excuse for an exaggerated estimate of Byron's poetry. As a rule, the living idols are those who receive the most unmixed incense. There are two or three authors at the present day whose merits are undeniably great, and who may very possibly deserve most that is said of them even by undiscriminating worshippers. At the same time, no reputation is quite safe till it has survived the generation in which it arose and the school by which it was fostered. We may safely say that Pope was a great writer, because admiration for much of his work has remained in spite of his dethronement from poetical supremacy. But the all-swallowing devotion to modern writers is not only rash, in so far as it is premature, but it is almost certainly wrong in many points, because it insists upon overlooking the defects of its idols. We may say with considerable confidence that certain writers have obtained such a position that whatever they write is certain to be received with a chorus of adulation. There may be an undercurrent of disapproval gradually accumulating, and calculated, it may be, to produce an exaggerated explosion whenever it becomes safe to give it a vent. But at present any hint that there are spots upon certain suns is received as a proof of the mean jealousy of the observer, and he is summarily ordered to hold his tongue. Poor Byron suffered in his day from excessive adulation and the recoil from adulation. By this time we might have hoped that a calmer judgment would have succeeded. It seems, however, that the zeal for his honour burns as brightly as ever in some bosoms, and one reason is that his fame is felt to provide a convenient counterpoise to the fame of the idols who are now most fashionable. To praise Byron is by implication to accuse certain modern writers of defects from which Byron was comparatively free. In fact, our modern school of poets is weak precisely where Byron was strong. With all his affectations and his weaknesses, he did not fall into the errors of namby-pambyism; and he at least made a protest—an exaggerated and a brutal, but still a very effective, protest—against the adoration of mere prettiness, which is so fatal a defect of our most recent school of art. "There are chords in the human heart," said poor Mr. Guppy; and we may add that there are passions, though we frequently try to ignore the fact. Some of our poets seem to write for the benefit of young ladies, and to be ambitious chiefly to lie upon drawing-room tables; others seek to please small literary coteries, and lisp with affected simplicity in archaic costumes; and some who boast of shocking the proprieties only succeed in being indecent without showing the masculine vigour which alone can be a partial excuse for neglect of conventional decorum. Byron is the last of our poets who, with all his faults, can be said to have written for grown-up men, and to have made passion, instead of refined speculation, the motive power of his poetry. Perhaps it is natural that, when looking back to his writings from more sickly and academical performances, his merits should be unconsciously over-estimated. But, for all that, the sacred rules of truth forbid us to sanction the use of "lay" for "lie," whatever the ingenuity of the excuses put forward in its favour.

MR. HERBERT SPENCER'S REALISM AND BERKELEY.

IT is the commonest reproach of speculative intellect that it destroys more than it constructs. Whatever truth there may be in this in a general way, it is certain that the very opposite tendency is sometimes to be found in minds of great calibre. One such instance, we think, is now conspicuous amongst us in the person of Mr. Herbert Spencer. The constructive power shown in his works is unsurpassed in this generation. In deep and far-reaching insight, in co-ordinating seemingly scattered facts, and in harmonizing seemingly diverse results, he has no superior. But when he leaves the building up of his own ideas and goes about to demolish others which stand, or which he supposes to stand, in the way of his intended course, Mr. Spencer becomes a different person. As a constructive philosopher he is great; as a critic of philosophy he is liable to be even as other critics.

This duality or disproportion of Mr. Herbert Spencer's thought has perhaps never come out so clearly as in the lately issued

volume which completes the *Principles of Psychology*. In the part entitled "General Analysis" he examines the theory of knowledge, and in the course of that process he undertakes to confute idealism, which he thinks to be necessary in order to ensure the safety of his positive results. He chooses Berkeley's doctrine, or rather the not uncommon misconception of Berkeley's doctrine, as a sort of representative enemy, and spends some time in attacking it in detail. It is fortunate that Mr. J. S. Mill * and Professor Huxley † have not long ago given clear and trustworthy accounts of what Berkeley really taught. For these controversial chapters of Mr. Spencer's book are, in our opinion, likely to give a very misleading notion of Berkeley's thought to readers who have not already formed an accurate one. Mr. Mill most truly says in the beginning of his essay that Berkeley's adversaries have generally occupied themselves in proving what he never denied, and denying what he never asserted. And this seems to be in a great measure the case with Mr. Spencer. He does not confute, or even fairly meet, that which Berkeley in fact held concerning matter. On the other hand, Berkeley's real doctrine, as far as its negative part goes (the only part that now concerns us), is consistent enough with Mr. Spencer's results, though it is not consistent with the language in which they are expressed.

At the outset of the discussion, in announcing that "we have to take up the vexed question of subject and object," Mr. Spencer says that, "should the idealist be right, the doctrine of evolution is a dream." If "the idealist" means Berkeley, this is striking a false note already. The doctrine of evolution is a scientific theory which has for its object the explanation of phenomena—that is, the interpretation of things such as they appear to us in terms of other things such as they do or might appear to us. "To explain the phenomena is to show how we come to be affected with ideas in that manner and order wherein they are imprinted on our senses," says Berkeley's Philonous in the Third Dialogue between Hylas and Philonous, where this difficulty is anticipated and answered. The ascertaining of order and connexion amongst phenomena is independent of the question whether we are to say that the phenomena, order, and connexion which we know are supported by, or correlative to, something which is not to be known. To use an illustration somewhat in Mr. Spencer's own manner, we may possibly doubt whether a diagram we see on a screen be a figure actually drawn on the screen or a projected image. But this doubt makes no difference in our certainty as to the geometrical properties of the figure. Accordingly we do not see how it is either necessary or relevant for Mr. Spencer to stand forth as a champion of the natural belief of mankind, even on the assumption that what he defends really is the natural belief of mankind. This, of course, amounts to saying that we consider the value of what he has to say about the Knowable to be independent of his doctrine about the Unknowable, so that they need not stand or fall together. We cannot now show cause for this position at large; but it is well to explain clearly that we do hold it, and therefore feel at liberty to treat the chapters now in question as an excrescence on the general plan of Mr. Spencer's work.

However, Mr. Spencer has persuaded himself that the fundamental assumptions of philosophy must be secured by a counter-attack on the metaphysicians, which he calls the negative justification of realism, and so he attacks them one and all. He begins by charging them with excessive confidence in reason, and with setting up reason against perception when they cannot prove, and have no business to suppose, perception less likely to be right. But there is in truth no question of a "trial of Reason *versus* Perception." The object of Mr. Spencer as well as of those from whom he differs is to employ reason, not to contradict perception, but to find out what it really is and what it means; a process which doubtless involves the contradiction of various confused notions as to what it is that we perceive. We have to decide, not whether to believe or disbelieve the evidence of our senses, but which to choose amongst rival interpretations of their evidence. If any one sets up reason against perception, it is not Berkeley, who over and over again asserts the reality of perception:—

> Do I not know this to be a real stone that I stand on, and that which I see before my eyes to be a real tree? . . . To be plain, it is my opinion that the real things are those very things I see and feel, and perceive by my senses. . . . A piece of sensible bread, for instance, would stay my stomach better than ten thousand times as much of that insensible, unintelligible, real bread you speak of.

And the vindicator of perception is Mr. Spencer, who may "call for pen, ink, and paper, like another man," to write its defence, but what any one of them is in its own true nature he declares positively he knows not ‡, only that there is an unknowable reality under these changing shapes. This seems to us to be, not defending perception, but setting up something, be it reason or unreason, in flat contradiction to perception and to the author's own warning that "reason can do nothing more than reconcile the testimonies of perception with one another."

Then the metaphysicians are accused of speaking in words which all the time protest against the thought by their implied meanings; and the conclusion is, that "language absolutely refuses to express the idealistic and sceptical hypotheses." Now this, if made out, would prove nothing or too much, for the same may be said of an immense amount of undoubted mathematical truth. And if the objection were sound, thought and language would be fast bound to one another, and neither could ever advance. But the verbal criticisms adduced do not make out the proposition. Mr. Spencer first takes Berkeley's sentence: "By sight I have the ideas of light and colours," and elaborately entangles it by such considerations as that sight involves an eye, and the eye itself involves ideas of colour, and so on. But overmuch zeal for the fundamental relation of subject and object has led here to a confusion between the subjective and the objective way of looking at things. Speaking subjectively, my own sight, as a "vivid manifestation" (in Mr. Spencer's phrase), does not necessarily involve an eye, though it does involve certain elements of the kind called muscular sensations, which do in fact, but quite otherwise than in the act of sight, come to be known as correlative to an eye. I might see very well, though I had never seen the reflection of my own eye, nor an eye of any other creature, nor knew that there was such a thing in nature. Speaking objectively, on the other hand, sight, as an optical or physiological phenomenon to be explained, does involve an eye. But that is another matter, and is foreign, as we conceive, to Berkeley's intention in this sentence, which is, as reference to the context shows, to restrain the meaning of *sight* to subjectively considered "ideas of light and colours." As between subject and object the organism is not a medium, but part of the object. Why is Berkeley worse off when he says our "sensible body, rightly considered, is nothing but a complexion of such qualities or ideas as have no existence distinct from being perceived by a mind," than Mr. Herbert Spencer when he says it is a certain portion of the "vivid aggregate" correlated in a peculiar manner to the "faint aggregate" of manifestations—that which is manifested and that to which it is manifested being alike in themselves unknowable?

A second puzzle is made out of Hume's use of the word *impressions*. I walk gradually up to a man, at first too far off to be distinguished, till my eye is close to one button of his coat, and I see no more. In all this series of changing states of consciousness, what is my visual impression of a man? asks Mr. Spencer; and from paradoxical answers he finds refuge in "something that impresses and something that is impressed." But there is no single or comprehensive "visual impression of a man," unless we choose to give that name not to the phases themselves, but to the continuous relations amongst them. "The state of [vivid] consciousness existing at any moment during the time in which consciousness is undergoing these changes" is accompanied by the remembrance of past continuous variations and expectation of other continuous variations to come. It will be found that attention to this point removes the supposed difficulties by supplying the continuity and permanence which Mr. Spencer thinks himself driven to seek in two independent and incomprehensible existences. As to the question: At what stage between seeing the whole man and seeing only a button does the impression cease to be the impression of a man? it is a mere verbal puzzle. What we mean by seeing a man is seeing enough to infer a man from (how complex the inference is Mr. Spencer has himself pointed out elsewhere); and how much is enough depends on the circumstances in each case. A sentry who shoots at the gleam of one button in the dark may say he has seen the enemy, if the result shows that the button was on a coat, and an enemy inside the coat.

Moreover, the "something that impresses and something that is impressed" explain nothing. As they are in themselves unknowable, so are the relations between them; and we are at a loss to see how impressions or anything else are the more intelligible for being referred to unknowable relations between unknowable existences. "How is it possible," asks Berkeley, "I should be assured of the reality of this thing, which I actually see in this place, by supposing that some unknown thing, which I never did or can see, exists after an unknown manner, in an unknown place, or in no place at all?" And he amply shows, not merely that this "something which impresses" explains nothing, but that no intelligible notion of its existence can be framed.

From "The Words of Metaphysicians" Mr. Herbert Spencer passes to "The Reasonings of Metaphysicians," and makes against Berkeley in particular the charge of unfairly using the facilities of imaginary conversation. This accusation is startling. Our belief has always been that Philonous deals with all the objections which were known in Berkeley's time—not to say that he anticipates most that have occurred since. In reading Ferrier's eloquent and acute developments of his position one is constantly forced to observe how difficult it was for the most zealous and clear-sighted follower to do more than develop what the leader had laid down. But, at all events, Mr. Herbert Spencer's instance of evasion is not happily chosen. The question and answer he objects to are these:—

> PHIL. Is your material substance a senseless being, or a being endowed with sense and perception?
> HYL. It is senseless without doubt.

He says Hylas might have brought Philonous to a stand by answering either that material substance is a being endowed with sense and perception or that he cannot say. Now either of these answers, so far from doing Hylas any good, would only hasten his discomfiture. The first would be a jump to Berkeley's ultimate conclusion, that all permanent existence is in the divine mind; the second would at once concede, what Hylas is afterwards driven to admit, that when he speaks of matter he knows not what he means. We have no space to discuss Mr. Spencer's continuati

‡ See Hylas and Philonous, Third Dial. *init.*

of the dialogue as it ought to have been; but it appears to us to involve a fallacy which the author in his better judgment would be the last man to be deceived by, the confusion of the meaning of a name—to wit, material substance—with the reality of the thing denoted.

There are other arguments against idealism, all resting on the same fundamental misconception, as we cannot but deem it, of what idealism really asserts. We note, as a specimen, the "argument from priority":—

> Up to a considerably advanced stage of his mental development, every one thinks of properties, not simply as implying objects, but as being objectively what they seem to him subjectively. . . . Even the metaphysician, perplexed by involved reasonings, will not fail to remember that originally he regarded colours as inherent in the substances distinguished by them; that sweetness was conceived as an intrinsic property of sugar; that hardness and softness were supposed actually to dwell in stones and in flesh.

Even so; but this belief, which Mr. Spencer calls realistic, is the very stronghold of idealism, or at any rate immaterialism. This is just what Berkeley contends for, that the common voice of mankind has nothing to say about any occult reality of things as distinct from the sensible things. It is Philonous, not Hylas, who cannot for his life help thinking that snow is white and fire hot, and points out that if you ask the gardener why he thinks yonder cherry-tree exists in the garden, he shall tell you, because he sees and feels it. It is the idealist whose philosophical thought justifies his natural thought, and who refuses to separate the objective from the subjective reality of things; it is the realist who asserts that things are not objectively what they seem to him subjectively, and who shocks the common voice of mankind—which says, so far as it says anything, We perceive the thing itself by "vain multiplication of logical barriers between our intelligence and the thing which we suppose ourselves to know."*

All this while we are not distinctly told what is the realism which is to deliver us from the metaphysicians. However, before Mr. Spencer proceeds to his "positive justification," he makes an earnest appeal to the contemplation of a reader who has cleared his mind of hypotheses. The reader is to look at the book, and take note of his unprejudiced consciousness. The result is the recognition of the book as an external reality: "he finds that he is conscious of the book as existing apart from himself." Is this realism? It is surely consistent at least with any form of idealism which is not absolutely egoistic. Existence and external reality are not denied; the true question is, What do we mean by existence and external reality? and this is persistently evaded by Mr. Herbert Spencer's dialectic, though his analysis furnishes excellent materials for arriving at a right answer. We shall demur, indeed, to the supposition that the external reality of the book whereof our consciousness informs us is the reality of a "transfigured," unseen and invisible, unknown and unknowable book. We can only repeat with Berkeley that our consciousness tells us of no such thing, and we refuse to entertain it, not "merely because we have no notion of it, but because the notion of it is inconsistent; or, in other words, because it is repugnant that there should be a notion of it." Mr. Spencer never shows, indeed he never fairly addresses himself to showing, that the notions of external reality and existence do not indissolubly involve subject as well as object, thought as well as things. It is said later that Berkeley never succeeded in expelling the consciousness of external reality: the answer is plain—he never desired to expel it.

This critical part is followed by the "positive justification," which consists in showing that the antithesis of subject and object is a product of "normal acts of thought, like those which establish the truths we hold most certain." As this antithesis is not denied by idealists generally, and by Berkeley is especially insisted on, we have no occasion to dispute the analysis of experience into which Mr. Spencer enters for this purpose. Here he is in his proper element, and his observations on the differentiation of subject and object are full of valuable and suggestive matter, the more valuable, perhaps, for being expressed in fresh and unfamiliar terms. The investigation brings out these conclusions:—

Material substance is an "unknown correlative of the vivid state we call pressure, symbolized in the known terms of our own efforts."

That which persists or exists is the *nexus* of the ever-varying appearances of an object.

The conception we have of matter is one which unites independence, permanence, and force.

In all this we see nothing contrary to idealism. To deny that the correlative elements of all experience can be sundered in thought, which is idealism, is a different thing from asserting that one of them has no correlative; in fact it implies the correlation affirmed by Mr. Spencer. Idealists do indeed find an incongruity in speaking of one correlative as unknown when they mean that, apart from its constant correlation with the other, it cannot be the subject of any knowledge, human or otherwise; or in talking of the incapacity to know in a manner contrary to the nature of all possible knowledge as a limitation of human faculties. As to the permanent *nexus* in sensible appearances, it is fully admitted. Mr. Mill in his exposition of Berkeley has been very careful to set this forth, and to show how it agrees with idealism; and as to force, which is so much a subjective notion that some physicists wish for scientific purposes to be rid of it altogether, it is hard to see what aid or comfort it can give to the material substratum.

Again, Mr. Spencer establishes the antithesis of subject and object by exhibiting, as the result of his analysis, two approximately parallel series of states of consciousness, which he calls the "vivid" and the "faint aggregate," relatively coherent in themselves, and incoherent with one another; a sense of internal power associated with changes in the subjective series; and a consequent idea of external power associated with changes in the objective series. But what, if anything, does this prove? Only that the individual consciousness is not wholly self-determined.

At length we come to the realism which Mr. Herbert Spencer set out to vindicate, giving us to understand that he was doing battle for the actual beliefs of mankind against philosophers. What, then, do we find? "Is it the realism of common life—the realism of the child or the rustic? By no means." A diagram is given, showing the figure or shadow of a cube projected on the surface of a cylinder, so that "the cube stands for the object of perception; the cylindrical surface stands for the receptive area of consciousness; the projected figure of the cube stands for that state of consciousness we call the perception of the object." Only it is not observed that the cube, the surface, and the projection alike are all the while related to the consciousness of the reader, which prevents the illustration from rising beyond ingenious illustration to any real analogy. But, to pass this by, what has become of the natural belief of mankind in the reality of the things they know? It is rejected under the name of Crude Realism, and the Transfigured Realism which takes its place affirms that "the projected figure [*i.e.* the thing as perceived] contains no element, relation, or law, that is like any element, relation, or law, in the cube [*i.e.* the thing in itself]." And this is the belief which is propounded as so clear and certain that opposite beliefs have never been held at all, and are propositions of which the terms cannot even be brought together in consciousness. This doctrine, which begins with denouncing the pride of reason in the name of perception, and ends with subduing perception to faith in an unknowable reality utterly unlike what is apprehended—is it rightly called transfigured realism, or is it rather a pseudo-realism?

It is this kind of striving after substrata, realism, and things in themselves which really forces together incompatible terms. The would-be realist seeks to arrive by reason at an existence independent of thought. The idealist, constantly misunderstood and scouted as a visionary, protests that the search is chimerical, for the notions of *existence* and *independence of thought* are incongruous and mutually repugnant, and cannot stand together. And the protest has never been effectually set aside.

MAD DOCTORS.

FOR some time past the mad doctors have been chiefly engaged in assisting murderers to escape the penalty of their crimes. A case which has just been decided by the Judge of the Probate Court exhibits the experts in insanity in another sphere of mischievous activity. Sir J. Hannen has come to the conclusion that the late Mr. Holme, who had a bad habit of swearing at lodging-house keepers and excursionists, and who had also doubts as to the honesty of shopkeepers, was not insane. It would indeed have been rather amazing if the judge had decided otherwise. If Mr. Holme was mad, there must be a vast number of mad people up and down the country who ought certainly to be locked up. We have before referred to the curious issues raised by this case as to what constitutes insanity, but we wish now to call attention more particularly to the medical evidence and the process by which a theory of insanity is constructed by professional experts. Mr. Holme was a bachelor with a considerable amount of property, which at his death he bequeathed to a number of charitable institutions. He had a sister who was very well off, and with whom he was on bad terms because she had accused him of tampering with their father's will; and he seems to have thought that he was under no obligation to leave her anything. The will was disputed on the ground that the testator was a lunatic, and the evidence of his lunacy was mainly supplied by the landladies with whom he had lodged, and by three mad doctors who had never seen him, who had never even heard of his existence until they were summoned to bear testimony to his insanity, but who, having heard or read the evidence of the landladies, were ready to go into the witness-box, one after the other, and swear that they were quite sure the old gentleman must have been mad.

This method of attempting to prove insanity strikes us as a remarkable example of division of labour. There is a Yankee story of a tree which was so very tall that it took two men and a boy to see to the top of it. One man looked as far as he could, the next began where he left off, and the little boy finished the job. In Mr. Holme's case the old women and the doctors seem to have set to work in a similar fashion. Where the old women left off the doctors began. They looked as hard as they could, and they were successful apparently in seeing all that it was desired they should see. The old women were not scientific. They knew nothing of the morbid phenomena of intelligence, or obscure diseases of the brain, or fine distinctions between amentia, dementia, and delusion. They left that for the doctors, who, however, were rather shy of giving a precise name to Mr. Holme's

form of insanity. It is clear that the old gentleman was not popular with the landladies, and we can hardly wonder at it. He distrusted their honesty, he disparaged their cookery, and he cast aspersions on their sex. One of them felt this treatment so keenly that she doubled his rent. He occasionally drank too much brandy and water, and he seems to have spent the leisure of his old age in saying of his fellow-creatures what David said of them in his haste. He had a low opinion of the morality of the people of Ramsgate and of Islington, where he alternately lived; he used to wish the excursionists at the bottom of the sea, and he had been known to swear at the omnibuses in the City Road. This wicked frame of mind perhaps sufficiently accounts for his having spoken disrespectfully of Mr. Gladstone and the Government. An expert in obscure disorders of the brain might perhaps find scope for a good deal of curious research if he were to investigate the ideas which gossiping landladies are apt to form of their lodgers, above all when the lodgers are fidgety old gentlemen who swear at them. The relations between landladies and lodgers, especially in an overcrowded watering-place, are not of the kind which invariably tend to pleasant and cheerful intercourse. It is easy to understand that the late Mr. Holme was not a nice person to have to do with. He was morose, sour, distempered; he took strong views of most things, and expressed himself in violent language; he disliked noise and company, and a very little thing put him out. His landladies depicted him as a perfect ogre, though they could not quite agree as to the details of horns and hoofs; and very little knowledge of human nature is required in order to perceive that their bold, free style of portraiture must be taken with considerable qualification. As the doctors who were called to speak to Mr. Holme's insanity had never seen him, they could tell nothing from their own personal knowledge. They could only say that, assuming the landladies' stories to be true, there was reason to suppose that Mr. Holme was out of his mind. The Judge observed that, if science had arrived at such a pitch that a person by reading letters and hearing evidence could say that a testator had a particular disease, he supposed he must admit it for what it was worth. Perhaps the best way of judging of its worth will be to quote some specimens of it.

One of the doctors was greatly impressed by the character of Mr. Holme's letters. There was, he said, very little in them. They were written in an involved, clumsy style, and contained few ideas. They were all about the weather and the crops, and his own health, and his sister's and brother's health, with a little about politics occasionally. We should think that this is a very fair description of the correspondence of a vast body of our countrymen when they are writing, not on matters of business, but to friends. Even in our day great men have been known both to write and speak in an involved and clumsy style. Mr. Holme sometimes used unbecoming language. He spoke of "blear-eyed Jews," and deplored their admission to Parliament; but, as the Judge remarked, he was not singular in this aversion. One of his reasons for forming a low estimate of humanity was that the people he met were always grumbling about the weather; for his own part, he said, he had no doubt that wet weather and dry weather were both good in their way. This passage was not cited, however, as a proof of violent mania. The doctors insisted upon taking all the violent expressions attributed to the testator in a strictly literal sense. When he complained of his food, and said it was enough to poison any one, it showed he was labouring under a chronic delusion that there was a conspiracy to take his life by mixing poison with his food. When he swore at the rabble who came down to Ramsgate in the steamboats, and wished they were all at the bottom of the sea, here was homicidal passion sure enough. It was said to be impossible that a person of sound mind could utter such imprecations. It appears to be a rule with the doctors to assume that everybody who uses bad language must mean exactly what he says, and that a hot-tempered, vulgar, ignorant old man, when he vents his impatience in curses, has carefully measured his expressions, and desires their literal fulfilment.

There seems to be no doubt that Mr. Holme occasionally talked loosely and incoherently, especially when he was "muddly" of an evening after his brandy and water, and that he was nervous, excitable, and odd in his ways. On the other hand, he managed his affairs during his lifetime shrewdly enough. Although he was furious in his language, he never struck at any one or attempted to do any one any harm; he subscribed to various benevolent societies; and he gave full, accurate, and perfectly lucid instructions with regard to his will. But all this did not in the least affect the medical theory of his insanity. His rational and sensible behaviour in matters of business appears to have been regarded by the doctors as a natural, if not necessary, incident of his insanity, and rather a confirmation than otherwise of his hopelessly deranged condition. There was nothing extraordinary or outrageous in Mr. Holme's disposal of his property, and a man who has always shown himself capable of managing his affairs during his life might not unreasonably be assumed to be capable of making a will. One of the symptoms of insanity which were pointed out was the want of natural affection for his sister, who had charged him with dishonesty in regard to their father's will. Possibly this is not the first time in the history of the world that a brother and sister have quarrelled about a will, and there would seem to be about as much reason for imputing insanity on the one side as on the other. Indeed this is the beauty of this kind of medical evidence. It can be adapted to any case. Take any irascible, fidgety old lady or gentleman, rake up all the wonderful stories and tittle-tattle of landladies and maid-servants as to their odd ways, and the experts will do the rest. The basis of their science is that sane people are invariably rational, and never say or do anything without a good reason. To be irrational is to be mad. On such terms there are few indeed who could hope to pass safely through such an ordeal.

Mr. J. S. Mill has observed that there is something both contemptible and frightful in the sort of evidence on which attempts are sometimes made to get a man judicially declared unfit for the management of his affairs, or to upset his will if there is enough property to be worth fighting about. This time, it is true, the mad doctors have had the worst of it; but it is not comfortable to think that experts are to be found who are willing to join in an attack of this kind. It would not perhaps have made much difference to the world which way Mr. Holme's property had gone. What strikes us as the most serious aspect of the matter is that the services of experts might have been sought for to attack, not the disposal of his property after death, but his personal freedom while alive. Here are three doctors who feel quite sure the man was mad. The Judge decides that he was perfectly sane. But in the lifetime of the testator the signature of two of the three doctors might have been enough to shut him up for the rest of his days. It is often said that lunacy is spreading. We do not know how that may be; but at any rate there is one form of insanity which is evidently getting worse and worse, and that is the morbid delusions of the mad doctors themselves. They seem to be very much in the position of the poor gentleman who thought that all the people in the world were mad except himself. There is nothing which their morbid and distempered imaginations will not pervert into evidence of raging lunacy. Their conduct betrays all the familiar indications of mental disorder—suspiciousness, brooding over one idea, violent language, exaggerated expressions, repetitions of unmeaning phrases. It is time perhaps that the weapons which they use against the peace and order of society should be turned against themselves. If a grand commission *de lunatico* were held on the experts, their evidence against each other would probably be sufficient to justify their all being locked up out of the way. The doctors who gave evidence in this case are no doubt honourable men who firmly believe all they said. It is only their science, or what they choose to call science, that we have any quarrel with. Nobody doubts that the symptoms of insanity are various in character and degree, and that there are many persons hovering on the border-land between sanity and madness. It is impossible, as the Judge said, to draw a distinct and definite line which shall determine exactly where sanity leaves off and insanity begins, just as it is impossible to say when the day ceases and the night has come. All that can be positively said is, that at a certain point the darkness of night has certainly fallen. But it is just because these questions of sanity are so delicate and difficult that the public has a right to expect that professional men should be careful, in the interests of science and for the dignity of their profession, as well as out of regard for social security, not to offer rash and hasty conclusions, especially when they have nothing better to go upon than the gossip of silly old women! There is no occasion on which the most skilled and experienced men are so liable to fall into error as in attempting to decide whether eccentric or outrageous acts are due to cerebral disease or simply to want of moral self-control. It is necessary, therefore, that great caution should be exercised in forming opinions on questions of this kind, and especially in acting upon them. It is not enough even that there should be scientific grounds for assuming insanity to exist. There are certain broad considerations of expediency and public policy which cannot be left out of account. It does not follow that, because a man is suffering from cerebral disease, he is therefore to be held absolutely irresponsible for his acts; and, on the other hand, a mad person who during his life does no harm to himself or others, and whose eccentricities are not more serious than those of many people who are accounted sane and rational, is entitled to the ordinary freedom of a citizen in regard to the management or disposal of his property. A well-known writer on cerebral disease complains of the inconsistency of public opinion on questions of this kind. An attempt to prove sanity and mental capacity at a Commission of Lunacy with the object of preserving intact the liberty of the subject is applauded, while any endeavour to excuse, on the plea of insanity, the crime of some unhappy wretch alleged to be an irresponsible lunatic is denounced as an unjustifiable interference with the course of justice. He also observes that an ordinary jury is incompetent "to estimate the delicate colouring, tints, and shades of the ever-varying phases and degrees of disordered and unsound mind." It may be admitted that a jury of mad doctors would have a quicker eye for the delicate colourings of insanity, but popular instincts or this matter are perhaps a safer guide in the long run. Individual liberty and responsibility are essential to social order, and there is danger in whatever tends to weaken or disturb them.

THE CORRESPONDENCE ON DOOMSDAY IN THE *TIMES*.

EVERY thoughtful observer of things must have remarked that there has not been of late the usual abundance of those passing strange leading articles in the *Times* which have in other days caused us so much merriment. Into the cause of the change we do not presume to pry; but the fact is there. But, instead of leading articles, there has come during the last

fortnight a correspondence of the most grotesque kind, which fairly makes us wonder at the strange sort of people which there are in the world. A number of persons have been disputing about Domesday Book, most of whom at least have plainly never read a page of Domesday Book itself. A sort of free light seems to be going on among the unlearned, while the learned seem to be folding their hands to see what the thing really will come to. Of course it is the old story; mere ignorance is by no means necessarily a fault: the fault is when people sound a trumpet before them that we may come and see how ignorant they are. We should neither blame nor wonder at the first man whom we met in the road if he knew nothing about the nature of Domesday or the events of the reign of the Conqueror. The fault and the wonder is when people so needlessly proclaim to the world that they know nothing about it. Herein lies the difference—a wise man keeps his ignorance to himself; a foolish man writes to the *Times* to show it off.

Towards the end of last year there appeared in the *Times* a harmless, but not very striking or intelligent, article on the Public Records. Its writer said somewhat of Domesday, and remarked, as many people have remarked before him, that the four shires of Northumberland, Durham, Westmoreland, and Cumberland are not included in the Survey. That Lancashire also is not included in the Survey the writer did not mention, but he put on record that the cause of the omission of the other four shires was "unexplained." We can quite understand that the thing might seem a little puzzling to one who had never worked at Domesday or the age of Domesday, but who had just got up the matter for the nonce to write an article on the Public Records. The real explanation is of course not very difficult. Durham and Northumberland—Northumberland in the modern sense which had then lately come into use—must have been left out because in the great ravaging of the North they had become still more utterly wasted and worthless than Yorkshire itself. The ravages of William himself in the winter of 1069-1070, the several inroads of Malcolm, the vengeance taken by Odo after the murder of Bishop Walcher in 1080, must among them have left very little in those parts which was worth surveying. As for Lancashire, it had as yet no being as a separate shire; the Ribble divided Yorkshire and Cheshire, as ages afterwards it divided the dioceses of York and Lichfield. Cumberland and Westmoreland had also no being as English shires. The southern part of the modern counties formed part of Yorkshire, and it is surveyed in Domesday as such. It is for local inquirers to trace the exact frontier, but there can be little doubt that it would be found to agree pretty nearly with the frontier of the ancient diocese of York. The northern part of modern Cumberland and Westmoreland, including the city of Carlisle, or rather its site, did not become part of the kingdom of England till the reign of William Rufus, who in 1092 drove out Dolfin and restored the city. This Dolfin seems to have been a member of the old princely family of Northumberland, and he must have held the country under Scottish over-lordship. The country had been held by the Scottish Kings as a fief ever since the grant by Edmund the Magnificent, on the final overthrow of the old kingdom of Strathclyde. But it was only under William Rufus that it became an integral part of England. The boundaries of his conquest are no doubt represented by the boundaries of the ancient diocese of Carlisle. The notion that this country was conquered by William the Conqueror in 1072, which was held by Sir Francis Palgrave when he wrote the History of the English Commonwealth, comes only from a confused and blundering passage in the compiler known as Matthew of Westminster, who has clearly confounded William Rufus and his father. The mistake was pointed out by Lappenberg, and it was not repeated by Palgrave in his later work. That is how the case now stands. Cumberland and Westmoreland are not entered, because part of the districts now so called was not part of William's kingdom. Those parts of the modern counties which then formed part of Yorkshire are entered in their proper places. Durham and Northumberland are left out for some cause which may be called "unexplained," but which can hardly fail to have been because they were not worth entering.

All this is plain enough to those who go either to the original writers or to their latest modern interpreters. But a crowd of people seem to have been seized with an uncontrollable impulse to make guesses about the matter, and to send those guesses to the *Times*. Of course they all live in the accustomed bondage to the modern map, and cannot understand that Cumberland, Westmoreland, or anything else, can have had different boundaries then from what they have now. The one who leads the onslaught is the finest of all. He appears in the *Times* of January 7th with the date of Edinburgh and the signature of "X." The letter is worth preserving in full. There is something so charming in the confidence of a man who has seemingly never read a word of the authentic history of William's Northern conquests, and who fancies that Seward was a king, and that he lived on into the reign of William:—

> An article appeared in the *Times* on the subject of "the Public Records," in which you mention that for some "unexplained" reason the counties of Northumberland, Cumberland, Westmoreland, and Durham do not appear to be included in *Doomsday Book*. I believe the reason is that these counties were not conquered by King William. At that period Scotland was under the sovereignty of Malcolm Canmore (the Malcolm of Shakespeare and successor of Macbeth). The Scottish histories relate that while the conquest of England by William was in process the King, or Earl, of Northumberland, Seward (who was grandfather of Malcolm of Scotland), added his whole force to that of his grandson, and the further progress of William was stayed. It is also added that three great wars were engaged in, in which every effort was made by William to gain more ground, but in vain. Finally, an agreement was entered into, in which it was arranged that the boundary of the two kingdoms should be at Stanmore, a little to the south of the county of Durham, where a stone cross was erected as a landmark, bearing the effigies of the two Sovereigns:—
>
> The ancient cross of Stanmore,
> In northern neuck of Yorkshire,
> Had statues twain in armour;
> At South was England's conqueror,
> At North was Malcolm Canmore.

For this he is on January 9th very properly taken to task by one who signs himself "H.," who is "sure that the *Times* cannot wish English History to be falsified" "on the sole authority of some doggrel, the source of which 'X.' does not give us." "H." exclaims, with some simplicity, but with much truth, "Surely the Bishops of Durham were always English Bishops." And he reminds "X." of the obvious fact that "Malcolm Canmore was killed at Alnwick while invading Northumberland." He has also a "belief" about the homage of Cumberland, a little hazy perhaps, but still comforting after the nonsense of "X." Altogether "H." is very well as far as he goes, only his notions savour a little too much of the light of nature. "X." however is not satisfied, and we get him again on January 13th with another charming piece of simplicity:—

> In reference to a letter signed "H.," I have to say that the Cathedral of Durham was founded by King Malcolm, and there may be records showing whether the whole, or only a part, was built by him. I subjoin extracts from *Buchanan*, one of the most learned of the Scottish historians.
>
> He says that Edgar, to whom the Crown of England belonged, having obtained refuge in Scotland, William demanded that he should be given up. This Malcolm refused. "On this a war ensued between the Scots and English, wherein Siward, King of Northumberland, took part with the former." On the defeat of William's first army the Earl of Gloucester was sent with a larger force, but with no greater success. At length Odo, brother of William, came north with a still more formidable army, committing great ravages in Northumberland, but could make no head against the northern forces.

The notion of Malcolm founding Durham Cathedral of course comes from the passage of the Northern interpolator of Florence—whom, notwithstanding the criticisms of Mr. Hodgson Hinde, we still wish to believe in, and to call Simeon of Durham. According to this account Malcolm was present at, and took a part in, the ceremony of laying the first stone. But there is something grotesque beyond measure in the notion of searching for records to find out how much of the existing church was built by Malcolm, when, first, he was killed in the same year in which he laid the stone, and when, secondly, the history of the building of the church of Durham is thoroughly well known from the tract printed in the *Decem Scriptores*, which tells how much was built by William of St. Carilef, how much by the monks, and how much by Ralph Flambard. Where "X." or his authority Buchanan found the mass of myths which follows it is hardly worth while to search out, but at any rate they do not come from any writer of the eleventh or twelfth century. A piece follows about setting up a cross at Stanmore, and how Edgar was received into William's favour, and "never departed from the Court." Therefore we suppose the Peterborough Chronicler and Florence were both wrong in saying that he went away into Normandy and Apulia in 1086.

Meanwhile one or two other people had had their say against "X;" the point with most of them being not so much that they are actually wrong in what they say, as the amusing way in which they put things, the way in which they lag behind the time, and go to worse authorities when better are to be had. For instance, on January 7th, one who signs himself "S. D. Scott" writes to correct "X.," and says that, "had he referred to the old chronicles, or to Thierry's *History of the Norman Conquest*, he would have altered his opinion." Thierry therefore marks the extent of Mr. Scott's modern reading, and the "old chronicles" turn out to be Matthew Paris—that is, doubtless the St. Albans compilation known by his name, Alfred of Beverley, and Peter Langtoft. He does however seem to have got a glimpse of one page of the Yorkshire Survey, and by these means he has been enabled to get to the truth, unknown by "X.," that William not only conquered Northumberland, but thoroughly harried it. On Cumberland and Westmoreland this writer does not touch. But in the same paper there is a letter from Kendal signed "C. Webster" which points out that parts of Cumberland and Westmoreland are surveyed in Domesday, though of course not under those names. But he too adds the following bit of mythical history, and shows what very odd notions some people have about these matters:—

> It is believed the survey was made about A.D. 1080. These counties were not then (I write subject to correction) under Scotch rule. Certainly, though in 1053 Edward gave them to Siward, Earl of Northumberland, the Scotch were found again in possession in 1070, four years after the battle of Hastings, when, after a decisive struggle, they were expelled; and soon after the Conqueror William made good his position by granting the whole of Westmoreland and part of Cumberland to his followers, Ivo de Talebois and Randulph de Meschines.

The next day, January 8th, comes Mr. James O'Dowd, who dates from South Kensington, but who seems to have some official appointment in Northumberland. What he writes is quite to the purpose as far as it goes, only it still reveals the odd frame of mind of a man who thinks that so obvious a fact as William's conquest of Northumberland can need any kind of proof. He quotes a charter of William to the church of Durham, which he seems to

have seen in manuscript, and which we should like to see also, as it does not seem to be the same as any of the two or three Durham charters of William printed in the *Monasticon*. But Mr. O'Dowd unluckily ended with a bit which was seemingly meant for a joke:—

> If William did not conquer Northumberland, he certainly disposed of a portion of it very much after Conqueror's fashion.

And on the 10th he appears again:—

> On further reference to the abstracts of title to unclaimed wreck of the sea furnished to me by lords of manors in 1858, I find that the entire county of Cumberland, including the barony of Burgh, was granted by William the Conqueror to Ranulph de Meschines, by whom it was shortly afterwards given to Robert de Trivers. This fact is stated in the abstract furnished to me by Mr. Nanson, solicitor of the Earl of Lonsdale.

This draws forth a letter, which we suppose is meant to be witty signed "Coll Maclellan," and dated from Cannon Street London:—

> Mr. O'Dowd's discovery of a grant of Cumberland to Ranulph de Meschines by William the Norman proves nothing. Nearly 500 years later Henry VIII. made a grant of lands in the South of Scotland to Sirs Ralf Evers and Bryan Layton.
>
> If I recollect aright the battle of Ancrum Moor settled that affair. Perhaps if Mr. O'Dowd were to make further inquiry he might find a similar result in the case he refers to.

But about this abstract of title we should like to know something more. Nothing is more certain, as Lappenberg has shown, than that the whole story about Ranulf of Meschines is a mere jumble of events of the reign of William Rufus and Henry the First, transferred to wrong times and persons. Mr. O'Dowd ought to be provided with some very strong evidence indeed to show that William the Conqueror had anything to do with Cumberland—that is, with any part of modern Cumberland besides what was then part of Yorkshire.

Then came a lull for a few days, but on January 15th silence again was broken by Mr. Richard S. Ferguson—a different person of course from Mr. Robert Ferguson, but who clearly has some local knowledge, and who refers to Mr. Hinde's paper on the Early History of Cumberland in the sixteenth volume of the *Archæological Journal*, 1859. If "X." and his brethren had read this paper, and also the papers of Mr. Hinde and Mr. Longstaffe on the history of Newcastle and Durham in the Newcastle volume of the Archæological Institute, they might perhaps have been somewhat less rash in their guesses. On the strength of this paper Mr. Ferguson is able to point out the impossible story about Ranulf de Meschines, and he has some idea about part of Cumberland being included in Domesday and part not. He also notices the old boundary of the dioceses, but seemingly without feeling that this is the very root of the matter. He has also much to say about an Earldom of Carlcolium, of which Mr. Hinde has something to say in later times, but which Mr. Ferguson seems to carry back to the days before Eadmund the Magnificent. Altogether Mr. Ferguson, by referring to the works of so thorough an inquirer as Mr. Hinde, has opened a new way of looking at the matter as compared with those who went before him; but he seems to have read nothing besides Mr. Hinde's paper, and to have somewhat muddled what he read there.

At length at the last moment a scholar is moved to speak. On January 16 Mr. Luard, without touching the main subject, writes to show that the story about Ranulf de Meschines has not even the authority of Matthew of Westminster, if, as he cautiously guards himself, there ever was any Matthew of Westminster. The whole tale comes from a note which some anonymous writer has written in the margin of one of the manuscripts of Matthew Paris. That matter, therefore, is settled. If Mr. Luard, or any other scholar of the same rank as Mr. Luard, had taken the matter in hand from the first, a good deal of nonsense might perhaps have been spared, but with the nonsense we should have lost an instructive lesson in one side of human nature.

We must not forget to add that in the middle of all this, on January 8th, the writer of the article on the Public Records himself steps in with a long extract from Ellis's Introduction to Domesday, containing extracts from Orderic and William of Malmesbury, from Kelham and Brady—Kelham, let us add, was, according to his light and opportunities, a far better commentator than Ellis—still these extracts are all very well, and, much as we want a real critical edition of Domesday, Ellis has his use till that happy time comes. But it is certainly funny to read the grand way in which the writer of the article speaks of Sir Henry Ellis, a way so grand as to suggest the idea that he had never looked at the Introduction to Domesday, except for the purposes of this particular article. We give the beginning and ending of his letter:—

> As certain of your correspondents are trying to explain why the northern counties should have been excluded from the survey of *Doomsday*, it may not be out of place to quote from the pages of the chief authority on the subject. Sir Henry Ellis, in his general introduction to *Doomsday Book*, printed under the direction of the late Record Commissioners, essayed his best to arrive at some solution of the matter, and though he modestly stated that he had but opened the way to a better knowledge of the contents of *Doomsday*, few as yet have been able to add to his information.
>
> * * * * * *
>
> I beg to refer the curious on this subject to the exhaustive volumes from which I have quoted, and to which I am indebted for my information, of Sir Henry Ellis.

We beg to refer the curious on the subject to Domesday itself and to the contemporary writers.

CREDIT.

THE correspondence in the newspapers as to the comparative merits of shops and Co-operative Stores is briskly kept up, and it is evident that the natural and necessary consequences of doing business on credit are beginning to be generally understood. The longer the question is discussed, the more clearly will it appear that credit is really at the bottom of it. At this season of the year, when bills are flowing in, the disadvantages of the credit system are probably impressed with considerable force on many minds. In commerce nothing is to be had for nothing. Everything must be paid for, and credit has its price as well as everything else. A moment's reflection will show that a shopkeeper cannot afford to lend money to his customers—and credit is, in fact, only another name for a loan—without being remunerated for it in one way or other. If you buy a particular kind of wine from your wine merchant this year, and next year you want some more of the same vintage, you must expect to pay more for it. The wine-merchant will keep the wine for you, if you like, but he must have interest on his capital; and ordinary shopkeepers must get their interest too. It may not be specified in the bill, but it is charged all the same. If the shopkeepers made only the people who get the benefit of this accommodation pay for it, it would be reasonable enough. It is absurd to suppose that they can sell goods on credit at cash prices; but it is rather hard that those who pay cash should be charged at the same rate as the credit customers. There is no secret as to the way in which the ordinary retail shopkeeper does business. He has only one price for his commodities, and the price is fixed so as to allow what he considers an ample margin for interest on capital and bad debts. It is not surprising that those who pay for what they buy should at last begin to kick against having to pay not only for themselves, but for others who do not pay at all. Some customers pay over the counter, others have weekly bills, others pay at uncertain intervals, and some occasionally disappear without paying at all. There is only one system of doing business under which bad debts can absolutely be avoided, and that is the system of cash payments on delivery; and this ought to be the normal basis of retail trade. Those who want credit should be made to pay for it in exact accordance with the amount of the loan and the length of time during which it runs. To spread the cost of credit over the whole business, and make people bear a share of it even when they pay ready money, is obviously as unjust as it would be, for example, to make people who come only for tea pay something additional as a contribution to the expense of providing certain other people with coffee. Credit is just as much a commodity as tea or sugar, and should be sold by itself and at its own price.

All this is sadly elementary; yet it is surprising how little it is practically appreciated. The majority of customers undoubtedly pay for what they buy, and most of them pay either at once or within a few days. It is quite clear that if the majority thoroughly realized in their own minds what the credit system implies, they would resolutely refuse to go on paying any longer for the people who never pay at all or pay only at long and capricious intervals. As the strike of ready money customers has not yet become general, we can only suppose that they have not had time to master this exceedingly simple and elementary problem. The shopkeepers would of course be bound to follow the dictates of the majority of their customers, and the improvident and prodigal minority would be left out in the cold. It may be hoped that the shopkeepers themselves, now that their eyes are being opened by this useful discussion, will understand their own interests sufficiently to do justice to their best customers instead of continuing to sacrifice them to their worst as they do now. It suggests an odd phase of human nature that tradesmen should be so anxious to lay traps for themselves and to increase the hazards and losses of their business. They seem to have a notion that the credit customers, though they are the worst in one way, are the best in another. They are a risky speculation, but then, if the speculation pays at all, it pays well. Credit customers do not keep a sharp eye on price-lists, or check accounts, and the shopkeeper takes care to swell the total so as to net a handsome profit if the bill is ever paid. It is impossible to check items at the end of a year or two years, and the longer the bill runs the faster it grows. If anybody who pays cash or has weekly bills will allow his bills to stand over for a month or so, he will probably be startled at the number of things which have been set down to him which he never recollects having seen, and also at the strange advance in the prices of familiar commodities. The gains from this class of customers may be perilous, but when they come they have a large and attractive look. In the long run no doubt the tradesman does not make so much in this way as he might make by cultivating a steady cash business with moderate profits and quick returns; but there is something exciting in the reckless and dishonest game which is not without its temptations. A pretence of allowing discount for cash is sometimes kept up. Five per cent. is allowed, but this is a trivial abatement from the twenty-five, or in many cases fifty, per cent. which has been stuck on in order to cover the risks of selling goods on credit. At a West End tailor's or jeweller's fifty per cent. would be a low estimate of the addition made to prices on this account. In these and kindred lines of business credit is allowed to an absurd and monstrous extent; almost anybody of good appearance, who has a respectable address to give, can order goods to a large amount, especially if there have been some previous small dealings to start the acquaintance. The shopkeepers go in deliberately

for this speculative and perilous kind of business. They know perfectly well beforehand that on the doctrine of probabilities they must, when running such constant risks, suffer in a certain number of cases for their temerity. If it were only a question between the shopkeeper and his debtors, they might be left to fight it out between them. The tradesman has a right to run these risks if he chooses, but it is rather hard that he should make his cash customers smart for it. There is another reason perhaps why tradesmen like to give credit; they seem to have a notion that they thus acquire a hold upon customers, who will feel bound, when they owe money, to keep on giving orders, and will not like to go to other shops. A wise tradesman would understand that the most effectual means both of getting and keeping customers is to supply uniformly good articles at moderate prices.

There are many reasons why it would be well if a strong effort were made to discourage the system of doing business on credit which is now carried to such a foolish and ruinous extent in London. First, there is the waste of it. It adds enormously to the prices of all kinds of goods. The retail vendor has to lock up a larger amount of capital in his business than would otherwise be necessary. The chances are that it is not his own capital; it is probably partly borrowed, and partly made up of credit from the wholesale houses with which he deals. He is cramped and fettered by debt, and becomes helpless in the hands of the wholesale people, who could sell him up any day, and who know that he dare not complain whatever may be the quality of the goods they choose to send him, or whatever may be the prices at which they invoice them. The result is that he carries on his business in an expensive way, and that he is driven to all sorts of shifts to squeeze as much as possible out of customers, forcing up prices, and cutting down measures, and making the most of quantities by cheap adulterations. It is impossible to imagine anything more demoralizing for all concerned than the relations which naturally spring from this system. The shopkeeper has to lead a struggling hand-to-mouth existence, never free, never ahead of his business. The wholesale firms lose the benefit of the stimulus which would be applied to them if they had to deal with free, independent men, who could make their own terms, and insist upon having only goods of the best quality. The system is manifestly unjust to cash customers, who are taxed in order to make up the deficiencies of their extravagant and improvident neighbours. But perhaps the people who get credit, and who may seem at first sight to be the very people to benefit by the system, suffer most. If they are sharpers or adventurers they may run away in the night when they have got all they can out of a neighbourhood; but, as a rule, of course the customers who take goods on credit are foolish, reckless people, who go on accumulating debts which hang like a millstone round their necks for the rest of their lives. They are always paying off some of the debt, but it grows faster than they can keep pace with it. They pay twice or thrice over for everything they have. Credit is tempting at first, but afterwards it becomes a kind of penal servitude. And so they go on struggling and stumbling, always getting deeper in the bog, till at last perhaps things come to a crisis in a general break-up. There is nothing more pathetic in its way than a stylish family in a big house being dunned by the milkman. Even a milk bill will sometimes run up to 40*l.* or 50*l.*, or the greengrocer's to twice as much. From every point of view the credit system is pernicious. It is wasteful and demoralizing. It adds to the expenses of trade, and raises prices. Credit in large mercantile operations is a very different thing from credit in the petty transactions of domestic life. In the former it is, if kept within due bounds, a means of developing trade. But in private life there should be as little book-keeping as possible, and the current expenditure should be scrupulously kept within the known limits of income. If the retail dealers made it a rule to insist upon cash payments from their customers, they could in their turn make cash payments to the wholesale houses, and would acquire greater independence and freedom of action. They would be constantly turning over their capital, and would save largely in interest, bad debts, and law expenses. The reduction of prices which they would thus be enabled to effect would stimulate consumption. We have no doubt that many tradesmen are fully aware of the mischievous effects of the existing system, and would gladly reform it if they could; but they do not know how to begin. Society has its habits, and they are hard to change; and unfortunately the habit of cash payments is not as yet a very fashionable one. There is no reason why the shopkeepers should not strengthen themselves by confederation. The early-closing movement was accomplished by common agreement, and a ready-money movement would no doubt meet with similar support if it were once started. Preaching against credit is pretty much like preaching against other forms of waste or improvidence. It is an old sermon. There is nothing new to be said on the subject; but the discussion which is now going on will be useful in forcing people to reflect on the evils of the present way of doing business.

ECCLESIASTICAL LEGISLATION IN GERMANY.

IF the Bills which have just been introduced into the Prussian Chambers by the Minister of Ecclesiastical Affairs should become law, it is difficult to exaggerate the importance of the changes that would inevitably ensue. It has long been generally felt in Germany, and was expressly asserted the other day in a remarkable article in the leading German newspaper, that the religious question outweighs in importance at this moment all others in the internal economy of the Fatherland. "The influence which the Roman Curia seeks to exert over the innermost life of the State is a matter of paramount importance," observes the *Allgemeine Zeitung*; "it wounds us to the core, and seriously imperils the peace and orderly development of civil life. It makes the relations of Church and State the question of the day." Two recent Acts of the German Legislature have been specially directed against this impending danger—namely, the expulsion of the Jesuits and the new regulations about the inspection of schools. To most Englishmen the first of these laws cannot fail to appear difficult of explanation or defence, nor do we intend to enter on any discussion of its merits here. If Germans assure us that circumstances render necessary in their case what to our ideas appears at best an anachronism, we do not care to dispute what our own experience happily does not help us to comprehend. The law about school inspection is more intelligible and more permanently important, when we remember the vital influence of the system of primary education on the formation of popular belief. It was on the control of the whole educational machinery, as the *Allgemeine Zeitung* truly enough points out, from the elementary schools to the Universities, that the energies of "the neo-Roman party" were principally concentrated. And it was here, we may add, that they had long been sedulously, though secretly, laying the train which finally exploded in the definitions of the Vatican Council. Of the remarkable series of pamphlets issued last year by the Abbé Michaud, none is more instructive than that on the Falsification of French Catechisms, and what he has illustrated in the case of France is true also of Germany. There too, for years before the Vatican Council, there was a gradual process of manipulation of primary religious instruction carried on, chiefly by means of the Jesuit Deharbe's catechism, working up to the full teaching of Papal infallibility. "They raised a cry of triumph when the decree was passed which they had long been looking forward to as a necessity, and straining every nerve to achieve." *Spes messis in semine* is a principle of which Ultramontanism has never been slow to avail itself: but skilfully as their plans have been laid, the harvest is by no means so abundant as the faction who are "struggling to supplant the historical basis of Christianity" have ventured to assume.

While, however, the general system of primary education has a critical effect on the moulding of national belief, even more depends on the training of the clergy, who are themselves the religious teachers of the great mass of the nation who have any religion at all. The old question, *Quis custodiet custodes*, is not of less importance in the modern than in the ancient State. And, therefore, as we began by observing, the three Bills lately introduced by Dr. Falk, if they make less show and provoke less violent antagonism than those already passed, must cut deeper in their ultimate effects. The first of these regulates the course of studies for aspirants to the priesthood; the second protects the clergy from the arbitrary despotism of the bishops; and the third, which will be sufficiently puzzling to an English reader till it is explained, provides that converts from Catholicism or Protestantism may change their communion on making a declaration to that effect before the local magistrate. The existing law requires a previous consultation with the priest or *pfarrer* before secession can legally take place, and its repeal is chiefly interesting from the strangeness of the fact that it has to be repealed at the present day. But the two former Bills, and the first especially, have a much higher practical significance. It appears that since the Charter of 1850, which liberated all religious communities from State supervision, the bishops have had the entire management of clerical education in their own hands, and it is during the last quarter of a century that Ultramontane teaching has made such enormous strides in Germany. With many of the bishops themselves, trained under Jesuit auspices at Rome, acting under Jesuit guidance in the administration of their dioceses, and holding the moral and intellectual formation of their clergy under their exclusive control, this consequence was sure to follow. From earliest boyhood the young aspirant to the ministry is sharply marked off from his secular comrades, trained in separate seminaries under a rigorous discipline of surveillance and police, till from the *petit séminaire*, as it would be called in France, he passes to the larger seminary, which perhaps may be connected with a University, but even so is kept strictly under ecclesiastical supervision. And if we ask what kind of intellectual training these exclusively clerical seminaries supply, it is easy at least to specify what, according to the Council of Trent, on whose decrees they are based both historically and in principle, they are intended to supply. The youths trained there are to be taught "grammaticæ, cantûs, computi ecclesiastici, aliarumque bonarum artium disciplinam, sacram Scripturam, libros ecclesiasticos, homilias Sanctorum, et sacramentorum tradendorum et rituum et cæremoniarum formas." In other words, the prescribed curriculum is rigidly narrow and professional, and omits the main elements of what is called a liberal education. And if it is thus defective on the intellectual side, in its moral aspect it is open to still graver criticism. The jealous separation of boys destined for the priesthood from their fellows throughout the whole educational career, even supposing that a vocation involving lifelong celibacy could be profitably tested at ten years old, is, to say the least, a serious mistake. It is the inevitable tendency, if not the direct object, of such a system to freeze and isolate the sympathies and stunt the healthy develop-

ment of character; in a word, to fabricate machines rather than to train men. Its practical effects under the most favourable circumstances are seen in France, where the want of independence of character and the low intellectual standard of the priesthood as a class, have combined to alienate from their control the male intellect of the country. And it is remarkable that those of the Catholic clergy who in recent times have wielded the greatest influence over the life and thought of their contemporaries have been men not originally trained for the office, but who have passed in middle life, like Newman, or Ravignan, or Lacordaire, from another communion or another calling to the service of the altar. It is this system which the proposed law would bring to an end in Germany. The seminaries for boys are to be abolished when vacated by their present occupants, and the future priests are to receive their education in the public schools and Universities, their strictly professional course being based on a previous proficiency in general subjects instead of being substituted for it. This, it may be remembered, was one of the points chiefly insisted upon in the programme of the Old Catholic Congress at Munich in 1871. And it must be obvious on the surface to the advocates and the enemies alike of the present system how vast a change its abolition would eventually involve.

Nor is this the only change that is contemplated. If the existing discipline serves to mould the clergy into pliant tools, the bishops have every opportunity of keeping them such for life. It is probable that with a clergy differently trained, whose support they could rely upon, the German bishops who have one by one been falling off from the ranks of the Opposition might have found courage to spare themselves the public humiliation of enforcing under anathema the very doctrine they had confuted and denounced. Be that as it may, the comparative paucity of avowed dissentients among the clergy is notoriously measured by their arbitrary power of enforcing submission, which henceforth is to be largely curtailed. Their appointments to livings will be made subject to the approval of the Government, and their favourite practice of appointing provisionally incumbents whom they could thus keep in absolute dependence on their own caprice, will be restricted to the period of a year, nor will they be allowed to retain in their cures priests who have been deprived for civil offences. And, on the other hand, those who are deprived by the bishops for obeying the law of the State will have a right to appeal to the civil courts, very much like apparently what is called the *appel comme d'abus* in France. It is not so easy to appreciate the force of another regulation which vests the power left in the hands of the bishops in themselves alone, "to the exclusion of the Pope and all non-German authorities"; for, unless all intercourse with Rome is forbidden, and the prohibition rigidly enforced—which would be equivalent to creating a formal schism—they are pretty sure for the present to exercise their powers under Papal direction, whether formally expressed or not. It will take some years, of course, for a new generation of clergy to grow up under these changed conditions of discipline and general culture, supposing Dr. Falk's measures to become law; and no important result therefore, can be looked for in the immediate future. But meanwhile the position of the Old Catholics will be materially strengthened in the Empire, and their ranks are likely to be augmented by fresh recruits from the parochial clergy, when fidelity to conviction no longer means starvation and disgrace. But it remains to be seen whether the hierarchy will submit to the new conditions to be imposed on it without a desperate struggle. There is no point that has been more strenuously insisted upon during the last three centuries, wherever Rome and her faithful prætorians, the Jesuits, could have their way, than the separate system of seminary training, which may indeed for the purposes of the Curia be almost regarded as the key of the whole position. It provides in every country a well drilled army, through which the *mot d'ordre* from headquarters can be swiftly and surely circulated at any moment, and whose first instinct will be not to reason, but to obey. Such an organization is invaluable from the Roman point of view; but in proportion as it promotes the ends of a centralized Papal bureaucracy, it is not unnaturally regarded with disfavour by society generally, and with jealous suspicion by the State.

AMERICAN JOURNALISM.

AMERICAN journalism is coming to the front at the Vienna Exhibition. An imitator of Mr. Cole, C.B. has proposed to form a catalogue of American periodical literature, with specimens, and it is expected that by this means an idea of the great mental activity of America will be impressed upon European visitors to the Exhibition. Some visitors might perhaps think that it is possible for a country to have too many newspapers or to spend too much time in reading them, but that view is not likely to be accepted by the projector of this catalogue. "Ours," he says, "is pre-eminently a country of newspapers." He challenges the outside world to show anything approaching the enterprise, vigour, and extent of American journalism. "An opportunity now presents itself for making good our claim to this distinction." It is proposed to exhibit a single specimen number of every newspaper, magazine, or review issued in the United States, and the collection would also embrace all periodical publications circulated gratuitously by tradesmen. To collect and classify such an immense mass of material will be a laborious task, to which, however, the patriotic energy of the projector promises to be equal. Indeed he undertakes even more than this. The collection is to include also almanacs and year-books, periodical reports on matters of general interest, transactions of learned societies, "certain periodical patent medicine pamphlets, and similar publications." The collection will be arranged geographically, "so that every section of the country may receive due credit for its contributions to periodical literature—the education of the masses."

It is remarkable that the author of this proposal does not see that his collection would not excite the slightest interest in the majority of visitors to the Exhibition except perhaps as a convenient magazine of waste paper. As regards Englishmen, many of us when we go upon a holiday abhor the sight of any print beyond a guide-book; and at any rate we have enough of reports and circulars and pamphlets at home, and do not care to be overwhelmed with the produce of America. If it were a thing to be proud of, we could ourselves make a considerable contribution to such a collection as is here proposed. An enthusiastic admirer of penny-postage once proposed the number of letters received within a given area as a test of the happiness of its inhabitants. This projector would perhaps consider the quantity of circulars issued in a district as a measure of its education or intelligence. He proposes to give the outer world an opportunity of seeing "with what comparative exhaustiveness even the special subdivisions of trades are represented in the periodical press of the United States." If the outer world felt any curiosity on the subject, we could easily convince it that trades are represented in the periodical press of England to an extent that is not only comparatively, but positively, exhausting to those who have the misfortune to be familiar with it. There was, and probably is, a periodical called the *Grocer*. Such a periodical would doubtless be useful and interesting to many London tradesmen, but we should not have dreamed of exhibiting it to the people of all nations who will be collected at Vienna, and of whom the great majority will not understand one word of English. We should hardly think that even the most industrious German would be tempted to acquire our language for the sake of reading a leading article upon sugar. Nor can we conceive that either a single number or even an entire series of the *Grocer* would form a very stupendous spectacle for the foreigner who could not read it. However, let us say no more at present about our own periodicals, whether they represent trade or anything else. We will leave to America undisputed possession of the wonderful supposition that all mankind must be interested in publications which only a few could, and still fewer would, read. It is suggested, indeed, that the proposed catalogue of American publications may sometimes be useful for purposes of business. "Suppose a merchant in a distant part of the world desirous of information touching Petroleum in America." We should expect that he would write to a correspondent. But this projector expects that he would look at the index of the catalogue, "where he would be immediately referred to the *Titusville Herald* and such other American journals as represent this interest." Considering that the merchant in a distant part of the world, even if he happened to have the catalogue at hand, would certainly be obliged to await a return of post from America before he could be supplied with the *Titusville Herald*, and that perhaps he could not read it when he had got it, we remain of our original opinion that he would be likely to seek information about petroleum by ordinary correspondence. But still it is permissible to American vanity to speculate on the effect to be produced on the mind of a Transylvanian or a Belgian by the sight of a copy of the *Titusville Herald* in the Exhibition at Vienna.

We have obtained the above particulars from a circular issued to the publishers of American newspapers and periodicals, inviting them to make returns descriptive of the "broader characteristics, as well as the individual features," of their publications. It might be interesting to outsiders to see a collection of similar returns made on account of the English press; but it is hardly probable that a Frenchman or German would take the trouble to understand them. There is probably no foreigner who can distinguish the religious sects and parties into which we are divided; and still less would it be possible to derive any clear idea from a classification of newspapers by religion, even if the newspapers were able to classify themselves, which would, as we think, be difficult. We frankly admit the "exhaustiveness" of the proposed classification, and indeed we should expect that it would exhaust both the energy of the publishers and the patience of the public. "Thus," says the circular, "under the heading 'Commerce,' a leading periodical would be further qualified as 'free trade' or 'protectionist'; under 'Religion' as 'episcopal,' 'presbyterian,' 'Lutheran,' 'Jewish,' and, with the various shades represented, 'orthodox,' 'reformed,' &c." It is added that this exact classification must be of essential service both at home and abroad to subscribers as well as to advertisers. All this is exactly in the style in which Mr. Cole, C.B. recommended his Universal Catalogue of Art Books, in which, however, the public failed to see any utility at all except as a convenient method of providing public employment and pay for professors of the art of using scissors and paste. The proposal to specify the political character of newspapers seems to us an instance of what is called "putting too fine a point upon it." Thus it might be difficult for anybody in or out of Printing-house Square to define the politics of the *Times*. As far as we can understand the principle of classification, it would not be necessary for any of the London daily newspapers to explain whether they have any and what religion. But

when we come to weekly newspapers we are not quite sure how to deal with them. There are two or three such newspapers of which the name will occur to every reader. They supply political, social, and even fashionable intelligence, both home and foreign, and it might be inferred from the prominence which they give to particular heads of news that the larger part of their readers are clerical. These newspapers, therefore, feel called upon to have a religion, and we will assume that they are capable of describing it. But if every periodical that circulates primarily among the clergy is under the same obligation, it would apply, among others, to the *Clerical Directory*. On looking at the published form of return we find more questions asked than are likely to be answered. A newspaper is not, we think, bound to state its circulation any more than a lady is to disclose her age. It would be entirely contrary to English practice to publish the editor's name. As regards the "subject-matter of publication" the answer would perhaps be easy to the publisher, although apparently difficult to anybody else. Thus we have before us a paper called the *Metropolitan*, of which we assume the object is to furnish information specially interesting to the inhabitants of London. Such a paper clearly need not have a religion, and we should think that, in any but a local sense, it need not have any politics. It publishes at full length the proceedings of the Metropolitan Board of Works, which may be considered from its point of view as superior in importance to those of the Imperial Parliament. Besides this paper, which aims at representing the whole metropolis, each considerable section has one or more newspapers which concern themselves with local interests in a narrower sense. Then there are journals which devote themselves to writing down the liquor trade, or the use of tobacco, or the Game-laws. We have seen lately a publication calling itself *Sale and Barter*, which purports to be "a universal register of property for disposal," but which nevertheless makes excursions into the domains of literature, politics, and possibly religion. All these publications are useful in various ways, and some of them perhaps are ornamental. They show intellectual activity of a certain kind; but if we have in England a journal devoted to the tobacco trade, we should rather accept the fact in silence than boast of it to the universe. Unfortunately the habit of tall talk is deeply rooted in America, and native readers of this circular are likely to be insensible to its grotesque character. Let us hope that this country is not quite so far gone in the same bad way. The number and variety of our newspapers prove our wealth and material resources, but are less conclusive upon the question whether our people are educated as they ought to be.

SHRINES AND THEIR VISITORS.

WHEN we read of expeditions of the faithful such as that which has just made its annual start from Cairo for the Kaaba, we are almost inclined to lament the decay of faith in Christendom, and to regret that what used to be the religion of conviction should pass now for superstition. When the Church approved the pilgrimages which sought absolution and the remission of sins through a long series of perils and hardships, it only sanctified and utilized a principle which had been a spring of human action from the most remote ages. Faith hallowed works. As the devout Mussulman to this day can only die in peace and hope when his face is turned to Mecca, so there was unspeakable comfort alike to the oppressors of the middle ages and to their victims when they turned their backs on the world in which they had sinned and suffered. Their betaking themselves to pilgrimage was the visible sign of the repentance that was to soothe remorse, of the final renunciation of the earthly ambitions which had been a snare to them. It was the foretaste of the heavenly joys which were to recompense worldly griefs and miseries. We can in some measure conceive the exaltation or prostration of mind that induced them to set themselves to work out their salvation by a slow, painful, and wearing process. The solitary pilgrim who started from the shores of the West for the Holy Sepulchre and the scenes of the Passion and Crucifixion could feel little confidence that his strength and means would ever carry him to the distant end of his journey. The simplicity of his outfit indicated the hopelessness of making fleshly preparations adequate to an undertaking so formidable. With his gown of serge and his staff, his scrip, his sandals, and his scallop-shell, he made his start, relying on his helplessness and on charity, next to the guardianship of the saints and angels. If the symbols of his calling usually served as a passport through the domains of the truculent petty tyrants who levied contributions on every one else; if his poverty was a safeguard among those roving bands of freebooters who ambushed themselves in the forests, and flayed and plundered travellers on their own account; if he often found harbour for the night and rude hospitality from some monastic establishment bound by its vows to entertain pilgrims, or from poor peasants who looked for repayment from above for the crust and cup of cold water they bestowed in charity—still his sufferings must have been great even while his route yet lay through Christian countries, and many a constitution enfeebled by excess or privation must have succumbed. He was condemned to perpetual silence and denied all human intercourse, save that of looks and signs, as he journeyed onwards among people of strange speech; his fare was coarse and scanty, and his quarters were rough at the best; he was exposed to all the vicissitudes of seasons and weather, and he had to perform a pedestrian feat over execrable roads which would have sorely tested the endurance of the toughest and most highly trained professional of modern times. But hardships changed to deadly and constant peril when he had to pass on to the territory that was under the sway of the Soldan. In spite of a certain sympathy which even Moslem fanatics felt for travellers bound on a holy pilgrimage, in spite of a precarious protection from those military monks who upheld Christianity and championed Christians in Palestine, it remains a mystery how even the few who did live on were ever spared to kneel at the Sepulchre. The reward of those few no doubt was great, and even those who died in striving after its attainment died in hope, if not in assurance. But it is no wonder that, as scepticism in later centuries spread with enlightenment, faith, growing feebler, should shrink from an ordeal so terrible and from sacrifices so tremendous. Men began to seek absolution by instalments. They squared their spiritual accounts by shorter and less formidable pilgrimages; and more accessible shrines, like that of the sainted Becket, grew fast in favour and renown. The dignified priests, who assumed greater authority as they were enriched by the offerings of the throngs of worshippers, made it matter of conscience or interest to expatiate on the miraculous potency of their patron saint in all matters spiritual and carnal. Then, in place of those long wanderings when men as it were partook of the viaticum before a journey that must probably be their last, we have the cheery Canterbury pilgrims cantering across the bright pages of Chaucer, and lightening the way with their merry tales. Their sins and peccadilloes sat as easily upon them as those of the Belgravian penitents who crowd in the very latest fashions to hang upon the eloquent lips of some Charles Honeyman.

That fresh old faith still survives among the more dreamy Orientals in all its fulness, and one is half tempted to envy it to them. How long it will linger on in anything like its pristine freshness and vigour even in the East it is difficult to say; but we suspect that material influences will sap it more swiftly and surely than moral ones. It is not certain that even the spread of education will fatally impair it. The religion of shrines and of pilgrimages is of the very essence of Mahommedanism, and a Mahommedan is seldom the less devout because he has learned to go straight to his sacred writings for instruction as to the tenets of his faith. But in proportion as science and enterprise facilitate these holy journeys, as philanthropists encourage road-making and introduce sanitary improvements at the most renowned religious centres, as time is economized and mortality diminished, so the pilgrimages will assume an altered aspect. The number of votaries may increase for a time, but pilgrimage will be undertaken in a lighter spirit. We may call the motive that has hitherto sent men on such journeys superstition if we will; still it is impossible that people should not more or less feel it to be a serious matter to be travelling in the shadow of probable death. One remembers the graphic chapter in which Dr. Hunter describes those stupendous human sacrifices which are periodically offered at the shrine of Jagganáth. The vexed question as to whether the devotees cast themselves deliberately under the car of the idol is of little consequence. They perish by thousands, by a death almost as certain, in the city of Puri, and on the roads that lead to it. They toil thither over burning plains and through pestilential swamps; they sojourn at the place itself in a crowded hotbed of disease, whose streets are so many streaming cesspools fermenting under a blazing sun; they feed upon putrid rice and sweetmeats until these scanty supplies of slow poison run out, and then they starve. There must be something that is solemn and sincere about a journey that is likely to lead you literally through the Swárga-Dwara—the gate of heaven—although the motives that inspire it may be mingled, and although there may be much that is ludicrous and trivial in its episodes. So in that annual expedition of pious Mahommedans who make Cairo their starting point for Mecca. It may not be so terrible an affair as its Hindu counterpart, and the goal at Mecca is looked forward to as a place of repose and refreshment, but nevertheless many drop by the way. For weeks, if not months, before the caravan starts, the men who mean to join it come flocking in to Cairo. Many of them ply their industries, or sell the wares they have brought from their own far countries, by way of providing for their travelling expenses. But, grave as is the ordinary population to be seen in the Cairo bazaars, you imagine that the faces of these stranger pilgrims look more serious than those of their neighbours. Nor is it surprising. It is not playing at religion to travel in a slow caravan through the sands, sunlight, and simoom of the burning Desert, keeping body and soul together with a stock of provisions which there is seldom the means of replenishing; with brackish water simmering in the bottom of their flaccid water-skins, speculating on the possible contents of the next distant well—to say nothing of the chances of attack from wandering Ishmaelitish robbers who may not even respect the sacred Kisweh or the Mahmal. Yet the sufferings of Hindu and Moslem pilgrims have already been shortened; their expenses and the risks they run have been reduced. Puri and Mecca owe not a few of their visitors nowadays to Western energy and joint-stock enterprise. Many of the worshippers of Jagganáth are carried cheaply third-class by Indian Railway Companies to the edge of the swamps and wastes through which they have to foot it. Moors and Algerians, Syrians and Persians, take their steerage passage to Alexandria on board a Mediterranean screw-steamer, in place of crowding together on some primitive craft which beats up slowly against the adverse elements,

and whose decks are swept in turn by the chopping seas and the unwieldly boom of the tremendous lateen sail. Sooner or later the Railway Companies of Northern India may construct an Orissa Extension; a native Board of Works may undertake the purification of Puri under English superintendence, and a city of model lodging-houses may rise round the gates of Jagganáth's temple. Sooner or later that system of Egyptian railways which is stretching itself towards the oases in the Libyan Desert and the sources of the Nile will doubtless embrace the caravan road to Arabia; while, should the improving traffic be sufficiently encouraging, a regular line of steamers may be established to ply in correspondence with the port of the holy Mecca. Only, if the manner of pilgrimage comes to be modified by modern facilities, the spirit will probably be transformed as well.

If we were to speculate on the day when some Hindu or Egyptian Cook will organize his pilgrim parties and issue his programmes and coupons—the system, indeed, is to a certain extent adopted in India already—we should scarcely exaggerate the probabilities of the case. We have actually seen what is the nineteenth-century counterpart of the old Christian pilgrimages, primitive and mediæval. The catastrophe which has befallen France, with the consequent depression, searchings of hearts, and self-humiliation, created a state of feeling which was morbid, although unquestionably sincere. Minds were stirred, and the contagion spread in devout circles as it did in other times. The sneers of polite sceptics, the threats and abuse of the democratic crowds, far from deterring, acted as incentives. They represented that more material persecution of darker times under which faith proverbially flourished. Yet what did the movement come to after all? We do not venture to scrutinize the secrets of individual hearts, or to appraise the aggregate amount of genuine religious feeling; but we may be sure that only intense earnestness and exceptionally profound enthusiasm could have altogether resisted the disenchantment of uncongenial and commonplace surroundings. Crowds gathered at the Madeleine to receive, among other excellent advice, words of practical counsel as to the travelling commissariat. There were special trains and first-class carriages for those who could afford them, perhaps somewhat crowded. The worst hardship was a little cramping of the limbs, some slight restrictions as to personal baggage, a scramble for beds in the inns and lodging-houses of Lourdes, and sundry shortcomings in eggs and fresh butter. Of course some few impressionable, exalted, or abstracted natures may have soared superior to all these trivial commonplaces which dragged them back again to everyday life; they may have bent in concentrated fervour at the Virgin's shrine, and come home again comforted with the idea that they had done something towards saving not only their own souls, but their sinful and suffering country. But certainly it must have been far otherwise with the majority; the result of their pious experiment must have satisfied many of the devotees that the days of pilgrimages had gone by in the West. If the religion of the shrine still lingers in the East, it is because the romance and the reality of endurance and suffering remain there as well; but faith will inevitably give way to fashion as the roads to the shrine are smoothed and shortened.

THE METROPOLITAN FIRE BRIGADE.

THE duties of the Metropolitan Fire Brigade are performed by a total force of under four hundred men. The Chief Officer testifies in his Report for last year to the valuable assistance which he has received from the police as well as from the public. He draws attention to the danger to which valuable property on both sides of the Thames is exposed during a considerable portion of every day, when it is cut off from a quick supply of water. This deficiency occurs regularly twice every day, and lasts each time about eight hours—namely, from two hours after high water on the ebb tide to two hours before high water on the flood. Thus during about sixteen out of every twenty-four hours waterside premises are liable to be placed in the utmost peril by any fire occurring in them or in their immediate neighbourhood. Experience has shown that at certain parts of the banks a single line of hose cannot be got on shore in less than thirty minutes by forty skilled men working in full daylight. It is necessary to make a road over the mud by means of hurdles, matting, or other appliances, and, even after this has been done, the utmost caution is required to prevent the men falling over and being lost. It is impossible to save a man out of the mud unless he is seen at the moment of his fall and the spot is marked before the mud closes over him. Among the dangers to which firemen are exposed must therefore be reckoned this, of being smothered in the mud which intervenes between the water of the river and the fire to which they desire to apply it. The remedy for this deplorable state of things would be to provide a sufficient number of "hards" over which the firemen could pass without the delay which occurs when they have to lay down a road for themselves. It would also be necessary to provide on the land side pipes of adequate size, with a constant supply of water. At present such pipes do not exist, and thus valuable premises, being as it were between land and water, enjoy during many hours of the day the advantages of neither. A floating fire-engine is very powerful where it can float, but its efficiency depends upon the condition of the tide. Owners of river-side property will do well to consider the danger to which they are thus exposed. The skill and courage of the Fire Brigade ought not to be neutralized by circumstances which are capable of removal.

It will probably have occurred to many persons that, considering the dangerous nature of gas, and the small caution with which it is used, the number of accidents arising from it is wonderfully small. We find from the Report before us that the number of serious and slight fires in lodgings in the year 1872 was 161, of which 44 are attributed to candles, and only 4 to gas. Of 289 fires in private houses 71 were caused by candles, and only 17 by gas. Children playing with lucifers caused 9 fires in private houses, and lucifers ignited in other ways also caused 9 fires. Thus lucifers appear to be slightly more dangerous than gas. Defect or foulness of flues caused 53 fires. Smoking tobacco caused 5 fires, and intoxication only 1. It is certainly remarkable that so small a share of mischief should be ascribed to excess in drink. It has been often observed that drunken men take much better care of themselves and their property than might have been expected. They contrive to avoid falling either into ditches or under wheels, and it would almost seem that since the new Licensing Act the greatest danger to which they are liable is a policeman. In lodgings, where perhaps there is more disorder than in private houses, the number of fires attributed to intoxication is only 4. In houses kept by "victuallers," which doubtless means persons who sell drink, not a single fire is ascribed to excessive drinking. There are, however, a considerable number of fires of which the cause is stated to be unknown, and perhaps it may be fair to assume in some of these cases obliviousness produced by drink. But even after making a considerable addition on this account, it is surprising that what the *Alliance News* would call "barrel and bottle work" makes so small a figure in these returns. Smokers at any rate have much more to answer for than tipplers.

A few years ago Captain Shaw supplied to a Committee of the House of Commons some curious calculations as to the amount "spent" in various towns on fires. In Liverpool, he said, they spend 12*l.* on each fire, and in Dublin they spend 20*l.*, while in London the cost amounted to 18*l.* These figures were doubtless obtained by dividing the total cost of a Fire Brigade in a year by the number of fires. It appeared by the same process of calculation that in Boston they spend 157*l.* on a fire, in Baltimore 90*l.*, and in New Orleans 172*l.* In New York formerly the Fire Brigade was altogether a voluntary force, if indeed it deserved to be called a force. "Their behaviour," said Captain Shaw, "was, to say the least, disorderly. There was no management, and there were constant quarrels." Nothing was properly done, and the system became at last quite intolerable, and was abandoned. A paid system was then established, which followed slowly in the footsteps of the London Brigade. The reason why they had not advanced as fast as they intended was that they had been obliged to enrol in the paid brigade so many members of the old brigade. It was suggested that these American brigades did not touch small fires; but Captain Shaw answered that they made a great deal of show and turned out the engines at great expense. The principal number of Captain Shaw's men were at that time sailors taken either from the Royal or mercantile navy. No men, he said, are so available as sailors, especially if they could be obtained young enough. The sailor has learned discipline, and is so strong and handy at climbing and other quick work that he can be made available for the general work in two or three months.

The earliest establishment by law of fire-engines in London was parochial, and dates from the year 1707. A few of the Insurance Companies had previously established engines of their own. The parish engines received rewards for attending at fires, but it was not necessary to have an effective engine in order to claim the reward, and the consequence was that the parish engines soon fell into great neglect. The beadles in charge of the engines were generally very old men, and they sent the engines out in charge of boys, and in some cases of women, and they took the rewards all the same. This being all that the law could do, the Insurance Companies tried to improve upon it by voluntary action. They tried for many years to amalgamate their forces, but there were great difficulties in the way. The chief objection was that any Companies which refused to join would still have their own engines as an advertisement, and would make themselves very much known; whereas those Companies who joined would lose the advantage of the advertisement afforded by their engines running about the streets. After a great deal of negotiation, the London fire-engine establishment was formed in the year 1833, and it lasted for thirty-three years. Immediately after the great fire in Tooley Street in 1862, the Insurance Companies began to reconsider a subject which had been frequently before them—namely, the responsibility of continuing to protect the whole of London at the expense of the insurers of London. It is wonderful that such a system should have endured so long. The Fire Brigade of the Insurance Companies was handed over to the Metropolitan Board of Works on 1st January, 1866. The chief station is at Watling Street, where it used to be. The most distant station in 1865 was three miles from the central station, but now there are stations at distances of six miles or more, and new stations are being continually added. The number of miles run by fire-engines in a year is upwards of seventeen thousand. There are few false alarms, whereas in some American cities there are many. There is still much to be done in the way of building stations, and in finding men to put into them.

London is spread over so much ground that it must be difficult to satisfy expectations which can hardly be called unreasonable.

People naturally think that there ought to be a station near them, and efforts have been made in several districts to supplement the deficiencies of the regular Fire Brigade by a voluntary organization. There is not much danger of such an organization being converted to a political purpose as was done some years ago at New York. But perhaps it might have a tendency to become ornamental rather than useful. Captain Shaw, being questioned on this subject before the Committee of the House of Commons, spoke handsomely of the services of the volunteers, but gently complained of them for copying his men's helmet. It must have been difficult for Captain Shaw to preserve decorous respect for the Committee when a member of it asked him whether he did not think it would be an advantage to have a number of volunteers who would "take up the question" and stimulate his men to come forward in time. It is one thing to take up a question and another to do a fireman's work. The notion of a race between regulars and volunteers for priority of arrival is slightly ludicrous. The Fire Brigade owes much of its efficiency to exact discipline, and a competition between it and another force excelling rather in zeal than order would probably go far to neutralize the utility of both. There must clearly be a commander of the army which engages the fiery enemy, and we suppose that the volunteers would hardly expect him to be chosen from among themselves. There are places beyond the sphere of action of the Fire Brigade, but yet almost forming part of London, where we believe the services of volunteers have proved highly valuable. In the country, of course, everybody lends a hand with or without a head to guide it. Graduates of Cambridge may remember a time when that town and neighbourhood were remarkable for numerous fires, and an excursion to a blazing farmyard became one of the regular amusements of the winter term. In a country town the custom is, or was, to enter the houses supposed to be in danger and remove the property to any other houses at a safe distance. When leisure came for the reclamation of this property, some pieces perhaps might prove to have gone irreclaimably astray. In London, if you pause near the scene of a fire, a policeman moves you on. In the country, if you do not hasten to give assistance, you are thought to want both courage and humanity. Between town and country lie the districts where volunteers supply more or less the place, and sometimes usurp the uniform, of the Fire Brigade. When Captain Shaw gave his evidence both the strength and the cost of the force which he commands were less than half of that which works excellently in Paris. Probably this proportion has been maintained, although the growth of London calls for more firemen every year. Skilled officers and well-trained men produce astonishing results. They cannot, of course, prevent fires breaking out, but they can and do arrest their progress. Dryden decorously assumed that the personal intervention of King Charles II. helped to stay the progress of the Great Fire of London. But nowadays both Court and city would prefer Captain Shaw to any other leader, however illustrious. It is a comfort to reflect that the Metropolitan Fire Brigade is one of the institutions of the country which nobody abuses at home, and every competent observer from abroad must admire. It owes its origin, as we have shown, to a voluntary association of Insurance Offices, and it is one of the most remarkable monuments of the capacity for organization of Englishmen not employed or impeded by Government.

THE OLD MASTERS AT THE ROYAL ACADEMY.

II.

THE gem of the collection is Raffaelle's "Agony in the Garden" (176). There are pictures more striking in effect, more grand and original in conception, and there are canvases or panels ten, nay twenty, times the size; but this little work is in its sphere faultless; we call it a gem because of its purity, its lustre, its perfection. Much might be written concerning the curious history and the matchless art of this representative work, mentioned by Vasari, and described in detail by Passavant. The picture was painted at Urbino about the year 1505; Raffaelle was twenty-one years of age, his father and mother were both dead; he had entered the school of Perugino, had made his first visit to Florence, and then returned for a brief space to his native city in the Umbrian hills, apparently because his good parents had left "his affairs in much confusion." These few biographical details give a clue to the carefully wrought work before us. It belongs to what, with some appearance of paradox, may be termed the præ-Raffaellite period of Raffaelle; in other words, it is almost identical with the works of his master. Indeed Vasari expressly states that at this period Raffaelle imitated with such exactitude the manner of Perugino that the difference between the work of the master and of his pupil could not be discerned with any certainty. "The Agony in the Garden," by Perugino, now in the Belle Arti, Florence, is more than analogous to, for in some parts, especially of the three sleeping Apostles, it is all but identical with, the composition now exhibited. Yet the authenticity of this composition seems established by the words of Vasari, who relates that the youthful Raffaelle, while abiding at Urbino, painted for Duke Guidobaldo "a small picture representing Christ praying in the Garden with three of the Apostles, who are sleeping at some distance, and which is so beautifully painted that it could scarcely be better or otherwise were it even in miniature." When Vasari wrote, the work was treasured as a sacred thing in the Hermitage of Camaldoli, Urbino; it then passed into the possession of Prince Gabrielli and was long in Rome, whence it was stolen and lost, but at length found in Germany, and, after a law-suit, recovered. In the year 1844 it was acquired by Mr. Woodburn; in the following year it passed into the possession of Mr. Coningham, and is now the property of the present exhibitor, Mr. Fuller Maitland. In the course of these recent changes of ownership it is known to have fetched the sum of 787*l.* 10*s.*, which is at the moderate rate of twenty-five shillings the square inch; under the amazing rise in prices of late years the value must be vastly augmented. The Garvagh Holy Family was purchased for the National Gallery at 9,000*l.* which is at the rate of more than 45*l.* to each square inch of panel. The picture now exhibited is, on the whole, in good preservation, yet writers who describe it say that some parts have been ill restored. We have given space to this "Agony in the Garden" because, as we have said, it stands as a representative product; it shows Raffaelle before his great change; it is at the antipodes to his latest work "The Transfiguration" in the Vatican; it retains the simplicity, the earnestness, the devotion which belong to the spiritual school of Umbria. In the Orleans Gallery there was an analogous composition.

In the Venetian school Titian again takes the lead. First comes "The Cornaro Family" (146), a spacious panorama, brilliant as a sunny day, dramatic as a group of richly robed senators on the stage. It would not be quite correct to say that the canvas has been covered carelessly or coarsely, and yet throughout the handling is rapid and broad almost to a fault; indeed some have surmised, though only on slight internal evidence, that Tintoret may have knocked in certain dashing passages. A picture of this somewhat routine character, displaying considerable inequalities, and scarcely in any part, save the two principal heads, rising to the pitch of Titianesque perfection, may well have been committed in a great degree to scholars, of whom Tintoret was one. The style too, as well as the general idea of the composition, bears some analogy to the masterwork of Veronese, "The Family of Darius," in the National Gallery; so true is it that a school like that of Venice, when firmly established in its principles and practice, is able to produce great works which represent not an individual only but a period, and embody as it were the collective genius of a community. This remark may be further enforced by the "Portrait of an Armed Man in Black" (143), a picture which, though it bears the name of Titian, might equally well be assigned to Morone. In fact, speculations as to the identity of the old masters are as endless as they are interesting; at the present moment criticism tends to scepticism—a reaction no doubt from the credulity which some time past put to the credit of a few great painters the countless products of pupils and imitators. Yet perhaps we cannot be far wrong in placing implicit faith in that lovely little figure, "The Lace-maker" (123). Titian here shows himself the great forerunner of Reynolds; indeed this charming conception might be fitly called "the age of innocence"; the child has the eyes of surprise, the quiet mouse-like manner, the timorousness, the half-awakening consciousness, which give indescribable charm to the children of Reynolds. Titian was never more delicate in pearly grey, not even in the dress of the famous "Flora" in Florence. Close by hangs one of the most slashing of portraits ever assigned to Tintoret (124), and the opposite wall receives decoration from the same exuberant pencil and glowing palette in a highly imaginative rendering of the "Baptism of Christ" (140). The picture was exhibited at Leeds. We have also seen a replica, possibly with variations, in a church at Verona. The composition has the accustomed impetuosity of the master; no genius was ever troubled with such unrest. St. John is of the size of a river god; cherubs rush in where angels fear to tread; the dove struggles in danger through storm clouds. Grand is the glory of the upper sky, and imagination takes free fling through space. We cannot credit Bonifazio—a master rare except in Venice—with the ridiculous medley called "A Pilgrimage to the Temple of Fame" (78). Neither can we inflict on Giorgione "A Lady and Boy of the Morosini Family" (145). Nor is it by any means sure that Paris Bordone could have painted, at least from the life, "Violante, Daughter of Palma Vecchio" (134). Bordone was born in 1500, and the lovely Violante was in her prime between 1516 and 1520. The style is here in the advanced manner of Bordone, who lived up to 1571; the blooming Violante, therefore, in all probability had grown into an old woman at the date of this picture. No head is better known; Palma and Titian again and again painted the lady, sometimes in company with her two sisters. On the whole, we incline to think the figure now on view a free version made by Bordone from Titian. The colouring is that of Bordone when he strove to imitate his second master, Titian, just as the colouring in a notable composition, "A Knight Arming" (227), is that of the same master when under the spell of Giorgione. Here the warrior is in grave mood, for he enters on solemn duty, and his comrades await his coming; a youth diligently buckles on his armour, and a black page holds his helmet. The canvas has doubtless darkened considerably, and yet we may be sure it was never light; the picture evidently having been carried out, as already said, in emulation of the more shadowy conceptions of Giorgione, wherein light loses itself in obscurity, and colour is mysteriously veiled as if glowing out of half-hidden depths. Colour so treated has great significance; it becomes expressive of thought and responsive to emotion.

Some interesting Spanish pictures come from the collection of the late Mr. Richard Ford, the well-known author of the Hand-

book which opened the Peninsula to English tourists. No man has written in a smarter way of Spanish art; we often have occasion to refer to his keen-sighted judgments. That the five pictures now exhibited prove a little disappointing may in some measure arise from the deplorable condition into which they have fallen. Of historic importance are the two portraits (116, 125), by Velasquez, of the first and second wives of Philip IV. The first scarcely bears out, we think, the words of Sir William Stirling-Maxwell:—"The beautiful Queen Isabella de Bourbon—Elizabeth of France, daughter of Henry IV. and sister of our Henrietta Maria—the first wife of Philip IV., was the star of the Court, and the loveliest subject of the pencil of Velasquez." And the exhaustive Catalogue to the "Annals" makes no mention of the picture now exhibited; it possibly is a replica. Mariana of Austria, the second Queen of Philip IV. (125), was, we are told, "a gay princess, prone to vex her solemn lord with girlish laughter"; the King, it is said, was never known to smile but three times in his life, which may account for the solemnity of his face whenever it appears in picture galleries. The portrait of the second Queen, now before us, was formerly in the Royal Palace at Madrid; it subsequently fell into the possession of General Meade, at whose sale in London in 1847 it was purchased for thirteen guineas—another proof of how vastly prices have changed within the last quarter of a century. From the collection of the Earl of Radnor come two noble figures which again show Velasquez the greatest of portrait-painters. To both works interesting stories attach. "Juan de Pareja" (141) was an intelligent, bright-eyed mulatto, with thick nose and lips, and curling black hair. At first he was the slave of Velasquez; he cleaned the brushes, ground the colours, set the palettes, and swept out the studio. But at length he learned to use the brushes he washed, and the King one day, discovering in the painting-room a picture by the poor colour-grinder, turned to Velasquez, and said, "You see that a painter like this ought not to remain a slave." Velasquez immediately gave to his faithful servant freedom, together with all the educational advantages of his studio. We know of two very creditable works by Pareja, severally in the Galleries of Madrid and St. Petersburg. "The calling of St. Matthew" in the former contains the artist's own portrait. We dwell on these biographical incidents because Pareja, whose swarthy physiognomy we have now the opportunity of studying, is the only historic indication that a mulatto and a slave is capable of becoming an artist of renown. Yet Pareja was little more than a copyist; his portraits, in fact, are so far imitations as to have been mistaken for the work of Velasquez. Of no less interest in the story of Spanish art is the portrait of Admiral Pareja (149), also by Velasquez. The picture is said to have been painted with brushes of unusual length, and certainly the figure tells with amazing power and life-like presence at unusual distance. It is related that Philip IV., taking his accustomed lounge through the painting room where the full-length portrait stood, exclaimed, "What, still here my admiral!" and receiving no reply, turned to Velasquez and said, "I assure you I was taken in." "Signing the Marriage Contract between the Infanta Margarita Maria, daughter of Philip IV., and the Emperor Leopold" (86), seems doubtful; possibly the figure of the Infanta is a first rubbing in by the master. A more veritable work, though not mentioned by Sir William Stirling-Maxwell, is "A Woman making an Omelette" (92). The intense realism and individualism in detail and in character place this life-like scene in the same category with "The Water Sellers" in Apsley House. The pictures of Murillo, though professedly six in number, are of comparatively slight worth; "Ruth and Naomi" (152) is the best, and undoubtedly genuine. We cannot close the Spanish school without directing attention to an impressive work, "Christ Bearing the Cross" (104), a signed canvas by Francisco Ribalta, a painter of Valencia, who formed his style in Italy under the posthumous influence of Raffaelle. But Spanish artists emulate Italian painters with a difference; they are uniformly dark, draped, and devotional; and such is the aspect of this "Christ" heavily laden under the burden of the Cross. It were interesting to compare, by means of engravings, photographs, or otherwise, the picture now exhibited with the analogous work in the chapel of Magdalen College, Oxford—a composition which, under the absolute ignorance which in England formerly prevailed even in high places, has been successively assigned to Titian, Ludovico Carracci, Guido, Morales, and one of the two Ribaltas. The signature to the picture now in the Academy, if it can be established as veritable, may go far to solve these historic perplexities.

Rubens is so well known, and has been so often passed under review, that the examples here presented need not detain us long. "The Artist's Son" (74) is better seen in Dresden; also in the same Gallery is a bacchanal scene superior to "Diana returning from the Chase" (207). Space, however, must be afforded for "Daniel in the Lions' Den" (131). That this masterwork is not by Snyders, as some have asserted, may be easily proved by comparison with "The Boar Hunt" (80), in the adjoining room. The handling of Rubens is free, liquid, and sketchy; the execution of Snyders, on the contrary, is hard, mechanical, and laboured. Besides, apart from internal evidence, "we know with certainty," writes Dr. Waagen, "that Rubens executed this picture entirely himself," the evidence being a letter written from Antwerp, wherein the painter says, "Daniel amidst many lions, taken from the life—original; the whole by my hand." Rubens is known as almost unrivalled in the delineation of animals; Sir Edwin Landseer is not his superior in action and in power. The two artists have measured their strength within the walls of the Academy; and the verdict is, that the lions of Landseer are tame, while the lions of Rubens are wild, angry, and ferocious as absolute monarchs of the forest. They grandly prowl around the terrified prophet; indeed Daniel serves but as an excuse for throwing the ravenous beasts into dramatic action.

REVIEWS.

GUBERNATIS'S ZOOLOGICAL MYTHOLOGY.*

SOME little while ago the *Edinburgh Review* passed sentence of death on the so-called science of Comparative Mythology, and uttered a solemn warning against all the dreadful results which would inevitably follow from the adoption of its pernicious principles. Setting aside the plea that the genius of great poets is shown most of all in their power of transmuting the poorest materials into gold, and that their truthfulness and force in the analysis and description of human feelings are not only not called into question, but are indefinitely enhanced, if it should be proved that the rude forms hewn by them into shapes so exquisite really exhibited little or nothing of deep human feeling, the reviewer, speaking on behalf of Homer and Æschylus, of Shakspeare and Milton, laid his ban on all attempts to reduce to mythical phrases the stories of Helen and Achilleus, of Paris and Hektor. A process which called itself scientific and which might possibly invade even the sacred circle of the dramas of Shakspeare was more than flesh and blood could bear; and the ease with which the process might be applied to some at least of Shakspeare's plays was without any misgiving insisted on as a conclusive reason for summarily rejecting the upstart science:—

> Othello [the reviewer ironically argued] is obviously a solar hero, and to the enlightened comparative mythologist the whole tragedy is a transparent solar myth. Some short-sighted critics have indeed supposed that Shakspeare meant to represent in this tragedy the working of human passions such as jealousy and revenge. But this is a complete mistake arising from the non-recognition of the Vedic element which constitutes the essence of all real tragedy.

The science, in short, was by the confession of its upholders a mass of absurdities. The mythical beings of the Vedic hymns were not only vague and shadowy, but both they and their attributes were interchangeable. Professor Max Müller had himself admitted that the same God is sometimes regarded as supreme, sometimes as equal, sometimes as inferior to others, and no sane man would waste time on material so worthless. The supposition that the subject and framework of poems so full of human feeling as the Iliad and Odyssey could have been furnished by phrases which described originally the phenomena of the heaven and the earth drew down even a more severe censure. It was urged that physical phenomena are, and always were, destitute of those elements of interest which must lie at the root of every great poem; and the notion of dramatizing a law of nature was dismissed as absurd and self-contradictory.

If this hard knock could slay the new science, it was perhaps well that the blow should be given; but the assertion of its apparent absurdity as a conclusive ground for condemning it lost somewhat of its force for those whose thoughts turned to the history of astronomy; while the absurdity of dramatizing a law of nature ceased to impress those who remembered that the notion of laws of nature had in the mythopœic ages no existence, and that the supposed lack of interest in physical phenomena is contradicted by many of the most splendid or most touching poems of the greatest poets whether of England or of any other country. Time, it would seem, is already beginning to work its revenge; and the very ark of the Shakspearian drama has been touched by scholars who are not comparative mythologists, and who do not even profess to be mythologists at all. Such students have not been afraid to say that, for some at least of his plays, Shakspeare employed materials obtained from the great storehouse of Aryan myths, and that the drama for the framework of which he is most indebted to these myths is the one marked perhaps beyond all others for the play of the truest and deepest of human feelings—*Hamlet*. The fact that Shakspeare worked from a German model, and that in this model the mythical origin of the story is clearly brought out, cannot be put out of sight; and the shadowy nature of the hero himself has been exhibited most forcibly by a writer who, seeking only to ascertain how far Hamlet belongs to a family which had an historical existence, found that almost every name with which he is connected is the subject of myths common to most or all branches of the Aryan race, that the method of Hamlet's death agrees precisely with that of his father, and that the incidents are found in many other stories of mythical heroes. The diggers in the field may seem to approach perilously near to Othello; but whatever may be the fate of the swarthy Moor and his fair-haired love, the framework of another play of the great English dramatist has in the meanwhile been traced to distant lands and ages by an Italian scholar in a work which marks another stage in the history of mythological research. In the stories of Dirghatamas and Yavâtis, Professor Angelo de Gubernatis discerns King Lear in

* *Zoological Mythology; or Legends of Animals.* By Angelo de Gubernatis, Professor of Sanskrit and Comparative Literature in the Istituto di Studii Superieri at Florence. London: Trübner.

embryo. Cordelia is here the third son, who consents to become old in his father's stead when his two elder brothers refuse, or, in another version, the youngest child who remains with his parents when these have been driven from their home by the elder children.

But the real significance of this very able work lies elsewhere. It is not our intention to pronounce definitely whether the conclusions of the author are right or wrong; but we may acknowledge at the outset the vast learning and the patient care with which he has accumulated and classified in these remarkable volumes a vast store of materials, and the vigour which may carry the reader through his whole book with almost unflagging interest. By first publishing his work in an English dress, which only in a few stray words or expressions betrays the fact that we are reading a translation, Professor Gubernatis has chosen to address himself chiefly to English scholars; and it will not speak well either for their patience or for their impartiality if they fail to weigh carefully the evidence here brought before them. This evidence may be said to bear practically on one point, that point being the one on which for some time past the whole controversy on the comparative theory has been turning. With the *Edinburgh* Reviewer the flexibility of the materials said to be employed in the formation of myths was a sufficient reason for rejecting as absurd the conclusions of comparative mythologists, and for denying the possibility of the science. With Professor Gubernatis this flexibility alone renders the existence of myths possible; and, to say the least, the reader who has gone through these volumes must feel himself almost overwhelmed by the vast array of facts which he must pass under review before he can attempt to reject the proposition as unproven. The author's task has been to deal first, not with the great epic poems and epical heroes and actors, whether of the Eastern or Western world, but with the vast multitude of beasts, birds, and fishes which figure in those poems and traditions. This strange throng, which exhibits innumerable shapes, beautiful or grotesque, graceful or disgusting, lovely or fearful, is most numerous in the Vedic and post-Vedic literature of India. But if we call to mind a few only of the old Greek myths, we shall see at once how large a part these creatures play in them; and yet probably until the question is forced on their notice, not many will have thought it a matter calling for any serious thought. Yet we can scarcely be justified in dismissing it in any offhand fashion, when we have the eagle of Zeus and the owl of Athênê, the horses of Achilleus and Poseidon, the ass of Seilenos and the ass's ears of Midas, when we find Athênê changing herself at will into a bird, and Io changed into an heifer, when we see the boar in the stories of Atys, Adonis, Meleagros, and Odysseus, the terrible Minotauros in the myth of Theseus, and the fire-breathing bulls in that of Medeia. In short, we soon learn that there is scarcely a myth in which bird, beast, or fish may not be found. In the Homeric hymn Apollon throws himself into the sea in the form of a dolphin, and, having guided the Cretan ship to the shores of Krisa, comes out from the waters like a star. In the story of Aristaios the fish-god is seen as the preacher of wisdom, and as a deliverer in that of Arion. As to serpents and dragons, they are everywhere—as noxious beasts in the myths of Phoibos, Kadmos, or Herakles, and in beneficent aspects in the stories of Iamos and Melampous. Dionysos can change himself into a bear or a lion; Lykaon is changed, against his will, into a wolf; Arachne into a spider; Philomêla and Prokne into the nightingale and the swallow. The golden ram carries Phrixos and Helle from the land of Athamas; the three-headed dog guards the gates of Hades. Nay, we have strange unions between Leda and the swan, and heroes and heroines hatched from eggs, with horrible associations between men and horses or other beasts; and not only have we the marvellous changes by which Apollon and Athênê appear as crows, and Talaos as a partridge, but for many of these transformations, or for the manifestation of them, the times are definitely marked. In many cases, of two closely connected beings one only may be seen at a time; in many others, one change passes rapidly into another, like the uncertain colours of a dream. It is only on comparing the Greek myths or traditions with those of other nations or races that our eyes are opened to the enormous range of this mythological zoology. Birds, beasts, reptiles, insects, fishes, here live in a world of their own, reflecting in greater or less degree the forms and habits of the animals of earth, yet never wholly like them; and thus we find ourselves in a labyrinth seemingly inextricable. So tangled is the wilderness and so strange are the creatures which inhabit it, that we may be tempted to look on the task of classification as one beyond human powers, until we see that the mythical zoology of the most distant nations has many, and these the most striking, features in common, and that, if this zoology be the growth of a diseased imagination, all nations have gone mad in precisely the same way, and there is therefore a method in their madness. What we are made to feel most forcibly is that, on whatever theory we are to explain the fact, the world into which we are introduced exhibits a series of incessantly and rapidly shifting scenes, in which the same objects, from different points of view, appear brilliant or dark, lovely or appalling. In short, the phenomena which we have to note are characterized by that flexibility which is so especially distasteful to critics like the writer in the *Edinburgh Review*. In this characteristic Professor Gubernatis sees the condition without which no myth would ever have come into existence. The myths which have branched off into the largest number of legends are, in his judgment, those which are founded on the most fleeting phenomena:—

> a continuous succession of shadows, penumbræ, chiaroscuri, and shades of light, from the black darkness to the silver moon, from the silver moon to the grey twilight of morning, which gradually melts into and confounds itself with the dawn, from the dawn to the aurora, from the aurora to the sun; the same variations occurring, but inversely, in the evening, from the dying sun to the reddish and blood-coloured sky or evening aurora, from the evening aurora to the grey twilight, from the grey twilight to the silver moon, from the silver moon to the gloomy night—this continual change of colours which meet, unite with, and pass into, each other, originated the idea of celestial companions, friends, or relations, who are now in unison and now separate, who now approach to love each other, to move together and affectionately follow each other, now rush upon each other to fight, despoil, betray, and destroy each other turn by turn; who now attract and are now attracted, are now seduced and now seducers, now cheated and now deceivers, now victims, now sacrificers.—I. 320.

In the lives of these companions, friends, rivals, or enemies, the birds, beasts, fishes, reptiles, and insects of the mythical world each fulfil a special office. Nay, these friends or enemies may themselves assume and again throw off these animal forms, and beasts are supposed to go through courses of action which are possible only for a man. The god Hanumant, the son of the bull or of the wind, appearing himself both as a bull and as an ape, receives as a reward from the King Bharatas a hundred thousand cows, sixteen wives, and a hundred servant-maids. As bull or ape, what, Professor Gubernatis asks, could he have done with them?—

> It is these inconsistencies [he adds] which have caused mythology to be condemned by the crowd of old but prolific pedants as a vain science, whereas, on the contrary, it is precisely these inconsistencies which raise it, in our esteem, to the rank of a valid science. He who handed down to us the feats of Hanumant took care also to tell us how he had the faculty of changing his form at will; and this faculty, attributed to this impersonation of a celestial phenomenon, is the fruit of one of the most *naïve* but just observations of virgin and grandiose nature.—I. 90.

This sentence may not accurately represent the author's meaning: but the defects of translation (and in these volumes they are few indeed) cannot invalidate his claim to a hearing; and this hearing he challenges for a proposition which certainly cannot be charged with being either indefinite or indistinct. His first book bears the title of "Animals of the Earth," the second of "Animals of the Air," the third of "Animals of the Water": but he holds that there is but one domain in which all the animals of mythology are produced and play their several parts:—

> This domain is always the heavens, whilst the time during which the mythical action lasts is subject to many variations, being now the day of twelve hours; now that of twenty-four; now the three watches of the night; at one time the lunar month of twenty-seven days, at another the solar month of thirty; sometimes the year of twelve solar, and sometimes that of thirteen lunar, months.—I. p. xvi.

When to these variations are added the changes of phase incessantly going on in the heavens, we seem to lose ourselves in a boundless region where the human imagination may run riot without check. It remains to be seen whether the innumerable images thus produced may be brought into order, and whether the classifications yield results which may be regarded as adequate foundations for a science. For the present we will only remark that, as furnishing materials for the comparative mythologist, the Slavonic traditions are placed by Professor Gubernatis above the Greek. The former in his belief have undergone no change for perhaps three thousand years, while the Tatar himself, a great teller of stories, only increased the taste of the Slavonic peasant for tales, and did not change his legends or his character. In short, the Tatar stories, he maintains, are the Aryan tales themselves, only a little modified by a few Tatar peculiarities. The reader who may wish to see how far the judgment of Professor Gubernatis is confirmed by an independent witness, will find a large amount of mythical zoology in Mr. Rawson's *Songs of the Russian People*.

A LADY OF THE LAST CENTURY.*

IN spite of our self-complacent sense of progress, there is one quality in which we are forced to own ourselves falling short of our forefathers. We cannot read the social history of the last century without feeling that they beat us hollow in the article of vivacity. And this is an admission which carries us further than at first seems, or than is altogether agreeable; for can wit exist without it? It is this quality which makes book-making out of eighteenth-century biography easy writing, and, when written, easy reading. It is not new; we are sure, in fact, that we have read it all somewhere before; but we find ourselves in cheerful company. We open upon a page when society was young—"Ah, woful when!"—and people knew how to entertain each other; and we are entertained at second-hand, though saddened by the contrast, as we range over our acquaintance—able and well informed people probably, but not lively; or we more reasonably ask, each one of himself, Falkland's question—Am *I* the life of the company? which each member of the historical circle was in his turn.

The heroine of Dr. Doran's present book, *A Lady of the Last Century*, is a typical representative of this distinguishing quality. Vivacity, as the characteristic of an age, is a vigorous thing, implying strength—strength of body, mind, and nerve. The vivacious ladies who figure in the history of the period lived long and actively; they danced, they talked, they wrote, they managed their households, and were quite equal to guide themselves and their affairs, and as long as they lived they enjoyed a good laugh. Pre-eminent for this liveliness

* *A Lady of the Last Century: Mrs. Elizabeth Montagu.* Illustrated by her Unpublished Letters. By Dr. Doran. London: Bentley & Son. 1873.

and buoyancy of spirit stands Mrs. Montagu, who on this account alone deserves to be resuscitated by a new volume in her honour. As a child she baudied repartees with her father till he retired discomfited from the contest; her "elegant vivacity" is the theme of her friends, to whom her variety was a constant surprise; her letters are full of spirited comment and happy turns. She carried all she had learnt at her tongue's end. Her conversation won the highest praise from Dr. Johnson for its life:—"That lady exerts more *mind* in conversation than any person I ever met with. Sir, she displays such powers of ratiocination and radiations of intellectual eminence as are amazing." And this vigour and sprightliness lasted her through a long life.

It may be that the deeper and wider view of responsibility enforced upon society, at least in words, by teachers of all schools in our day, is a salutary check on minds open to such influences. We do not pretend to put forward this cheerful, prosperous lady as an example to her sex; it might have been for her good now and then to let the troubles of the world take a stronger hold of her heart and fancy than they seem to have done. She represents an age which did not affect deep views; the inequalities of human society were a fact which it did not feel called on to rectify on a subversive scale. Her rule of conduct marks the prevailing tone:—"My business is to make the best of things as they are"—and "things" certainly arranged themselves with an extraordinary eye to her convenience. But she had the art of making her convenience fall in with the general happiness, as Hannah More's testimony, written some years after her death, shows:—"Her fine qualities were many; from my first entrance into London life till her death I ever found her an affectionate, zealous, and constant friend, as well as a most instructive and pleasant companion." She had a temper to make the most of her gifts; it helped her to a career; which even beauty, birth, health, wit, and wealth, without it, are not enough to win for a woman. Even her errors were lucky; they were follies and affectations, not faults of temper or more fatal imprudences in business or conduct, the usual pitfalls of a brilliant fortune. It is not Dr. Doran's part to describe these affectations, but they were so far of the nature of "Queen Elizabeth's" foibles that they never interfered with her main interests. A strong sense was the basis of her character, regulating all the leading actions of her life. As a beauty and wit, she endured the crucial test of a crowd of lovers, from whom she chose a rich commoner of good birth and understanding and great wealth, to whom she made a good wife, though his death certainly cast no lasting gloom on her spirits. He left her his whole fortune and estates. These estates she managed with a vigilant prudence apart from meanness and suspicion. She manifests a remarkable enjoyment in possession. The word *my* is as conspicuous in her letters as the "I" of egotism in some people's. But *my* tenants, *my* agent, *my* labourers, *my* colliers, *my* servants, all gain by the connexion with herself, and are good of their kind. Even building on a large scale (her mansion in Portman Square) does not disturb this complacency. "If it were not that a house must be building before it can be built, I should never have been a builder," but "I have never had a quarter of an hour's pain or pleasure in the operation. I have not met with the least disappointment or mortification. It has gone on as fast and well as I expected, and when it is habitable I shall take great pleasure in it." Not even pay-day tries her equanimity. She owns a wonderful charm in "a receit" *in full of all demands*, and "my house never appeared to me so noble, so splendid, so pleasant, so convenient, as when I had paid off every shilling of debt it had incurred." She finds the same enjoyment in the achievements of the "celebrated Mr. Brown" ("Capability Brown"), who lays out the grounds of her country house:—"As fast as time wrinkles my forehead I smooth the grounds about Sandleford, or embellish my town habitation. In a little while I shall never see anything belonging to me that is not pretty, except when I behold my face in the looking-glass."

This was written in 1779, and the writer was born in 1720. It tells much for the quality of her vivacity that it should thus have stood the wear and tear of all but threescore years. The letters which give the occasion for this volume are of a later date than any yet published, taking up her correspondence at the date 1761, where the two previous series of her letters end. One of these was published by her nephew and heir, Matthew Montagu, in 1808, when they won Windham's warm praise for variety of thought and ease and sparkle of style; and the next was universally well received in 1813. The last forty years of her life have remained unrecorded until this publication of a correspondence with her sister-in-law Mrs. Robinson, and other friends, bought years ago at a sale of autographs by Mr. R. Bentley. It retains all the qualities of her earlier style, and, as a record of the sayings and doings of fine people just a hundred years ago, furnishes some pages of pleasant, suggestive light reading to our sadder, and it is therefore assumed wiser, generation.

When people are called affected by their friends there is no doubt something in it, though our own observation leads to the paradox that some persons are naturally affected. Vivacity often incurs the charge. The impulse to express oneself and entertain others becomes a habit, and habit does not always wait for the inspiration of the moment. Mrs. Montagu's elegant vivacity was probably often forced; but it is to be added that she hit out new modes while her friends were content with well-worn affectations. On referring to Mrs. Delany's correspondence, it is amusing to find Mrs. Boscowen, in a jargon of mixed French and English, commenting on "the sketch you gave me of Madame *de* Montagu, 'qui n'est que trop ressemblante,' and much I *fear* that she will *never* be Mrs. Montagu again! I wish she would learn by heart her friend Mrs. Chapone's chapter on simplicity, which surely is a better thing than egotism or boasting, or affectation of any kind; but how *little temptation* has she to *affect* anything when she has *such* natural endowments! but so it is, and I own I apprehend qu'elle reviendra de ces courses *tout-à-fait gâtée*." This was the tone of the day; but when Mrs. Montagu, to express that she had shut herself up for one whole day from interruption, called herself "hermetically sealed," the phrase was treasured for repetition by Horace Walpole. It was clearly a new idea to introduce scientific terms into everyday language. The courage of this lady was one of her striking qualities, whether in the choice of a word or of an antagonist. When Voltaire attacked Shakspeare, she wrote an essay in defence of our poet which had an immense success, though Johnson's surly judgment—"I will venture to say there is not one sentence of true criticism in the book"—is likely enough to be true. And her tongue was as ready as her pen. When she was told that Voltaire had boasted, "C'est moi qui autrefois parlai le premier de ce Shakspeare. C'est moi qui le premier montrai aux Français quelques perles que j'avais trouvées dans son fumier," she charged him at once with plagiarizing from this dunghill:—"Ah! c'est un fumier qui a fertilisé une terre bien ingrate." And later, when she was present at the Academy at the reading of a furious paper against Shakspeare by Voltaire, and a Frenchman, affecting to pity her confusion under the blow to her countryman's fame, said, "I think, madam, you must be rather sorry at what you have just heard," she promptly replied, "I, sir! not at all. I am not one of M. Voltaire's friends."

Among the humours of that day was the giving of names to the familiar members of each high circle. And Mrs. Montagu in her bright girlhood was styled Fidget by her friend the Duchess of Portland, in recognition of her great activity of mind and body. She took to the title. Speaking of an old-fashioned table, she wrote, "Why so many legs should be required to stand still whilst I can fidget upon two, I own surprises me." Wherever she went she kept her observation on the alert, and was uttering sayings which were quoted by her friends. Thus she pronounced Spa, where she was staying with a bevy of wits, "The Seven Dials of Europe." At Utrecht she is amazed at the stolidity of the Dutch exterior, and "had never had any complete idea of what was meant by *stock still*" till she came to Holland. Bath life she described as consisting all the morning of "How d'ye does?" and all the night "What's trumps?" One of the over-dressed ladies at Tonbridge "is a state bed running on casters." Writing from Yorkshire, where the vice of drinking prevailed, she says, "I do honestly thank my stars that I am not married to a country squire or a beau; for in the country all my pleasure is in my own fireside, and that only when it is *not littered with queer creatures*. Could you but see all the good folks that visit my poor tabernacle, your grace would pity and admire." This, however, is an extract from her earlier correspondence. Satire is a youthful foible. She grows in good nature as she gets older. We read elsewhere her reflections on the changes time brings:—"I cannot say that as one grows older one grows so much wiser as to despise foolish amusements, but one likes new kinds of follies. I mean one always likes some of those things severe and frowning wisdom calls follies." But her sympathy with the pleasures of the young never failed. The following upon minuets throws a light upon the feelings of our forefathers:—

> I approve much of your getting up a dance once a week for the young folks, and I am particularly glad my nephew is of the party. Grace of person is of more consequence to a woman than a man; but the capacity for dancing a minuet is more serviceable to a young man; for, by so doing he obliges many young ladies, while the minuet miss seldom pleases any girl but herself. Unless a girl is very beautiful, very well shaped, and very genteel, she gives little pleasure to the spectators of her minuet; and indeed so unpolite are the sitters-by in all assemblies, that they express a most ungrateful joy when the minuets are over. For my part, though I feel as great *ennui* as my neighbours on those occasions, I never allow myself to appear so; for I look upon a minuet to be generally an act of filial piety, which gives real pleasure to fathers, mothers, and aunts. . . . . In France good minuets are clapped; but I believe no nation arrived at such a degree of civilization as to *encore* them.

A full appreciation of the good things of life and their uses gives a point to gossip in her hands. "There is a report," she writes, "that Captain Darby is going to be married to a widow with fourscore thousand pounds. It seems her first husband was a good-humoured, quiet, dull man. Elle s'en trouvait bien, and is going to take such another; but still, fourscore thousand pounds is a great price for a dull man" In 1772 we find her visiting Mr. and Mrs. Burke, and regretting that she can only afford one day; for when "the talents of a man of genius, the acuteness of a politician, the alert vivacity of a man of business, are all employed to make conversation agreeable and society pleasant, one passes one's time very delightfully in such company"; and it is clear that in her presence every one talked his best.—

> At Beaconsfield Mr. Burke is an industrious farmer, a polite husband, a kind master a charitable neighbour, and a most excellent companion. The demons of ambition and party who hover about Westminster, do not extend their influence as far as the villa. I know not why it is, but these busy spirits seem more tranquil and pleased in their days of retreat than the honest dull justice of the quorum, who never stretched forth his hand to snatch the sceptre of power, or raised his voice in public to fill the trumpet of fame. A little mind is for ever in a tracasserie, because it is moved little things. I have always found that nothing is so gentle as the out of war, nor so serene and simple as the statesman out of place.

But with all her appreciation of great men, she and Johnson

not hit it. He irritated her by his criticism of her great friend Lord Lyttelton's poems, and by the epithet "poor Lyttelton!" which he did not remove at her objection: and probably, in spite of the homage of many fine compliments, sincere when he uttered them, there was something about her that irritated him. His candour shines out in the following passage:—

Notwithstanding this offence, Mrs. Montagu subsequently invited Johnson to dinner, but she could not treat him with her old cordiality, nor would she fall into conversation with him. General Paoli sat next to the Doctor. Johnson turned to him and remarked, "You see, sir, I am no longer the man for Mrs. Montagu!" He was not indifferent to this condition of things. "Mrs. Montagu, sir," he afterwards said to a friend, "has dropt me. Now, sir, there are people whom one should like very well to drop, but would not wish to be dropt by."

We find casual allusions to politics, especially in the letters of Mrs. Scott, Mrs. Montagu's sister, and extremely like her in person and mind. The fine ladies of that day allowed themselves a freedom of speech which Dr. Doran scruples to perpetuate in his heroine; but Lady Townsend is permitted to express her opinion of public events in her own way. Thus, of the creation of peers soon after George III.'s accession, "You will find few commoners in England. We make nobility as fast as people make kings and queens in Twelfth-night, and almost as many. Lady Townsend says, she dare not spit out of her window, for fear of spitting on a lord." Mrs. Montagu was really too grand and too rich to be only and simply a fine lady. The dignity of landed property gave her nobler interests. She speculates on the condition of the labouring class, and wished to mend it:—"I have forty reapers at work, to take advantage of the fine weather. I brewed seven hogsheads of small beer for them, and fear it will not last till the end of harvest. The poor reapers and haymakers bring nothing but water into the fields, which, with bad cheese and fine white bread, is their general fare. I think our Northern people are much more notable. Their meals are more plentiful and less delicate; they eat coarse bread, and drink a great deal of milk, and have often salt beef." These Northern people have improved their fare since this was written. The Yorkshire reaper has now his three meals of meat a day at his master's expense. In a letter of the year 1762 we find a curious illustration of the political fever of that date caricatured in Murphy's farce of the *Upholsterer*. "The lowest artificer," writes Mrs. Montagu, "thinks now of nothing but the constitution of the Government. If you order a mason to build an oven, he immediately inquires about the progress of the peace, and descants on the preliminaries."

Of Dr. Doran's editorship there is not much to be said. The times which his book illustrates have been so long and so curiously sought into that we ought not to complain if we seem to have read some of his pages before. The book has enough interest to lead the reader on at whatever page he opens, and he will scarcely lay it down without the reflection that the eighteenth century understood the art of amusing itself in a degree which the nineteenth century has lost.

STEPHEN'S EDITION OF THE INDIAN EVIDENCE ACT.*

THERE is no reason to suppose that the Indian Evidence Act, of which an edition has just been published in this country by Mr. Fitzjames Stephen, with a remarkable Introduction, could be at once transferred to the English Statute-book; but it may furnish some valuable lessons to English lawyers and legislators. The minority (it is to be feared the small minority) of the English legal profession and of the English public who take an interest in the subject appear to have now abandoned the idea that there would be any material advantage in having a Digest of the English law prepared, and they seem to be agreed that what is wanted is a Code. A Digest is here understood as a re-statement of the law in consecutive propositions, possessing no authority except that which belongs to its framers; a Code is a re-statement of the same nature invested with the authority of a legislative enactment. But this Indian experiment clearly shows that a Chapter on Evidence in an English Code which should be nothing more than an enacted Digest would be in the highest degree unsatisfactory, and indeed grotesque. The labour of thinking out the first principles of each branch of the law, of stating them intelligibly, and of basing on them an orderly arrangement of the whole subject, cannot in fact be saved or avoided. It is very easy to show to what extent this assertion is true of the English law of evidence. Any statement of the law which servilely followed the method of a Digest would begin by laying down that (1) all facts which supplied inferences of any sort regarding the matter in dispute might be put in evidence, and then it would proceed to lay down the exceptions to this general rule. One of these exceptions would be that (2) the statements of persons not called as witnesses, which they have made to others, cannot be received as evidence; and to this last rule there would be one further exception among others, in the case of (3) statements made by a person since dead concerning the cause of his death. Now it happens that the great bulk of the English law of evidence consists of rules belonging to the class to which rule (3) belongs, and therefore, if framed on the principles of which we are speaking, the chapter of the Code which dealt with evidence would declare the law to consist of a number of sub-exceptions to exceptions to a general rule. The clumsiness and inconvenience of such a method require no demonstration, and it is a palpable merit of the Indian Evidence Act that it at least cuts the chain down from three links to two. It considers facts, in their relation to other facts, as possessing a quality which it calls "relevancy," and which is capable of description in general language. The "relevancy" of facts is their capacity for supplying to the mind an inference concerning the existence or non-existence of other facts. The most important part of the Act consists of rules for defining and determining the "relevancy" of various classes of facts, and to these rules the exceptions are comparatively few. And of all such rules the widest and most important are those stated in Sections 7 and 11:—

Facts which are the occasion, cause, or effect, immediate or otherwise, of relevant facts, or facts in issue, or which constitute the state of things under which they happened, or which afforded an opportunity for their occurrence or transaction, are relevant. . . . . Facts not otherwise relevant are relevant if they are inconsistent with any fact in issue or relevant fact, or, if by themselves or in connexion with other facts, they make the existence or non-existence of any fact in issue, or relevant fact, highly probable or improbable.

A very recent critic of the new Indian law has objected to the above provision, and to others of equal width, that, from their extreme generality, and from the difficulty of applying them, they are calculated to leave in the hands of the judge a practically unlimited power of admitting or rejecting evidence. The observation curiously illustrates the habit of mind produced in English lawyers by the mode of argument of which the accustomed form is, "My lord, your lordship will find that similar evidence was admitted (or rejected) in Jones *v.* Smith." But the truth is, it is altogether wide of the point. The Indian Evidence Act is intended for application in India, and Sir H. Maine, in a paper just published in the *Fortnightly Review*, has clearly shown why an explicit statement of the law in general propositions was urgently needed in that country. The Indian judge is judge both of law and of fact, and the power left in his hands is a power over the formation of his own mental conclusions. It is fairly arguable that a judge in such a position might be left unshackled by any law of evidence; but such a liberty would be practically irreconcilable with the correction of decisions by Courts of Appeal, and would be especially liable to abuse in a country in which an officer of Government is occasionally compelled, in political emergencies, to attach importance to the merest rumours. What was obviously needed was to relieve the judge from the necessity of estimating the value of objections founded on a reference to "Jones *v.* Smith," of which no report was perhaps accessible within a thousand miles distance, and to prevent the conclusions of the only man who had been in personal contact with the witnesses from being overruled by an Appellate Court as irreconcilable with technical rules to which he had practically no access. We can easily understand, too, that, as the *Fortnightly* asserts, the enforced obedience to a system of rules which English lawyers pick up as they go, and apply by a sort of knack, was exercising an enfeebling influence on the minds of a service which, at critical times, has to act under circumstances when nobody but a fool or pedant would dream of estimating probabilities by a technical rule.

The Act itself, most instructive as it is, must doubtless undergo considerable alteration before it can be made to serve as the Chapter on Evidence in the English Code; but the Introduction which Mr. Stephen has prefixed to it deserves to be studied by all beginners in the Law of Evidence, whatever form be given to it, and ought to interest a much larger class. Among the few books which have been written in our language on the theory of judicial evidence, there is hardly a good one. The one which has most reputation is the work of the late Mr. Best, of which Lord Wensleydale is said to have observed that more thought had been put into it than into any law-book he knew. If this praise was deserved, we are afraid we must assert that a great deal of the thought was wasted, as indeed was not a little of that which passed through the powerful mind of Lord Wensleydale himself. For Mr. Best nowhere shows that he apprehended the truth which Mr. Stephen has firmly grasped—the identity in principle of judicial and of inductive scientific investigation. The general problem both of science and of judicial inquiry is to discover, collect, and arrange true propositions about facts. "Facts," Mr. Stephen argues, are sufficiently described by the definitions of the Indian Evidence Act, in which a "fact" is (1) any thing, state of things, or relation of things capable of being perceived by the senses; and (2) any mental condition of which any person is conscious. A proposition, he continues, is "a collection of words so related as to raise in the minds of those who understand them a corresponding group of images or thoughts"; and a true proposition is "one which excites in the mind thoughts or images corresponding to those which would be excited in the mind of a person so situated as to be able to perceive the facts to which the proposition relates." How then are we to proceed in order to ascertain whether any given proposition about facts is true, and in order to frame true propositions about facts? After stating that the facts must first be correctly observed, and then be recorded in apt language, and justly insisting on the delicacy and difficulty, little as they are usually recognized, of both these operations, Mr. Stephen goes on to show that the method of applying observation and language to inquiries into matters of fact in the court of justice and in the stud, or laboratory is identical. It is constituted in both cases by the processes of induction and deduction. A fixed order is

---

he Indian Evidence Act. With an Introduction on the Principles of al Evidence, by James Fitzjames Stephen, Esq., Q.C. London: Macmillan & Co. Calcutta: Thacker & Co. 1872.

first recognized both in nature and human conduct, and according to this order certain things are invariably related together as antecedents and consequents. What particular consequents are thus related to what particular antecedents is established by induction; and, in the case of human conduct, not by direct observation, but by the processes called by Mr. Mill the Methods of Agreement and Difference. The general proposition established by induction is used as a premiss from which consequences are drawn according to the rules of logic, and the inference, as to what must follow under particular circumstances, is compared with the facts observed; and if the result observed agrees with the deduction from the inductive premiss, the inference is that the phenomenon is explained. The explanation is equally valid whether the movements of the heavenly bodies are traced to the force of gravity, or whether a group of facts, of which one is the discovery of a woman's body with the throat cut, is accounted for by A. B.'s having cut it in order to facilitate his stealing her jewels. Mr. Stephen spares no pains in describing and illustrating the mode of reasoning in each class of cases. Among five *causes célèbres* which he has abridged, the trial of Palmer for the murder of Cook is pre-eminently instructive. The actual administration of poison to the deceased was seen, it will be recollected, by nobody, and the result was established exclusively by inference from a number of relevant facts. There is no step of the scientific mode of reasoning through induction and deduction from the known to the unknown which does not receive illustration in some part of the proceedings at that celebrated trial.

Mr. Stephen is careful to point out to his readers that, though the mode of proceeding in scientific and judicial inquiry is identical, the situation of the judge differs materially from that of the man of science as regards facilities for prosecuting the inquiry successfully. The facts of human conduct, relatively to our powers of ascertaining them, are on the whole much more obscure and intricate than the facts of nature. To every assertion made about nature there is generally a whole cloud of witnesses corroborating one another; to many assertions about conduct there is but a single witness, incapable of being contradicted, and occasionally with strong motives for making false statements. But the great point of inferiority in judicial investigation is the almost total lack of the power which the experimentalist possesses of multiplying experiments—or, in other words, the facts from inferences are to be drawn—without limit or at pleasure. When a former Lord de Ros was accused of cheating at cards, a well-known baronet of the day, who was summoned as a witness, performed, in the sight of judge and jury, the feat of "turning the king," and this was a nearly solitary instance of obtaining that sort of security for a sound judicial conclusion which the man of science has always and absolutely at his command. Still, with all these disadvantages, there is one very great advantage in judicial inquiry. The judge, whether technically called by that name or serving as a member of a jury, has in his own breast a store of experience which enables him in a great degree to correct and complete the reasoning essential to a valid conclusion. General rules about human conduct are only true in the rough, but then these approximate rules are chiefly collected from each man's own experience of what passes in his own mind, confirmed by his observation of other persons' conduct, which he can only interpret by assuming that there is substantial identity between their mental processes and his own. This circumstance, says Mr. Stephen,

> invests the rules relating to human conduct with a very peculiar character. They are usually expressed with little precision, and stand in need of many exceptions and qualifications, but they are of greater practical use than rough generalizations of the same kind about physical nature, because the personal experience of those by whom they are used readily supplies the qualifications and exceptions which they require. Compare two such rules as these:—"heavy bodies fall to the ground," "the recent possessor of stolen goods is the thief." The rise of a balloon into the air would constitute an unexplained exception to the first of these rules, which might throw doubt upon its truth, but no one would be led to doubt the second by the fact that a shopkeeper doing a large trade had in his till stolen coins shortly after they had been stolen without having stolen them. Every one would see at once that such a case formed one of the many unstated exceptions to the rule. The reason is, that we know external nature only by observation of a neutral, unsympathetic kind, whereas every man knows more of human nature than any general rule on the subject can ever tell him.

From the many sagacious observations which Mr. Stephen's introduction contains we select those which follow on the common opinion that the inference from the assertion of a witness to the truth of the matter asserted is "an easy matter, calling for no remark":—

> To infer from an assertion the truth of the matter asserted is in one sense the easiest thing in the world. The intellectual process consists of only one step, and that is a step which gives no trouble, and is taken in most cases unconsciously. But to draw the inference in those cases only in which it is true is a matter of the utmost difficulty. If we were able to affirm the proposition, "All men upon all occasions speak the truth," the remaining propositions—"This man says so and so," "Therefore it is true," would present no difficulty. The major premiss, however, is subject to wide exceptions, which are not forced upon the judge's attention. Moreover, if they were, the judge has often no means of ascertaining whether or not, and to what extent, they apply to any particular case. How is it possible to tell how far the powers of observation and memory of a man seen once for a few minutes enable him, and how far the innumerable motives by any one or more of which he may be actuated dispose him, to tell the truth upon the matter on which he testifies? Cross-examination supplies a test to a certain extent, but those who have seen most of its application will be disposed to trust it least as a proof that a man not shaken by it ought to be believed. A cool, steady liar who happens not to be open to contradiction will baffle the most skilful cross-examiner in the absence of accidents, which are not so common in practice as persons who take their notions on the subject from anecdotes or fiction would suppose. No rules of evidence which the legislator can enact can perceptibly affect this difficulty. Judges must deal with it as well as they can by the use of their natural faculties and acquired experience, and the miscarriages of justice in which they will be involved by reason of it must be set down to the imperfection of our means of arriving at truth. The natural and acquired shrewdness and experience by which an observant man forms an opinion as to whether a witness is or is not lying, is by far the most important of all a judge's qualifications, infinitely more important than any acquaintance with law or with rules of evidence.

The interesting question which is raised by Sir H. Maine's paper, whether the English rules of evidence can ever be completely understood, save as exceptions to broad rules excluding testimony, we reserve for discussion on a future occasion.

WORKS OF ROBERT CROWLEY.*

ROBERT CROWLEY belongs to a class of writers of whose works the Early English Text Society has already published a good many, and which we always accept thankfully on the strength of their value in themselves, while we at the same time slightly demur to their right to be put forth as specimens of Early English. Surely no straining of words can bring writings of the age of Edward the Sixth and Elizabeth under that head. A Scottish piece of that time may come in well enough, for the good speech of Bernicia might almost pass as Early English in our own times. But in these works of Crowley, whatever philological value they have is quite secondary to their value as throwing light on the times in which they were written. Robert Crowley is one of the prophets who denounce the evils of their own times. Such prophets always let us behind the scenes as to many things which went on in their times; but their pictures must always have something taken off from them. No age is quite so black as it is painted by those whose express business is to set forth its blackness. Yet the general consent of all contemporary writers as to the wretched state of England immediately after the changes in the middle of the sixteenth century is a fact which cannot be got over. Crowley bears no small part in that sad chorus, and he has found an interpreter of a kindred spirit in Mr. Cowper. He has edited other pieces of the sixteenth century which tell the same tale as Crowley's. And he has further taken up Crowley's parable on his own account. Mr. Cowper seems anxious to make us understand, not only that things were in a very bad way in the sixteenth century, but also that they have not greatly bettered themselves in the nineteenth.

Robert Crowley belonged to the younger generation of Reformers. The great events of the reign of Henry the Eighth were the events of his youth. The exact date of his birth is not known, but it seems to have been about 1518. He went to Oxford in 1534, and became Demy and Fellow of Magdalen, being chosen to the latter post in 1542. In 1549, the third year of Edward, he took to printing in London, largely printing his own works. In 1551 he was ordained by Ridley, and became a popular preacher. During Mary's reign he found shelter at Frankfort. After the accession of Elizabeth he held several livings and prebends in succession, chiefly in London and at Hereford, where for some while he held the dignity of archdeacon. But we find him sometimes resigning, sometimes deprived of, this or that preferment, and presently appointed to something else, in a way which is somewhat puzzling. We suspect that the key is to be found in the change of Primates. Crowley was a strong Puritan, and by no means to the taste of Archbishop Parker, and when he was vicar of St. Giles Cripplegate, he brought on himself the vengeance both of the Primate and of the Lord Mayor by raising a disturbance about a funeral in his church which was attended by clerks in surplices. And, as he further put forth opinions which the Archbishop looked on as anabaptistical, it is not wonderful if Parker, in his own phrase, "dulled his glory" by suspending, imprisoning, and finally depriving him. But opinions and doings which were sins in the eyes of Parker might almost pass for virtues in the eyes of Grindal; so it is not wonderful that at the very beginning of the new primacy Crowley got fresh preferment and was much employed as a preacher. But with Crowley's sayings and doings on strictly ecclesiastical matters we are not here greatly concerned, for the pieces which Mr. Cowper has here reprinted are none of them of a purely controversial kind, but are rather political and moral. We have here five pieces, three in verse and two in prose, all of them written and printed by Crowley during the three years when he followed his craft in London in the days of King Edward. In all of them the vices of the age, as Crowley understood them, are lashed without mercy. Crowley is a good citizen and a loyal subject, and preaches unlimited obedience to the law and to the King, but he denounces the evil doings of great men as well as small, and it is plain that his sympathies lie wholly with the lower classes of the people. No class is wholly let off; but the great sinners are the rich men of various kinds, the rent-raisers, the lease-mongers, the enclosers of commons, the simoniacal and pluralist clergy, the merchants who set up for gentlemen, the lawyers who defended causes which they knew to be unjust. In this last matter Crowley touches a very delicate

---

* *The Select Works of Robert Crowley, Printer, Archdeacon of Hereford, &c.* Edited, with Introduction, Notes, and Glossary, by J. M. [illegible] London: published for the Early English Text Society by Trübner & Co. 1872.

point, which has been disputed about over and over again; but Crowley at least draws a distinction between doubtful cases, where there is something to be said on both sides, and cases where the

[illegible] would walk therein aright. Laws were made to relieve the oppressed, and so forth; but, like other things, they have been corrupted by greediness. Here is Crowley's picture of the unrighteous "man of law":—

Doest thou then walke in thy callyng,
When, for to vexe the innocent,
Thou wilt stand at a barre ballyng
Wyth al the craft thou canst inuente?
I saye ballyng, for better name
To have it can not be worthye;
When lyke a beast, withoute al shame,
Thou wilt do wrong to get money.

Crowley, as we have said, was a strong Protestant and a strong Puritan, and had no sympathy at all for any relics of Popery which might have escaped the godly zeal of King Edward's Reformation. For abbeys, as abbeys, he could therefore have had no possible love, yet he mourns over their fall after his own fashion. There is nothing about which he is fonder of declaiming than about the alienation of the monastic lands, and especially of the tithes, to private uses, under which head he seems to reckon both their impropriation by laymen and their employment for the private ends of the beneficed clergy. So good a Protestant as Crowley would of course not altogether forbid the marriage of the clergy. Yet he seems to look on priests' wives as a dangerous class, who can claim at most bare toleration. He declaims against the practice of the clergy of all ranks—bishops, archdeacons, canons, and vicars—in "purchasing lands for their heirs," and marrying wives of whom he gives the following picture:—

Fingered ladies, whose womanlike behaviour and motherlike housewifry ought to be a lighte to al women that dwell aboute you, but is so fare otherwise, that, unlesse ye leave them landes to marye them wythall, no man wyll set a pinne by them when you be gone.

He then goes on:—

I woulde not your wives shoulde be taken from you, but I woll you shoulde kepe them to the furtheraunce of Goddes trueth, whereof ye professe to be teacheares. Let your wives therefore put of theire fine fruckes and Frenche hoods, and furnish themselves with al pointes of honest housewifery, and so let them be an helpe to youre study and not a lette. S. Paul teacheth you not to make them ladies or gentlewomen.

This is worth comparing with Lord Macaulay's famous description of the wives of the clergy in the next century; but it points to a rather different state of things. Unless indeed it be that, while Macaulay is speaking of the lower ranks of the clergy only, Crowley jumbles them all together, from the highest to the lowest, in one sweeping accusation.

Of the three pieces in verse, the first is a set of "one and thirtye epigrammes wherein are bryefly touched so many abuses as maye and ought to be put away." The number however is greater than is promised on the title-page, as the epigrams really number thirty-three. The epigrams are put alphabetically, according to their subjects; so he starts with abbeys, and goes on to ale-houses. He muses over the abbeys, and laments that their lands and jewels had not gone to relieve the poor, and to maintain godly preachers. Among the ale-houses he notes a difference between London and other places, for in London they are at least shut during the time of divine service, while

Lyghtly in the contrey
they be placed so,
That they stande in mens ways
when they shoulde to church go.
And then such as loue not
to hear their fautes tolde,
By the minister that readeth
the newe Testament and olde,
do turne into the ale-house
and let the church go;
Yea and men accompted wyse
and honeste do so.

Then there is one epigram which touches the suppression of hospitals in the time of Henry and Edward. A merchant who had been long in foreign parts came home and looked for a "spittle-house" that stood by his own dwelling, and a lordly building stood there instead. He took it for a sign of the growth of wealth in the country, but presently one of the expelled inmates begs alms of him and explains that they were all turned out,

And lye and dye in corners,
here and there aboute.

Rich men had bought the house and turned away their faces when the old owners craved of them. The merchant had been in Turkey, but never among heathen men had he seen such cruelty as this, and he was sure that God's vengeance would fall upon such wicked men. But, though Crowley is thus strong on behalf of the poor, he was quite aware of the tricks of the professional beggars of his time, of which he gives a ludicrous picture. He winds up however with a precept which would not please a political economist:—

Yet cease not to gyue to all,
wythoute anye regarde;
Thoughe the beggers be wicked,
thou shalte haue thy rewarde.

This [illegible] an epigram on bear-baiting, which we have somehow [illegible] by heart all our days, but had quite forgotten where it was to be found. It is perhaps not quite clear how far Crowley directly sympathized with the bear, but his notions of the matter were at any rate very different from those of the chronicler of the princely pleasures of Kenilworth; for, in the "terrible tearing" in which the prose writer saw a "sport very pleasant" and "a matter of goodly relief," Crowley saw "a full ouglye syght." But his chief thought was that the halfpennies that were given to the bearward ought to have been given to the poor. The wind-up is vigorous:—

If you give it, therefore,
to se a beare fyght,
Be ye sure Goddes curse
wyl upon you lyght.

For a bit of philology, by the way, we distinctly remember that, where we first saw this printed, Crowley's good genitive had got turned into "God his curse."

There are a good many illustrative stories scattered up and down these epigrams, and we certainly cannot think with Warton that they are lacking in "spirit and humour." The next piece is called "The Voice of the Last Trumpet," where Crowley takes upon himself the functions of the seventh angel of the Apocalypse, and calls before him twelve classes of people, each to receive admonitions according to his calling. Part of what he had to say to the lawyers we have already quoted. Here is a piece of advice to merchants in which one of the most cruel incidents of the feudal tenures comes in incidentally:—

Let it suffice the to mary
Thy daughter to one of thy trade:
Why shouldest thou make hir a lady,
Or bye for her a noble warde?
And let thy sonnes every chone
Be bounde prentice yeres nine or ten,
To learn some art to lyve upon:
For why should they be gentlemen?

"Every chone" is one of those forms which come in when the real origin of words is forgotten. "Every" is "mfer elc," "ever ilk," "ever each"; but the softened *ch* has moved from the end of one word to the beginning of the next. It is something like the very local West-country form "cham" for "I am," that is, *ic* softened, Saxon-fashion, into *itch*, whence the *ch* has moved away to the beginning of the verb.

Then comes the third metrical piece, called "Pleasure and Payne, Heaven and Hell: Remembre these foure, and all shall be well." It is evidently meant to be a Protestant substitute for those musings on the next world of which the mediæval religious poets were so fond. Crowley of course has nothing to say to Purgatory, nor does he indulge in any minute physical descriptions of heaven and hell; but he dramatizes the familiar painted scene of the Last Judgment, and he calls up various classes of offenders, those particular classes of offenders of his own time, of whom we have already spoken, to receive their sentence. The rent-raisers and the lease-mongers and the pluralists and the simoniacal patrons and the swallowers-up of tithes, all come in for their share. Here is a specimen of Crowley in his more solemn style:—

Let the pore man haue and enjoye
The house he hat by copyeholde,
For hym, his wyfe and lacke hys boye,
To kepe them from hunger and colde;
And though the lease thereof be solde,
Bye it agayne though it be dere,
For nowe we go on oure laste yere.

Caste downe the hedges and strong mowndes,
That you haue caused to be made
About the waste and tyllage grownde,
Makeynge them wepe that erste were glad:
Leste you your selfes be stryken sadde,
When you shall se that Christe doeth drye
All teares from the oppressedis eye.

In this last line we get a good genitive in a place where we should least of all have looked for it.

The other two pieces are in prose, and to our mind Robert Crowley writes very stately and dignified prose, perhaps slightly stiff, but not remarkably Latinized, and with very little of what we commonly call quaintness; but then, according to Mr. Earle, it is in the seventeenth century, rather than in the sixteenth, that quaintness is properly at home. No style, for instance, can be more opposite to the style of Robert Crowley than the very perfection of quaintness, the style of Bishop Godwin. The first of the two prose pieces, from which we have already given an extract about the priests' wives, is called "The Way to Wealth, wherein is plainly taught a most present remedy for Sedicion." Here Crowley takes up his parable against the same classes of people against whom he speaks in his poems. He denounces the oppressors; at the same time he preaches passive obedience to the oppressed; they are to stay quiet and God will deliver them sooner or later. The poor men themselves however were, as the history of the insurrection in Norfolk and Cornwall shows, of another mind. Crowley dramatically brings in one of them pleading his own cause, and saying, "no remedye therfore, we must nedes fight it out, or else be brought to the lyke slauery that the French men are in." The last piece takes up very much the same line, in the form of a petition to Parliament:—

An informacion and Peticion agaynst the oppressours of the pore Commons of this Realme, compiled and Imprinted for this onely purpose that amongest them that haue to doe in the Parliamente, some godlye myuded men may hereat take occacion to speake more in the matter then the Authoure was able to write.

Several other writings of Crowley, many of them, it would seem, of a more controversial kind, are spoken of by Warton, and it

must not be forgotten that he was the first to print the Vision of Piers Plowman, for which we need be not the less thankful to him because it was rather with a polemical than a philological or historical purpose that he printed it.

BAGEHOT'S PHYSICS AND POLITICS.*

WE need not inform our readers that Mr. Bagehot writes in a graceful style, and has much to say upon political topics that is well worth their attention. The little book before us, the chief part of which, if we are not mistaken, has already appeared in the *Fortnightly Review*, will be read with interest, though perhaps it is scarcely equal to his comment on the British Constitution. It may be described as an attempt to apply scientific reasoning to political theory, and is included in the catalogue of the "International Scientific Series." We must say, however, that it is only by using the term "science" in an extremely loose fashion that it can be brought under that head. Mr. Bagehot himself would be the last person to describe it as a statement of recognized principles; and, indeed, fond as people are of using big words in such a connexion, any phrase which couples science and politics must be considered premature. Mr. Bagehot, however, tries to indicate in what manner various scientific theories, and especially those of Mr. Darwin and Mr. Herbert Spencer, may be applied to political speculations. The question is itself interesting, and, in the hands of a very able writer, its treatment leads to a number of remarks well worthy of observation, if not sufficiently systematic or well-established to be dignified with the name of science. Within our limits it is impossible to dwell upon these scattered sayings, and equally impossible to give anything like a full discussion of Mr. Bagehot's general theory. We will endeavour briefly to show at what point his doctrines appear to us to require modification or further development.

The general theory is summed up in his last chapter. As Mr. Bagehot points out, in confirmation of a valuable remark of Sir Henry Maine, we are apt to regard progress—whatever progress may mean—as a universal law of human nature; whilst yet nothing can be plainer than that a very large majority of mankind is and has been stationary. Hence it would be of the highest possible interest to discover what are the necessary conditions of progress. Looking back upon our savage progenitors, and tracing the various developments of the great races of the world, Mr. Bagehot perceives (we state his doctrine in our own language, and apologize if we involuntarily misinterpret him) that there are two general principles which form nations or races, as they have, on the Darwinian theory, formed species of animals and plants. There is the principle of hereditary resemblance, which makes us like our ancestors, and there is the principle of variability, which works through natural selection to cause gradual modifications of type. Now in the earlier ages of mankind, when every tribe had to fight for its existence, the condition of primary importance was the creation of certain fixed customs. A nation could not co-operate unless bound closely together by the iron hoops of custom; and those nations which had the best customs gradually predominated over their competitors. Unluckily the result of this tendency was that many customs became stereotyped, and the nations in which they prevailed passed into a stationary state. Those which preserved a certain flexibility then had the best chance of further development. The expression of this power was the advent of an "age of discussion." Following out some of the lines of thought suggested by Mr. Mill's *Liberty*, and adding some suggestions of his own, Mr. Bagehot insists on the vast importance of this element in a civilized nation, and concludes (it is not a very original conclusion) that "liberty is the strengthening and developing power—the light and heat of political nature." A doctrine upon which he lays much stress is the vast importance of what he calls in italics "*animated moderation*"—or, in rougher language, the need that nations, like men, should have "plenty of go," and yet "know when to pull up."

In a rough statement, this is the substance of a good deal of Mr. Bagehot's writing; and the first thought that occurs to us is that if we strip it of its scientific dress it comes to little more than a familiar platitude. All improvement implies a union of order and progress. Both are essential at every stage of natural development. Order can only be obtained amongst savages by brute force; and therefore, at very early periods, such an institution as slavery, which soon becomes mischievous in the highest degree, may be really useful. It is a necessary step towards division of labour and the development of a class with leisure for intellectual improvement. As men grow more intelligent, it becomes possible to secure order by appealing more to men's reason and less to their fears. Arbitrary force is mischievous as soon as it is superfluous; and what Mr. Bagehot calls an age of discussion may then be originated. All this is substantially true; but we can hardly call it new, or even admit that the scientific basis on which it is placed does very much to strengthen our confidence in the results. However, it is well to restate old doctrines in terms adapted to the age, and we welcome the new light which Mr. Bagehot has so far thrown upon the subject.

We have, however, a certain objection to his theory, or perhaps we should rather say that we are conscious of a gap which requires to be filled up. It is often objected to Mr. Darwin's theories that they do not give a law in the full sense of the word, but merely state a condition of progress. A beast of prey, he says, develops claws, because the rudimentary claw which occurs in some individual is useful in the struggle for existence. That explains the process by which claws, when once started, came into general use; but it does not attempt to explain the first appearance of the claw. To say that accident produced claws is merely to say in a roundabout fashion that we do not know how they were produced. In other words, there are laws of whose operation we are left in complete ignorance. This does not, of course, imply that Mr. Darwin's theories are not of the highest value, if well founded; but it illustrates the limits within which they are necessarily confined. Now Mr. Bagehot's theories involve the same difficulty, which frequently makes his doctrines look like a mere verbal explanation.

We take his own account of this difficulty in a particular case. The problem being, "Why do men progress?" the answer is, that they have a certain amount of "variability." This sounds, as he remarks, like the old explanation by occult qualities. It is like saying that opium sends men to sleep because it has a soporific quality. No, replies Mr. Bagehot, the explanation is more than verbal. It states that men make progress when the fixity of custom has been developed up to a certain point, and not developed beyond it. "The point of the solution is not the invention of an imaginary agency, but an assignment of comparative magnitude to two known agencies." Let us, however, look a little closer. To say that progress involves variability is saying nothing more than that, in order to change, men must be capable of changing. There is perhaps a little more in the further statement that men must have fixed customs. This is true; and is perhaps not quite self-evident. The addition that, if they are to improve, the customs must not be too fixed, is, as before, mere tautology; and therefore Mr. Bagehot's statement scarcely seems to come to any more than this, that a certain fixity of custom is desirable. Surely that is a proposition which nobody would ever think of denying, whether he was or was not a Darwinian. A really valuable remark would be made if Mr. Bagehot were capable of giving us any sort of rule as to the degree in which customs should be fixed. But this is obviously beyond his power or that of any man. When he tells us that fixity is more desirable at an early than at a later age, he is really making a statement which may be discussed with interest, and which, whether sound or otherwise, has a certain historical value. We have already explained our view of its meaning. But the bare assertion that variability is a condition of improvement seems to us to be no more than verbal, in spite of Mr. Bagehot's efforts to make something of it.

Although we cannot profess to be much struck by this part of the theory, we fully admit that Mr. Bagehot incidentally makes many valuable remarks on the way in which changes are actually brought about. He is too apt, indeed, to mistake a confession of ignorance for a statement of positive knowledge, but his remarks are often ingenious. Thus, for example, he attributes great importance to the process of what he calls unconscious imitation. He says—and the remark is true and curious—that "every one who has written in more than one newspaper knows how invariably his style catches the tone of each paper while he is writing for it, and changes to the tone of another when he begins to write for that." He explains in this way the origin of different schools of literature, and extends the remark to national character. Steele, for example, to use his illustration, struck out the notion of essay-writing. Addison took it up and perfected the art. The public taste was impressed, and a whole group of inferior writers was infected by the same style; and thus we account for the change between the days of Shakspeare and Bacon and those of Pope and Locke. The New England type of character has, he thinks, been developed after the same way by the attraction exercised by the first Puritan emigrants. Now it is plain that this is no explanation at all of the first cause of the phenomenon. Why did Steele take to writing essays, and why did they strike the public taste? It does not account for the cholera to say that A. caught it from B., and B. from C., and so on to the end of the alphabet. Why, we must ask, did Z. catch it? and, moreover, what were the conditions that made it catching? These are the real problems, and an answer to them would lead to valuable results—such, for example, as the importance of drainage. The answer given by Mr. Bagehot tends to distract attention from the real difficulty. If Steele had died in his infancy, would not the same literary type have been produced by somebody else? Were there not hundreds of men partaking of the same general sources of inspiration, and labouring to find a convenient mode of expressing themselves? A philosophical observer would inquire into the contemporary state of theology and philosophy, the social conditions, the influence of foreign countries, and a hundred other causes of a general character; and, so far as he allowed himself to be put off with Mr. Bagehot's answer, he would be tempted to believe that a profound change in national modes of thought and expression was simply accidental; and perhaps, very unphilosophically, to call accident a cause. Mr. Bagehot's remarks are useful as illustrating the method in which a change, once begun, is propagated; but they are obviously irrelevant in considering the determining causes of the change. We do not imagine that he would dispute this; but he seems scarcely to give sufficient prominence to the profounder movements of thought, because his whole attention is devoted to the [illegible] apparatus.

---

* *Physics and Politics.* By Walter Bagehot. London: King & Co. 1872.

The same theory occurs, in connexion with a more distinct logical error, in another part of his book. Mr. Bagehot attributes great importance to the savage belief in lucky omens, and he explains their occurrence in this way. An expedition, he says, fails when a magpie crosses its path, and a magpie is then supposed to be unlucky. Surely this is an inversion of the real process; and an inversion which again leads him to attribute exaggerated importance to mere chance. The case may be illustrated from his own anecdotes. Somebody told Scott to cure a disease by sleeping for a night on twelve smooth stones collected from twelve brooks. Does Mr. Bagehot suppose that this superstition originated in the accident that somebody had slept on twelve stones collected from twelve brooks, and been cured accordingly? How did anybody come to think of collecting the stones and sleeping upon them? Could such an accident possibly occur? Obviously the superstition originated in a deductive, and not an inductive, process. It was not the result of experiment, but an *à priori* theory derived from some notions as to the magic influence of the number twelve, and of stones in brooks. Perhaps Scott's adviser had read Shakspeare, and fancied, like a good Presbyterian, that objects which included sermons must have a mysterious virtue; or he had a shadowy recollection of the stones set up in Jordan; or some other fanciful association of ideas may have been derived from fifty other causes. But surely nothing can be plainer than that the association preceded the experiment, and indeed was the only reason for making an experiment of so arbitrary a character. The confusion of ideas depends upon the well-known law of the incapacity of an uncultivated mind to distinguish between objective and subjective impressions. Mr. Bagehot when he was a boy used to play loo; and his childish companions found that a particular "fish" which was prettier than the others brought luck with it. Why? Not because a boy who had that fish had won on a particular occasion, but because the pleasure of having a pretty fish was naturally associated with the pleasure of winning the game. The boys thought, like Mr. Bagehot, that a mysterious power called "luck" had a good deal to do in the world, and that when it meant to favour a boy, it would give him a pretty fish as well as a good set of cards. Similarly, for some reason not now traceable, savages disliked magpies; perhaps they are bad to eat, or their cry suggests alarm; and the unpleasant sensation produced by the flight of the bird suggested the unpleasant sensation of being defeated, which again, they fancied, might precede as well as follow the actual occurrence of a defeat. Why indeed should they attend to magpies more than to a hundred other phenomena, except that they already had some associations with it? The same thing is proved, if it needed proof, by the universality of certain superstitions. All rude nations are frightened by eclipses, and therefore all rude nations suppose eclipses to portend disaster. If they had argued on the matter, they would have necessarily found as many eclipses preceding victories as preceding defeats; and therefore their views of the meaning of an eclipse would probably have been equally divided. Mr. Bagehot imagines that some "Nestor of a savage tribe" remarked a coincidence, and that his authority gave popularity to the superstition founded upon it. Therefore he infers that "luck" played a great part in the world. The true process we take to be entirely different. Some obvious associations of ideas are suggested to all savage tribes, and give birth to superstitions which bind the "Nestor" as well as his fellows. And the examination of this process leads to the discovery of a curious mental law, which is left unnoticed if we accept Mr. Bagehot's crude explanation.

In spite of these errors, as they seem to us, which lower our estimate of the value of Mr. Bagehot's book, the line of his inquiries suggests to him many interesting remarks the value of which is not diminished by the questionable nature of some of his theories; and on the whole we can recommend the book as well deserving to be read by thoughtful students of politics.

THE ROMANCE OF HISTORY.*

THE five octavo volumes which bear this title are made as attractive outwardly as red cloth and gold letters can make them, and each volume bears on the back and side the arms of the country from the history of which the tales it contains are supposed to have been taken. These tales have already made their appearance in some other shape, and have, if we may believe the introductory prefaces, been so well received that the present publishers consider "that they will add to the literary pleasure of another generation by reproducing them in a compact form." They are moreover embellished with numerous illustrations somewhat of the old-fashioned sort, which know no mean between the utter imbecility of countenance supposed to be inseparable from loveliness and virtue and the painful deformities and hideous glare ascribed to all unpleasant characters, from harmless maniacs to villains of the deepest dye. Good and bad alike, too, make impossible contortions and writhings of body and limbs without for a moment losing their placid smile. But, although so much trouble has been taken to contribute to the pleasure of the readers of these volumes, their profit has not altogether been lost sight of. Certain pages of closer print with dates at the beginning of each paragraph, have been put in between the "Tales," under the name of "Historical Summaries." We suspect that these summaries will share the fate of the hymns and prayers with which certain goody stories are interleaved, and which are generally left unread by the children for whose improvement they are intended. We hope it may be so; for, not content with the usual vulgar errors, the summaries seem to have hit on some new blunders quite peculiar to themselves. But in addition to these "Historical Summaries" we are told that, "where modern historical research has shown that the Fiction varies too palpably from the Fact, notes have been added." Eager to profit by the labours of modern historians, we turn at once to the first of these notes in the volume on England. We there find that our modern historian is none other than Giraldus Cambrensis, and all he has to tell us is the old story of Harold's escape from the field of Senlac and after-life as an "anchoret" in a cell attached to St. John's at Chester. If the editor will take the trouble to turn to the pages of Mr. Freeman's History, he will find this legend given there for what it is worth, and its true meaning and value pointed out. After having learned this, we think he would do well to write yet another note, and this time to add it to the *fact*, not to the *fiction*.

It would be hard to say for whom these tales are intended. Not for children surely. The love-making that forms the chief feature in one and all of them is far too decided to allow of their entrance into any well-regulated nursery or school-room. But for that they might find favour in the eyes of the little folk who delight chiefly in stories about cruel kings and lovely princesses, but we scarcely think their absurdities will be swallowed by the elder brothers and sisters who have attained to the dignity of full-grown novels. Historical, or would-be historical, tales must however be popular with some class of readers, or we should not be so overrun with them. We believe that there are certain persons whose minds are so constituted that they cannot feel an interest in any historical characters unless they are told the colour of their eyes and hair, and who look with contempt upon any manuals that do not satisfy their curiosity on these important points. To all such persons we without hesitation recommend these "Tales." Not a leaf can you turn but some notable personage with whose name you are already familiar is introduced to you with keen blue eyes or large black ones, jetty ringlets, auburn tresses, or locks blanched with age, just as it suits the writer's fancy. But whatever they may be to readers, we do not at all wonder that the historical tale should be a favourite style with writers of fiction. They consider themselves at liberty to play all sorts of queer tricks with the doings and fame of the worthies whom they thus draw out of their sepulchres. They are unfettered by the necessity of giving to their plots that minimum amount of probability exacted in the modern novel, or of making their puppets speak a language in some degree akin to the talk of rational human beings, and in general the tales are short enough to avoid the risk of changing the complexion of the chief actors more than once, at all events, before the end. All that the writer of an historical tale has to do is to choose a certain number of names from the first history that comes to hand, to ascribe to these names a picturesque mixture of stalwart frames, graceful forms, waving ringlets, and flowing beards, to make them call their equals "master" instead of "mister," their superiors "my liege," and their inferiors "minion" or "varlet." Furthermore, he must put into the mouths of these creatures of his fancy certain stock words and phrases, such as "durance" for imprisonment, "malison of heaven" for a pretty strong dose of abuse, and he must scatter such expressions as "by our Lady," "Heaven forefend," "Good sooth," "Peace, minion," "Mark me, my masters," "Marry, my lords," "Ha, hail!" "tush" or "methinks," broadcast over the pages. He must make all things subordinate to the fortunes of some young man and young woman to be styled alternately "fair damsel" or "wench," "springald" or "comely youth," according to the friendly or hostile feelings of the supposed speaker. Let him then wind up with either a wedding or a murder, according to the state of his own temper, and he will have turned out a very tidy tale with very little trouble to himself.

The first of the tales in the English series comes up pretty fairly to these requirements. It is called "Wulfstan of Worcester," and may serve as a specimen of the miserable nonsense which is here palmed off under the guise of history. As was to be looked for, all the characters are either Normans or Saxons; but our hopes of making the personal acquaintance of a real live specimen of that wondrous being the "semi-Saxon" are this time disappointed. The legend of the English Bishop's appeal to the dead Confessor, and of the miracle wrought at his tomb, goes a long way towards filling up, and the inevitable pair of lovers are united in a somewhat irregular and sudden fashion in presence of the Council held in the West Minster. This interesting pair are of course a Norman and a Saxon; but by way of giving zest to the tale, the bride, a lovely creature, who has seen some eighteen summers (what do heroines do with themselves in winter?), is none other than the daughter of the "Reverend Prelate." Against such a scandal we must protest. It is bad enough to make the saintly Wulfstan break forth into profane swearing; but to give him a fair daughter, who "gazes from the windows of her father's palace at the "spires and columns of the cathedral," and "the majestic summits of Malvern," is downright defamation of character. In those days a wife and daughters were not looked on as the indispensable tenants of every episcopal palace. We do not mean to assert that bishops with such incumbrances were entirely unknown; but they were few and far between, and only such as had been married before entering the priesthood. Not of these was Wulfstan of Worcester, the Saint who in early youth became first a priest and then a

* *The Romance of History.* London: Warne & Co. New York: Scribner, Welford, & Armstrong.

monk, in that city where as prior, and afterwards as bishop, he led that life of purity and virtue which places him as the best and holiest of the churchmen of his time; the man who by his wisdom won the favour of princes, and by his eloquence induced the money-loving merchants of the great commercial city of the West to renounce the unlawful trade by which they had their gain; the priest who ceased not to raise his voice against the laxity and self-indulgence of his married brethren. For a better understanding of his life and conversation we recommend Mr. Neele to study carefully the authority to whom we have already referred. And we would in all brotherly love counsel the weavers of those tissues of fable commonly called historical tales, if they must sport with the characters of "Reverend Prelates," to pitch upon some one whose life and virtues have not been so minutely chronicled as those of Wulfstan, the saintly Bishop of Worcester.

The Historical Summaries in the French series are longer and fuller than those on England. The writer, Mr. Ritchie, has free scope for airing his own views on religion, politics, and philology, and he really becomes entertaining. He brings us into a very wonderland of monsters and hobgoblins, the slayers of whom deserve to share the renown of the giant-killer of nursery legend. His pet bogie is clearly the state of affairs which he is pleased to call feudality. It haunts him in every page, and against it he wages ceaseless and deadly war from its cradle to its grave. On the second page the birth of this monster is chronicled in a list of other important events, though unfortunately the day of the month and year seem to have been lost. A little further on it takes a human form. Hugh Capet, we are told, was the "personification of feudality." By and by it turns to stone, for in the eleventh century "the keystone was placed of the great arch of feudality which bestrode the kingdom from one end to the other." Not such a great stride, after all, in those days, when but a small pièce of Gaul went to the making of the kingdom. But before another hundred years have gone by the arch springs to life again, and becomes a hobgoblin, and his stride has stretched still wider, and now takes in the whole Continent. But the end draws near. We read how "Philip Augustus struck a successful blow at feudality, that terrible hobgoblin which bestrode Europe." This hobgoblin, however, was by his excesses cutting his own throat, and therefore we are not surprised to find meted out to him the punishment which the great poet of the Shades would have us believe is the award of suicides. He is transformed yet once again, into a tree, and before long it is all over with him. By the seventeenth century "the whole pith and sap of the many-branched *regime* of feudality had long since gone to strengthen the central trunk of absolutism."

The career of the Church may rival the wondrous course of "feudality." In very early days we learn that "Priestcraft waxing to a Colossus soon encompassed in its fatal stride all Europe." After such a stretch we are not at all surprised to hear of "the power of the Church advancing with gigantic pace." We only wonder, in all simplicity, how much further the next step would take it, and how it came that it did not at once step across the ocean, and light on the New World on the other side. Prepared however as our minds have been by all these marvels, still when we read that "the Pope re-bellowed another bull," it fairly takes our breath away. With the accomplishment of speaking pearls, diamonds, or frogs, all readers of fairy tales are familiar, but the power of "bellowing a bull" casts these fairy gifts quite into the shade. After all these wonderful statements we are not surprised to find that Mr. Ritchie feels a special aversion to critics, and reckons among the misdeeds of Charles the Ninth that he "patronized authors and critics." He has indeed a happy knack of saying something instructive about all the kings. He tells us that Francis the First was "a very gentlemanly king, which was so far well, as France had by this time become an absolute monarchy." Sometimes, too, a prophetic gleam lights up the gloomy annals of wars and fighting, or we are taken behind the scenes and let into the secrets that set the springs of history in motion. Thus we are told that "William Duke of Normandy conquered England and established a despotism as general as feudality permitted. William was fat; and the King of France unfortunately joked upon this circumstance. This occasioned a war which may be said to have continued with some *truces of God* till the battle of Waterloo." We hope that this warning as to the folly and wickedness of making personal remarks will be taken by all young readers.

Having seen what the facts in this volume are, we shall not expect better things from the fictions. It begins with the old story of how Bertha (should it not be Emma?), the daughter of Charles the Great, carried her lover Eginhard across the snow to avoid the risk of tell-tale footsteps. Of course it is but a small thing to speak of her as a "daughter of the House of France," to put French songs into her mouth and to frenchify Aachen into Aix-la-Chapelle; but it is something new to meet the Great Karl coming through a wood singing a song which "seemed to be one of the war hymns of the Celts popularly known in France since their collection a few years before by the King." We should be glad to know whether these hymns were sung by the Celts before they began to speak Latin, or during the time when the popular songs were like the common talk in the tongue of the Roman people. All through this tale, "The Court of Charlemagne," Mr. Ritchie seems to imply that French was the language of the Frankish Court. Yet he knows better, or, at all events, before the end of the volume he has learnt better, for in the summary to the twelfth century we learn:—

> The Latin and Tudesque tongues—the latter a dialect of Germany—were now fully molten into what is called the Roman, or Romance; which, polished by nearly seven centuries, is the French language of our day.

Badly expressed as this is, one can at least see what it means; and the meaning is true so far as it goes, and shows that Mr. Ritchie knows perfectly well what a modern mixture French is. But the tit-bit in this tale is kept for the last, when Constantine, the son of the Eastern, or, as they considered themselves, sole Emperors of Rome, sends to the rival who has cut him out in the favour of Bertha a sword whereon was inscribed

> To the most illustrious the Prince Angilbert, from his friend *Constantine of Greece*.

This inscription, we are told, astonished every one, and we are not at all surprised at that. Would that it had been preserved, that it might astonish us too! It would have been a very fitting companion for that other interesting relic, the "Sword that Balaam wished for."

But the wonders we have found in France have tempted us to overstep our limits, and we have but a few lines to spare for the rest of the series; to wit—Spain, by Don T. de Trueba; India, by the Rev. Hobart Caunter; and Italy, by C. Macfarlane. As for Spain, as it is only in the sixteenth century that it appears as a power in Europe, the general run of readers know even less about the history of the several States that go to form the modern kingdom than they do of other countries, and romancists may give their fancy a very loose rein without fear of being pulled up short for inaccuracy. We must, however, protest against calling Joanna the *Queen Dowager*, after the accession of her son Charles the First, as her reign continued in name at least until her death.

Italy has come off best in the series. The manner in which the tales are told is much better, and the matter of which they are made up is less improbable than in the other volumes. But we cannot help noticing a blunder, perhaps the most generally accepted of all the many blunders which pass current with unthinking people; to wit, that the last year of one century is the first of the next. Mr. Macfarlane begins his summary of the fifteenth century with the year 1400, and though by so doing he is only following the example of Sismondi, of Villani, and of Boniface the Eighth, too, for that matter, who proclaimed a Jubilee for the end of the century in 1300, it is still distinctly wrong. Would Mr. Macfarlane be content if a debtor who owed him 100*l.* paid him 99*l.*? If not, why should he defraud the fourteenth century of its last year, and put down the doings of that year 1400 to the account of the already almost too eventful fifteenth century?

COLONEL HAMLEY ON THE FRANCO-GERMAN WAR.*

If some one could have told Colonel Hamley, when his now well-known work appeared seven years since, that within this short space of time it would twice become his duty to rewrite large portions of it in order to convey to the readers of new editions fresh teachings as important as any he had gathered from all former history, we doubt if even his prescience would have admitted the possibility. Yet so it actually has proved. Scarcely had the world made acquaintance with the book as originally penned, when the war of 1866 came to upset all past experiences, and to prove that a veteran leader, supported by veteran officers, and fully confident of victory, might be beaten and crushed at every point by inexperienced generals at the head of what had hitherto been regarded as a mere peace army, but which was carefully trained and carried a better weapon. So brief was the collision of 1866, and so sudden the Austrian defeat, that it was difficult to gather its full lessons aright. The Prussians themselves had not completely learnt them, although guided by the almost prophetic spirit of Captain May, when their late trial came upon them. As much however as was to be told Colonel Hamley collected in his second edition, noticed by us on its appearance (*Saturday Review*, July 31, 1869). What 1866 left incomplete 1870 has finished. What was subject for discussion three years since is now matter of historical evidence and deliberate judgment. Vast changes, all admit, have come about. But how far the greater principles of strategy must be modified in accordance with the increased size of armies and the progress of the steam-engine and telegraph; what are the limits to the revolution which rifled field-guns and breechloading small-arms have palpably forced upon us in tactics—these are questions with which a really standard work, such as that before us, must deal, under penalty of being held antiquated if they are passed over. We are not surprised to find that Colonel Hamley gives two complete chapters to the results of the late war, and to these we propose to confine our attention.

The circle of readers which Colonel Hamley addresses, as he points out in his preface, is widening from year to year as military education improves. Whether it be, as he suggests, that the details of the late great wars have shown the vastly increased importance of professional knowledge, or whatever may be the special cause, the fact is certain. Any one who recalls the ignorance of the public as to the events of 1859, when a true conception of even the broader part of the strategy was altogether exceptional, and contrasts the state of things then with that two years since, when every educated man who had leisure followed the movements from day to day, will realize how great is the change among ourselves. Objects purely professional, as Colonel Hamley remarks, excite among ourselves an interest which extends far beyond the army. Meanwhile, over

* *The Operations of War.* By Colonel E. B. Hamley, R.A., C.B. Third Edition. London: William Blackwood & Sons.

the greatest of our neighbours there has passed a change of a far more serious kind. The turning of the whole Prussian nation into a great school of war Colonel Hamley regards as the most remarkable of many proofs of the unwonted attention paid by this generation to military science. We differ from him here, believing it rather the prime cause of the feverish activity of other countries than a mere part of a blind general movement of the time. Be this as it may, the present age has lived to see "in Prussia a nation devoted to the requirements of the army, and an army devoted to the requirements of war"—a spectacle the world has never known before since the era of Roman conquest, except for a brief space under the First Napoleon. The fact is there, whatever be the criticisms on it; and those who live in the age have no business to leave it out of their reckoning. It is a sense of this movement, no doubt, and a consciousness that it adds to the appreciation of his work, which makes Colonel Hamley launch his new edition in full confidence that its lessons will go far beyond the profession directly addressed.

A brief but very pregnant chapter of the new edition is devoted to Changes in Contemporary Tactics. Those who are acquainted with the published Wellington Essays, and remember that Colonel Hamley selected them, will be prepared to find how completely his mind, despite a natural conservatism, has accepted the teachings of the late campaign as to the rejection of old formations for the attack. Theory and traditions, as he clearly points out, gave way in 1870 under the pressure of facts. The attack at once came to consist of, instead of being merely covered by, skirmishers. And the Prussians being, by their superior training, far better prepared for the new conditions than the French, the advantage fell naturally to their side. But Colonel Hamley is not content with merely going over the ground to see what has been done. He seeks to pierce the future of war, and, after fully elaborating his account of the present Prussian system, he points out how largely it is influenced by their unbroken success, and intimates that their confiding in cavalry because cavalry have done so much for them, and in offensive tactics because these in France have so constantly brought victory, are circumstances which may possibly be turned against them hereafter. It is not to be expected, he declares, that any army will ever be better fitted for fighting than theirs is now. Success, therefore, must be sought mainly in anticipating and preparing to meet the peculiarities of its warfare in its latest developments. His ideal defence of a country against the Germans is so important that it should be given in his own words unabridged:—

> An antagonist may calculate on finding all their movements at first characterized by audacity, and should seek them his advantage. He should meet their reconnoitring cavalry with a well maintained cordon of mounted riflemen. Knowing that their advanced guards will be eager to engage, he should draw them into attacks on his own, bringing up a force of mounted rifle men to turn the scale against the infantry, and of cavalry to attack the great battery which will be presently seeking to overwhelm him. Except with manifest advantages on his side, he should not at first imitate their tactics by seeking to engage, but await them in position, *combining his defence with the offensive action of a detached force* [the italics are our own] which would manœuvre for the occasion on a pivot of its own, but which would receive its impulses from the general-in-chief by means of the telegraph. Should the enemy seek to turn his position by a circuit, he may throw himself across the heads of their columns, confident of finding that their eagerness to engage will have caused them to extend unduly, and that he will be met at the successive stages of his attack by numbers constantly inferior to his own. If the intercepting movement be completed before he can meet it, he may strike boldly at their rear with the certainty of finding there a vulnerable point. When about to become the assailant, he should manœuvre to base himself anew and threaten their communications; for though this may have been foreseen by them, yet the sudden change must derange their plans and complicate their movements. Other operations in a similar spirit will suggest themselves to the reader; and, throughout the campaign, advantage should be taken of the railways, telegraphs, and temporary bases available for an army in its own country, to combine simultaneous operations, on varying fronts, for a common purpose of defence or attack. And though it is not to be doubted that tacticians as sagacious as those of Prussia must have foreseen how their own tactics may be met, yet it is by no means certain that the alternative system they may devise will be so successful as that which destroyed the armies of France.

The idea we have italicised of combining the defence of a position with a moveable force outside, is plainly a favourite one with Colonel Hamley, and he applies it admirably elsewhere to a concrete example, by supposing that Bazaine on August 18 had thus detached part of the reserves—of which he actually made no use—in the direction of Thionville, so as to retain the power of bringing them to bear suddenly on the rear of the Guards and Saxons in their attack on his right flank. Bazaine, we know, was occupied entirely with his other flank, and indeed was in every way singularly unequal to the occasion. But the comment made on this and similar tactical opportunities is very just, that "there have been as yet few or no examples of the facilities for new combinations which science has conferred on war."

Colonel Hamley goes much further than this reflection. He declares of the battles of 1870 that the student will learn nothing from them of the higher tactics which make skill supply the place of greater force, or effect great results with small loss. We believe that in the main he is right, and he is certainly so when he asserts that such tactics are quite as desirable now as under former conditions. It will be seen that at this point he breaks off entirely from such writers, for instance, as Boguslawski, who treat what happened at Woerth, Gravelotte, and Sedan as the inevitable form of future war, and almost demand a superiority of numbers in order to ensure victory. To us it has always seemed that their assumptions are somewhat hasty. It must be against all human experience that genius should suffer in power by having better materials to work with than before. And we strongly recommend, therefore, to those who have believed the subject to be exhausted and the question decided, a careful study of Colonel Hamley's chapter on Contemporary Tactics.

Hardly less deserving of attention is that on the Campaign of Metz and Sedan which will be found in another portion of the new edition. Dry this is of necessity in form, being rather a key than an independent narrative; but special interest attaches to the writer's comments at the end, and above all to his treatment of the supposed case of Bazaine's escape. Had this been attempted at once, when the French found themselves headed off at Mars-la-Tour, by a sudden movement through Metz, and a march beyond it south-eastward, Colonel Hamley shows with masterly clearness that there was nothing to prevent its immediate success. The French would soon have got into an untouched district. They would have destroyed with ease the German communications; and, by marching on Strasburg and raising the siege, they would have imparted a victorious aspect to the movement. German writers will not admit that their generals would have been, as Colonel Hamley believes, "much more solicitous to restore their communications than to follow Bazaine"; but no one can doubt that if the movement had succeeded even partially, the whole aspect of the first part of the war would have been changed. As a general reflection on the strategy of the campaign, Colonel Hamley has undisputed truth on his side when he points out that the predominance of the German armies, manifest from the outset, deprives it of much of its value as a study. This chapter is closed by what most readers will give the author their particular thanks for. This is a brief but thorough examination of the new frontier line of France, which, as is shown, is still capable of being made strong against new German invasion, but only at a large fresh outlay for defensive works. The resources of France seem almost unlimited, but, adding this need to her other present military requirements, it is quite clear that she has a very long time to look forward before she can hope to meet her late conquerors on anything like terms of equality.

DAVIES'S HESIOD AND THEOGNIS.*

THIS excellent little work belongs to the series of *Ancient Classics for English Readers*, edited by the Rev. W. Lucas Collins. If all the other works of this series are written with the same ability as *Hesiod and Theognis*, a very valuable addition, in an unpretending form, will have been made to the literature of the country. Perhaps, however, it is too much to expect that the editor can be in every case fortunate enough to secure the services of a writer who, like Mr. Davies, unites to a scholarly knowledge of Greek a no less scholarly knowledge of English. It has of late been made only too clear that men may be distinguished as teachers of the classics, and set among the highest in the ranks of schoolmasters, and yet may be unable to write their own language with any degree of accuracy. From some other books of this same series which have already been brought before our notice, we feel very hopeful, however, that in the present case the work throughout will be well done. It is difficult to estimate too highly the value of such a series as this in giving "English readers" an insight, exact as far as it goes, into those olden times which are so remote and yet to many of us so close. It is in nowise to be looked upon as a rival to the translations which have at no time been brought forth in greater abundance or in greater excellence than in our own day. On the contrary, we should hope that these little volumes would be in many cases but a kind of stepping-stone to the larger works, and would lead many who otherwise would have remained in ignorance of them to turn to the versions of Conington, Worsley, Derby, or Lytton. In any case a reader would come with far greater knowledge, and therefore with far greater enjoyment, to the complete translation who had first had the ground broken for him by one of these volumes. It is true that a man with the skill of the late Mr. Conington, instead of merely translating a line, may often so paraphrase it as at once to give his readers the same idea as is conveyed in the original, when a literal translation, unless it were backed up by a long antiquarian note, would have been altogether beyond their understanding. Nevertheless, if this is too frequently done, we have as the result such a work as Pope's *Imitations of Horace's Epistles*, which, admirable as it is in itself, and doubly interesting as it is to a man who knows Horace, yet to the ordinary reader is anything but Horace. But when once an English reader has first read with the care it deserves such a work as the one before us, he can then come to a translation of Hesiod or Theognis which shall be close, and yet shall be within his understanding. He will have found difficulties cleared away, what was unknown and strange made well known and familiar, and a languid curiosity oftentimes quickened into an eager desire. No one, we will undertake to say, can read Mr. Davies's brief account of Theognis, and the selections he gives from Hookham Frere's translation, without at once resolving to read the whole translation as soon as he can get at it. And not a few fair classical scholars who may chance to pick up this little volume will be led to read for the first time in the original, not only Theognis, but also Hesiod.

It is for "English readers," however, that these volumes are chiefly intended, and it is on them that they will confer the greatest benefits. It is not merely that they will open up to them a world which was almost closed, but that they will render them far more able than before to enjoy our own Eng-

* *Hesiod, and Theognis.* By the Rev. James Davies, M.A., late Scholar of Lincoln College, Oxford, translator of "Babrius." Edinburgh and London: William Blackwood & Sons. 1873.

link literature. We do not know that we should go so very far beyond the mark if we were to say that a man who is ignorant of the chief Latin writers loses quite as much when he reads English authors as when he does not read Latin authors. How much does a man lose, often indeed without knowing it, who, unfamiliar with Latin, reads Addison, or Fielding, or even Thackeray! The volumes in the series before us indeed, however well they may be done, will be very far from putting a man on the same level as the classical student; but nevertheless they will do a great deal for him. Many an allusion which before was dark to him they will make clear, and many a turn of thought which before would have seemed to him awkward they will at once render graceful. To the young classical student, too, we cannot but think that these volumes will render a great service. If at our great public schools no time could be stolen in the hours of leisure from cricket and foot-ball for a little quiet reading, nevertheless one or two of these volumes might with advantage be set as a pleasant task for each vacation. When we consider that the practice at all schools is not to read an author right through, but to familiarize a boy as far as can be with the style of as many authors as possible, it will be evident that any one whose mind is not utterly sluggish must often be eager to know what had gone before and what came after the part he had been set to study. A class reads perhaps some three or four books of the Æneid or of the Iliad, and then Æneas and Achilles, like personages who figure at a levée, have to stalk off and make room for others. In a levée no doubt a constant and rapid succession is pleasing enough; but when Turnus and Hector are still in the full tide of their success, we do not envy that boy who, as he leaves his Æneid or his Iliad, can be contented to leave these heroes too, utterly careless whether they win or lose. Moreover, how much better prepared would a lad enter upon the study of the *Georgics* if he had first read Mr. Davies's interesting chapter on the Imitators of Hesiod, and seen the source whence sprang that noble "glorification of labour" of the great Roman poet! Nay, how much better would he understand many minor points in Latin poetry—as, for instance, the great oath of the Gods, the swearing by the Styx—if he had read of the awful penalty which in Hesiod's *Theogony* we find inflicted on any god who, after taking that dread oath, was guilty of falsehood! To read a classical poet without a knowledge of Hesiod's *Theogony* is like reading *Paradise Lost* or the *Pilgrim's Progress* without a knowledge of the Bible. Notes, no doubt, in the one case or the other would supply all the necessary information; but while a student was finding out what was "that forbidden tree," and where was the river Styx, or Siloa's brook, or Mount Sinai, he would be in some danger of missing all the poetry.

Mr. Davies has composed his volume on much the same plan as the others of this series which have already appeared. He tells in an interesting manner all that is known of the life of each of the two poets, and, partly in his own words, partly in judiciously chosen passages from the various translations, makes his readers thoroughly at home with the subject of the poem. He has moreover an interesting chapter on Hesiod's Proverbial Philosophy, and another on his Imitators. We think it would have been well if he had thrown more doubt even than he does on the date when Hesiod flourished. He quotes Herodotus's statement that "Hesiod and Homer lived not more than four hundred years before," and further on he says that "tradition, so far as it is of any worth, corroborates the consistent belief of the ancients, that Hesiod flourished at least nine centuries before Christ." We hardly understand how tradition can corroborate a belief which was founded only on tradition; and as for Herodotus's statement on such a matter as this, it is, we conceive, of no worth, while the consistent belief of the ancients is, if possible, of less. Mr. Davies on this point follows Mr. Paley, to whom in his preface he expresses his great acknowledgments. But Mr. Paley of 1861, the year when his edition of Hesiod was published, is not the Mr. Paley of the present day. We should scarcely expect to find, after his Introduction to Homer, that he would rely either on tradition or on Herodotus. If a study of the language of these two early poets and of the customs they describe cannot fix the date when they flourished, nothing else can. Of the tenth century before Christ in Grecian history we know about as much and about as little as of the Court of King Arthur and of his Knights of the Round Table. In the Life of Theognis we find what is apparently a misprint in a date, which will no doubt be corrected in a later edition. It is stated that his life "is supposed to have lasted till beyond 480 B.C., as he distinctly in two places refers to the instant terror of a Median invasion." A man who died in 490 might have suffered from the terrors of a Median invasion, but he would have taken heart again at the great victory of Marathon. Later on, too, Mr. Davies says that "it has been surmised from his speaking of age and death as remote, and of convivial pleasures as the best antidote to the fear of these, that he was not of very advanced age at the battle of Marathon." Those who thus surmised must either have held antediluvian notions of what constitutes "very advanced age," or could scarcely have agreed with Mr. Davies in placing the poet's birth about 570 B.C. On these two points alone do we differ from Mr. Davies, unless perchance in the derivation, which he somewhat upholds, of parts of Hesiod's *Theogony* from the Mosaic Cosmogony. Though "the Hesperian maids"—

> Whose charge o'ersees the fruits of bloomy gold
> Beyond the sounding ocean, the fair trees
> Of golden fruitage—

are "ranked with Death, and Sleep, and Gloom, and its kindred, as the unbegotten brood of Night," we should not therefore be inclined to find the clue "in Hesiod's having a glimmering of the Fall and its consequences." Still less should we be inclined to find in one of the functions of Iris "a vague embodiment of the covenant sealed by 'the bow set in the cloud.'"

Perhaps one of the most interesting and original chapters in the book is that on Hesiod's Imitators, in which Mr. Davies more than anywhere else shows the width of his reading. We should be curious to know, however, if Mr. Davies ever thought of finding in the Icelandic literature a parallel not only to Hesiod in his proverbial philosophy, but also to Theognis in his repartees in verse. There is much in Mr. Morris's admirable translation of Grettir—perhaps the finest translation which this age of translations has seen—of which we are reminded by both one poet and the other. The proverbial wisdom of Grettir is scarcely, if at all, inferior to that of Hesiod; while, if the Greek poet delights in "the use of a characteristic epithet standing by itself for the substantive which it would commonly qualify (*e.g.* 'the boneless' to represent 'the caterpillar,' and 'the silvery' for 'the sea')," no less does the Icelandic hero. Who, again, who knows both works, when he reads the following retort of Theognis, will not be reminded of the way in which Grettir sang when he too was mocked?—

> But the love of music and song, which led him into the scrape, sufficed also to furnish him with a ready and extemporized retort to the girl's insinuation that perhaps his mother was a flute-player (and, by implication, a slave)—a retort which he, no doubt, astonished his audience by singing to his own accompaniment:—
>
> I am of Æthon's lineage. Thebes has given
> Shelter to one from home and country driven.
> A truce to jests: my parents mock thou not,
> For thine, not mine, girl, is the slavish lot.
> Full many an ill the exile has to brave:
> This good I clasp, that none can call me slave,
> Or bought with price. A franchise I retain,
> Albeit in dreamland, and oblivion's plain.

A better understanding can surely be got of the circumstances under which the early Greek poets wrote, and perhaps even of the date when they flourished, by the comparative study of the early writings of each Aryan race, than by a reliance on traditions or historians, or a reference to the writings of a Semitic race.

The English reader, we should imagine, while he will be greatly struck to find so much that is utterly unlike the world he himself knows, will be perhaps still more struck by finding so much more that is like. Mr. Davies often, by a happy turn or a happy reference, contrives to bring this home with great force. He shows how the "crinolines and dress-improvers," "the hatbands and scarves," the Carlton and the Reform, and the exiles "hobbing and nobbing over treason in some 'Leicester Square' tavern," all had their counterpart in ancient times. Curious it must be also for the modern reader to find that Sicily, which has for ages been sunk so low, "that isle of the West, was to Theognis's countrymen what America is to ours, the refuge of unemployed enterprise and unappreciated talent." Hesperia is ever flying westward. First it was Greece, then Italy and Sicily, next Spain, then America, and now it is America's western shore. Will it there, like Delos, become for ever fixed, or will it still sweep onwards towards the West, and at last return to that East whence first it started? Somewhat comforting, too, it will be to those who mourn over the good old times to find for how many ages the same mourning has gone on. Hesiod, like ourselves, had though the times were in which he lived, yet saw worse coming; for, in Mr. Davies's words,

> this iron age, at the transition point of which Hesiod's own lot is cast, shades off into a lower and worse generation, the lowest depth will at length be reached, and baseness, corruption, crooked ways and words, will supplant all nobler impulses,
>
> Till those fair forms, in snowy raiment bright,
> From the broad earth have winged their heavenward flight,
> Called to th' eternal synod of the skies,
> The virgins, Modesty and Justice, rise,
> And leave forsaken man to mourn below
> The weight of evil and the cureless woe.

"English readers," especially young "English readers," will perhaps be less inclined to put all their trust in Mr. Carlyle or in Mr. Ruskin when they find how many hundreds of years it is since the world was thought to be getting to its very worst, and how at that very same time it was rising, with Mr. Gladstone's strides and bounds, to a degree of greatness which it had never before attained. Had we space at our command we might go on further to show how admirably adapted this series is for the general reader, and how well Mr. Davies has done his part of the work. If we break off here in our praises, it is most certainly not, to quote one of Hesiod's proverbs, because we are like those who spare the liquor when the cask is empty.

ERMA'S ENGAGEMENT.*

HAD *Erma's Engagement* been stronger, it would have been a noticeable book in its way. As it is, the combination of "purpose" with lollipop, of advanced strong-mindedness with flowery sentimentality, is not conducive to its sterling value; and we find ourselves involuntarily wishing that the author—or, shall

* *Erma's Engagement.* A Novel. By the Author of "Blanche Seymour." 3 vols. London: Tinsley Brothers.

we say, authoress?—had kept more distinctly to one or other of the two lines, and had been either less full of political doctrine or more sparing of dollish prettiness. "Woman's Rights," when preached by such an apostle as Ermengarde St. Barbe, and practised by such a professor as Mrs. Harley, could not fail to make converts by the very force of individual influence. If two such women had illustrated Mormonism or Thuggism, they would have made the one respectable and the other righteous in the eyes of many, because of their supreme personal attractiveness. But we must not forget that the advocates of a theory have it all their own way in a novel, just as a clergyman has it all his own way in the pulpit. In the interests of justice the portrait of the man painted by the lion ought to be accepted at times; and even the devil's advocate has his uses.

Erma's Engagement is a fair example of this kind of special pleading. Its backbone is the woman's question, and the author has not, as painters say, starved her palette. There are two advocates of woman's rights in the story, Mrs. Harley, and her friend and disciple Ermengarde, or Erma, St. Barbe. The former is a mere shadow, a kind of impersonal principle moving through the pages under the name and style of an everyday woman, but without tangible individuality. She is a wife and mother, passionately opposed to the theory of womanly sacrifice and wifely submission, while in practical reality she lives only to please her husband and to love and educate her children. The latter is a young girl, bright, brave, conscientious, loving, who has learnt to think for herself, hence to doubt and to choose, but whose conduct is regulated by the strictest principles of obedience to her parents, self-surrender to conventional duty, and later, when she marries, of wifely self-suppression to the most extreme point to which amiability can lead a woman. Here, then, lies the radical weakness of the book. The author has not had the true courage of her opinions. No one would find fault with theories that led to such results as these; but they are not the logical results of the theory advocated. Had Erma been faithful to herself, she would have held by her new principles rather than her old teaching, when the two clashed. She would have married Cecil Erristoun, in spite of them all; or, having married Frank, she would have suffered from the mistake of her conformity to an unrighteous code. As things are, she is in the position of one who makes the best of both worlds, and serves God and Mammon with equal success. She gives up the man she loves, and marries the man she does not love, out of obedience to her parents, and because of that very law of womanly self-sacrifice to the wishes and well-being of a man which she so warmly condemns. But she is happy and virtuous with her unintellectual, good-tempered young Nimrod: and she keeps her money by her marriage, which else she would have lost. Then she marries Cecil after all, when poor Frank has conveniently coughed himself out of the way; whereby every one is content, and the wrong is righted before it is too late. All this is absolutely untrue to the dominant principles of the book. It is as if the author had undertaken to curse the law of womanly submission, but had blessed it unawares instead; unless, indeed, she means to show that out of evil comes good, and that a woman with the right kind of political principles can make even an ungenial marriage a success, and sacrifice more dignified than self-assertion. In which case is she not playing into the hands of the enemy—keeping the key of the citadel while showing the way through the breach?

To our thinking, however, Erma did wrong in marrying Frank. She had allowed herself to drift into a settled engagement with him, in express opposition to the terms of her aunt's will, and against her own better judgment and feelings. Having made this mistake, which neither her father nor her mother, nor yet her grave and sensible half-brother, had honesty enough to rectify, she falls in love with her ideal, Cecil Erristoun; he also with her. Her cousin Frank is handsome and good-natured, an athlete and no scholar, muscle not brain, a gentleman but a simpleton. She herself is enthusiastic for knowledge, a reasoner on her own account, bitten with all the new doctrines, and a natural sceptic. The marriage of two such people is the old union of the fire and the clod; and one that no woman who respected herself, even if she were not of the woman's rights' school, would make. And certainly, if there was another and a truer love in the background, it was a union which carried with it a certain taint not pleasant to contemplate. But Erma, who at one time declaims violently against the idea of marrying a man because he was going to the bad through disappointment, when her trial really comes, consents to throw over Cecil—after she has engaged herself to him during an interregnum when Frank in a pet has given her up—and to take on herself again a yoke which had galled her unspeakably before. It was not worth while being Mrs. Harley's disciple to come to this conclusion. Any meek-minded Griselda would have done the same, though few would have made so good a job of her misfit as did Erma, who by the very poetry of submission reigns supreme. Nor, we may add, would many young men who had gone so far as Frank on the perilous incline of debt and dissipation have been able to pull themselves up again with such perfect success as he. After his marriage he improves wonderfully. Whether the heart of the auil or snuite her for her cruelty in binding the high-minded Erma with a curly-headed well-bred loon, or whether she relented towards Frank himself, and out of her own pure grace endowed him with the rudiments of a soul and some germs of intellect, we have no means of judging. Sure it is, however, that after he has conquered fate and Erma he becomes comparatively æsthetic and sentimental, and is really not so bad a fellow, take him all in all, as many who look his betters. He is very naturally drawn, save that he has more poetic tenderness at times than would belong by right to such a dense-witted athlete; but we should imagine he must have been somewhat in awe of his very superior wife; and it speaks volumes for his good-nature or obtuseness that he kept to his love so long and so loyally.

The family of the St. Barbes are people given to much demonstration, and "making a fuss" seems to have constituted their normal condition. All their heart-breaks, and quarrellings, and love-makings, and reconciliations are transacted in public, and the servants understand the drawing-room barometer as well as the family themselves. Anything serves them for a scene; and the scenes are admirably described. Thus, when Erma in the prospective exercise of her proprietorship of Dunville, announces her intention of giving a piece of land to the Dissenters for their chapel, in opposition to the wishes of her High Church parents and their Anglican pastor, she rouses up a violent storm, which Beatrice, familiarly called Bea, the younger sister, shall tell in her own way, because she tells it with the true domestic point and humour:—

"My dear Frank, you never witnessed such a scene," said Beatrice. "Papa stormed, Mr. Wynne looked like the Grand Inquisitor, only language failed him to express his indignation, and mamma scolded poor Erma like anything. Then she told her to go and kiss papa, and say she was sorry, but he was too angry to be mollified, and would not kiss her, upon which she sat down on the sofa, and cried like a Madeleine. Then mamma, who is always in a state if Erma cries, cried too, and said we all combined to break her heart, and that Erma would not have a single eyelash left; and I cried, and Charlie cried, and we all cried."

"Good Heavens!" ejaculated Frank, "what a *tapage!*"

"Then, when he saw mother cry, papa relented and kissed Erma, and we all subsided."

"And Wynne?"

"Oh, I'm sure he said a *De Profundis* to himself while the storm lasted, for, used as he must be by this time to the family excitability, I think he was fairly astonished at the scene that day, and thanked God that he was a bachelor. Afterwards Erma went up to him—don't you know her way? half shy and half proud, and getting very red—and said she was sorry; so he was mollified, and gave her absolution."

"And I suppose Uncle Harry was all right afterwards?"

"Oh yes, and Erma went and sat on his knee, and he kissed her, and made ever so much fuss about her, and came into our room when we were going to bed to say 'good night' to her again, and all that."

They are always having these breezes, proud and conventional as they are; and a breeze affords Mrs. St. Barbe cause to be "at" Erma for wrinkling her forehead when she talks, and for rubbing her eyelashes out of her eyes when they are swept therein by the tears which come so readily. Here is a case in point, when Erma is refused leave to go to London with Mrs. Harley to hear lectures and learn science:—

"Now, don't be vexed about it, Erma, and cry and spoil your eyes," pleaded Mrs. St. Barbe. "You are so excitable, and work yourself up into a state about everything." The girl dashed away her tears.

"*Don't* rub your eyes in that way, I implore of you," went on the lady in a despairing tone; "you wont leave yourself an eyelash."

There did not, at present, seem much probability of such a disaster. Miss St. Barbe's long, silky lashes were one of the beauties of her face, but tears had the unpleasant effect of sweeping them into her eyes, which she would then rub vigorously, much to her mother's horror. A slight passage of arms between the pair usually ensued; the young lady would protest that eyelashes were a matter of perfect indifference to her, while her mother would insist on their beauty and utility. On the occasion in question Erma withdrew her handkerchief from her face, and contented herself with blinking her eyelids energetically to restore the lashes to their normal condition. The fact was that she espied her father in the distance, and to be seen in tears by a man was, in her opinion, the lowest depth of degradation; though she had not unfrequently experienced the potency of those feminine arguments in the limited dealings she had hitherto had with the sterner sex. But that was in the days of her youth; now she deemed it unworthy in the last degree to use such weapons, and the readiness of her large eyes to fill with tears on the slightest occasion was one of the greatest trials of this period of her existence.

There is a very good scene too between Erma and her mother, when the latter is trying to induce her to give up Cecil on the score of poverty. "Love is all very fine"—she says; "I married your dear father because I loved him—but you can't dress on it, nor keep a man in good humour on it. How would you like to be sworn at," she goes on to say, "when he comes home tired to an uncomfortable, badly cooked dinner?"—

"He wouldn't swear at me," said Erma, her face flushing at the aspersion.

"Of course not! It is well known that men never do. George Travers never was to swear at Mary St. Barbe! Her dear, noble George! Ask her about the matter now! She chose to marry a rising barrister who never rose, and they have to live on a halfpenny a year. You don't know what that is. You have only lived with men who never in their lives had to think how sixpence was to be made to do the work of a shilling. It is a very different thing when a man is perpetually harassed by small means and repeated calls on them. No temper can stand the perpetual strain. You judge from your own point of view. You don't mind an uncomfortable dinner, but a man does; it makes him cross and he scolds his wife, and she finds that it is not all smooth sailing, and is moped and miserable, and loses her good looks and all the attractions that first won him; cries perhaps, and that worries him, and so they go on from one thing to another, soured and miserable."

The conversation ends triumphantly for the mother, who demonstrates the utter folly of Erma's thinking of Cecil Erristoun, notwithstanding his brains, his heroic qualities, his M.P.ship, and his devoted love, by the final arguments, "Who is to do your hair? You can't do it yourself"; and, "You are not fit for a poor man's wife, Erma. Why, you could not sew on a shirt-button for him!"

There is an under plot, or rather a side interest, in the story of

Cecil's wilful sister and his orphan nephew, whom Erma takes up as a little newspaper boy at the corner—a street waif needing care—not knowing who he is. But the episode has nothing to do with the main thread of the plot, save indeed as another example of brutality in husbands, and of the down-trodden condition of wives. Johnnie himself, the nephew in question, is one of the moving shadows of the book; no more. We get no more hold of him than of Mrs. Harley; for though the story has many clever points and graphic touches, it does not always make definite pictures. But indeed we think the whole episode a mistake and an excrescence. Yet, with undoubted defects, *Erma's Engagement* has merit of a kind. There is a tendency in it to stray from the original landmarks which betrays want of grip, and the author has not stood with sufficient steadiness by her flag. All throughout men are represented as normally selfish, brutal, tyrannical to women, self-indulgent, sensual; and we ourselves come in for a feminine fling, characteristic, to say the least of it; but the old leaven is too strong for the new, and the result of the book, after all its frothy talk about woman's rights and woman's wrongs, is woman's self-surrender to the law of love and feminine duty, and the finding of her happiness therein.

GERMAN LITERATURE.

ENGLAND has seldom impressed her peculiar genius more profoundly on the history of the world than by the medium of John Wickliffe.* The hapless Albigenses, easily confounded with Wickliffe through their similar character as reformers, were actually severed from him by a wide interval of feeling no less than of opinion. They were religious revolutionists, whose Pantheistic creed had emanated from Oriental sources. In Wickliffe the world beheld the first endeavour to reconstruct the Church on conservative principles, and his *via media* has ever since been characteristic of average English opinion. Any good book on such a man must always be acceptable; and no apology for this last addition to the list is due from Dr. Lechler. It must perhaps be admitted that the author's qualifications consist rather in his zeal for the subject, and in the earnestness with which he has applied himself to master the materials already extant in print, than in any considerable addition which he has been able to make to ordinary sources of information. We must confess ourselves at least somewhat disappointed at what would seem the comparatively slight value of the forty volumes of unpublished MSS. by and relating to Wickliffe which he has had the opportunity of examining at Vienna and Dresden. If he has really turned them to the best account, it can only be said that their chief importance, as transcripts made by Bohemians, is that of illustrating the congeniality of Wickliffe's doctrines to the highest Slavonic civilization. It might also have been more distinctly expressed in the title how largely the book is devoted to the precursors and successors of Wickliffe in England and elsewhere. With these reservations, we have little but praise for a work of singular research, perspicuity, and sobriety. A laudable endeavour after absolute precision has sometimes rendered the diction more diffuse than was needful; in general, however, the style is pleasant and natural. The first chapters are devoted to an account of Wickliffe's predecessors in the reform of abuses in discipline rather than of corruptions of doctrine, especially Grossetesto, Bradwardine, Richard Archbishop of Armagh, and the author of *Piers Ploughman*. Then succeeds the life of Wickliffe himself, full justice being rendered to the activity in public affairs which his fame as an ecclesiastical reformer has somewhat thrown into the shade. The second volume is occupied by the history of the Lollard and Hussite developments of Wickliffism, and is concluded by an appendix containing specimens of Wickliffe's hitherto unpublished writings. On the whole, if the work contains little that is positively novel, it is probably the most comprehensive survey extant of the early period of the Reformation throughout all its numerous ramifications. The author's point of view is that of an orthodox Lutheran; his impartiality and moderation are exemplary; and he clearly discerns the cardinal fact that the seeds of the great religious revolution of the sixteenth century, no less than of the great intellectual and political revolution of the eighteenth, first germinated on English ground.

Pastor Werner's book on Herder† as a theologian is able and interesting, but too long and exhaustive to be generally consulted except by professional readers. This is to be regretted, as Herder's character as a popular theologian would have warranted a lighter style of treatment, and Herr Werner's ability and impartiality merit a wide circle of readers. He is in love, but not too much in love, with his subject. He admits that the positive results of Herder's biblical criticism have been insignificant, but justly claims for him the distinction of having exemplified a new spirit, and introduced a new era of inquiry, forming him, by a happy phrase, the Winckelmann of the Old Testament. The great source of Herder's influence, however, is to be found in his views of humanity, and their practical application to ecclesiastical doctrine and discipline—a part of the subject discussed in the most sympathetic and appreciative spirit by Herr Werner.

Professor Bernhard Weiss's work on the Gospel of Mark‡ is one of the most important recent contributions to New Testament criticism. The writer endeavours to establish the authenticity of Mark's Gospel, with the exception of the last eleven verses, its priority to Matthew and Luke, and the substantial accuracy of the ecclesiastical tradition which represents it as composed in accordance with the oral testimony of Peter. It is, in fact, the first Gospel in the sense of a regular narrative; the earlier work of Matthew, in its original form, having been a mere report of sayings or discourses. These views are supported by a most patient, laborious, and analytical comparison of Mark with the parallel passages in the other Synoptic Gospels.

The attention which we have elsewhere bestowed upon the proceedings of the Vatican Council† renders it unnecessary to here refer to Herr Frommann's history of it otherwise than as to a standard contribution to the subject, the production of one well acquainted with the intrigues of the Roman Curia, and whose point of view is less that of a theologian than of a canonist. The proceedings of another and much more satisfactory Council are published in the ample Report of the discussions of the Congress convened at Eisenach‡ in October last, for the consideration of social and industrial questions. The moving spirits of the Assembly, among whom occur the well-known names of Dr. Gneist and Dr. Brentano, appear to belong to that modern school of German political economists which endeavours to steer a middle path between Socialism and the absolute *laissez-faire* of the Manchester school. It is in general favourable to combinations among the working classes, rather, however, for mutual insurance and protection against oppressive employers than for the purposes of co-operative industry, respecting the feasibility of which some scepticism appears to exist. Three principal subjects were proposed for discussion—industrial legislation, trade-unions, and the provision of dwellings for the working classes. A report was read upon each, and followed by a long and animated debate. The general view of the speakers appears to be that German industry is successfully striving to adapt itself to a new condition of things, and the point which creates principal anxiety is the deficiency of house accommodation for the working classes, whose condition in this respect is indeed most serious.

Dr. Lazarus's discourse on the part played by ideas in shaping the destiny of nations§, although obscured by metaphysical subtleties, is in the main a worthy tribute to the influence of the solitary thought of individuals and the corporate enthusiasm of masses in determining the course of human affairs. If we are to conclude that it was pronounced precisely as it is printed, and apprehended perfectly as it was delivered, we can but congratulate Dr. Lazarus on having addressed an audience distinguished by sedulousness of attention and quickness of apprehension above all others in the universe.

The result attained by Herr Hensler's essay on the Municipal Constitutions of the Cities of the German Empire‖ is that they are a development of the old Frankish constitution; and he controverts the theory which makes them dependent on the first public documents in which they are distinctly recognized, the charters of Otho the Great and his immediate successors.

The general tendency of the essay on the Constitution of the modern German Empire, by Joseph von Held, a Bavarian publicist¶, is to insist that it can only be regarded as a temporary arrangement, which must result in a more logical application of the principle of national unity at the expense of the minor States. At the same time he is by no means an advocate for the unconditional supremacy of Prussia. An appendix contains the full text of the German Constitution, and of the treaties between Prussia and the Southern States.

The dispassionateness and precision which constitute the most distinguishing qualities of Leopold von Ranke** appear perhaps even to more advantage in minor historical studies than in narratives on a large scale. In the latter we have been taught by great examples to look for something of the grand style, for ornateness of diction, ingenuity of construction, animation of description, and liveliness of feeling. The disappointment produced by the absence of all these attractions is largely tempered when the writer, as here, presents himself from the first in the character of a sedulous scrutinizer of isolated historical problems rather than as a combiner of the general facts of history into an artistic whole. This very agreeable volume, a model of terseness, lucidity, and impartiality, is mainly occupied with researches into obscure or controverted points of the history of the House of Brandenburg, the credit (not too great in Ranke's opinion) due to the memoirs of the Margravine of Baireuth, the original draft of Frederick's history of his first Silesian campaign, his correspondence with the

Prince and Princess of Orange, and the secret history of the fall of his grandfather's Minister, Dankelmann. Information on the last point is chiefly derived from the papers of the English diplomatist Stepney, preserved at the Hague. There is also an interesting essay on the democratic and tyrannicidal tendencies of the Jesuits, not improbably destined to be revived if the present antagonism between the Church of Rome and the secular power should continue; and another on the origin of the doctrine of the triple authority—legislative, executive, and judicial—which is examined by the light afforded by Milton, Algernon Sydney, and Hobbes.

The discovery that the physiognomies of German statesmen of the last century are in general distinguished by self-complacency has suggested to Herr Sebastian Brunner * the quaint title of his collection of unpublished excerpts from their correspondence. We could well have borne with less humour in the visages if only there had been more in the letters; and when Herr Brunner takes credit for having brought so much unknown matter to light, we feel that we could have accorded him even more if he had left it where he found it. In fact, these two volumes, chiefly made up from the correspondence of diplomatic agents at the Courts of the spiritual princes, contain very little of general value or interest. There are, no doubt, some curious illustrations of the manners of the age, especially as regards its staple occupations of toping and boar-hunting. There is plenty of low intrigue and self-seeking; so that we decidedly agree with the editor that the effect of his collection is not to exalt one's conceptions of the old German Empire in its decrepitude, and we consider that it should tend to put German readers into charity with the French, but for whose interference things would still be much as of old. The pleasantest part of the book is the glimpse it affords of a real patriot and reformer, Joseph II.

The name of the editor of the *Poetæ Lyrici Græci* is a sufficient guarantee for the scholarship essential to the satisfactory execution of a history of Greek literature.† It is needless to point out how vastly more ample a scope of acquirement, no less than of original faculty, is necessary for the full mastery of a subject touching at some point or other on nearly every department of human activity; and no higher praise can be bestowed on Herr Bergk than to say that he appears in a fair way to provide the world of letters with a standard work on his magnificent theme. It must, however, be borne in mind that his present volume, treating of the linguistic foundation and earliest beginnings of Greek literature, deals with those portions of the subject in which he may be supposed to be most thoroughly versed. Should his treatment of Grecian history, eloquence, and philosophy prove equally satisfactory, his work may probably occupy such a position towards Ottfried Muller's as Mr. Grote's history holds with reference to Bishop Thirlwall's—superior, not in the genius of the writer, but in the comprehensiveness of the plan. To complete the parallel, Bergk's erudition is less polished and condensed than Muller's, and the work will probably be more acceptable to men of erudition than to readers of general culture. Yet, although the stamp of supreme literary finish may be absent, it is far from being formal, dry, or repulsive, while it excels in masculine common sense. Any deduction from this latter characteristic, should any have to be made, must be on account of the most difficult of the literary historian's problems—the Homeric poems. On the one hand we are highly gratified by the vigour with which Herr Bergk sweeps away the standard sophisms by the aid of which Homer is resolved into a myth. He places him, indeed, a century and a half earlier than usual: and even granting this to be an excess of conservative reaction, his argument for the existence of writing at the period is a powerful contribution to the traditional side of the controversy. We feel more dubious as to the soundness, while unable to refuse admiration to the ingenuity, of the patient analysis by which he strives to establish the existence of two Homers—the inspired bard himself and a later imitator of far inferior faculty, in whose hands the epic assumed nearly its present shape. As he regards the other interpolations as comparatively insignificant, and considers the older and younger Homers as but little removed in point of date, the unity and authenticity of the Iliad are substantially asserted even by this hypothesis. While bestowing the highest eulogiums on the Odyssey, he considers it to be the work of another and a somewhat later writer. The genuineness of Hesiod's *Works and Days* and *Theogony* is maintained, and the interesting chapter on this subject is distinguished by sobriety, due respect for ancient authorities, and willingness to acquiesce in ignorance where ignorance cannot be helped. The volume comes down to the first Olympiad, so that the next will embrace the subject which Bergk has made pre-eminently his own—that of Greek lyrical poetry.

The late Immanuel Bekker's notes in illustration of Homer ‡ are rather of literary than of philological interest. They consist mainly of a series of parallel passages throwing light on the manners and customs described by Homer, selected from the mediæval French and German metrical romances, and from the Mabinogion. The field thus indicated may prove fruitful, and would certainly admit of a more ornate and discursive method of treatment than Bekker's, whose style is of the curtest and driest, the very shorthand of literature.

Dr. J. H. Schmidt's great work on Greek metre * is at length completed. It is a herculean labour, requiring even in the reader more knowledge both of Greek and of music than is likely to be often united in the same person. Considering its abstruse character, it seems extraordinary that so bitter a controversy should have been excited by it as seems from the preface to have been the case.

Not much can be said in favour of the two volumes of Prince Pückler-Muskau's letters †, which accompany the biography we noticed last month. The most interesting speculations which they suggest are how Madlle. Assing ever got hold of them, and how it comes to pass that there is no law in Germany to restrain the publication of the letters of living persons without their consent. We cannot conceive that the permission of Countess Hahn-Hahn or Madlle. John (E. Marlitt) to the publicity of their familiar correspondence was obtained or even requested; not that there is anything that these ladies need regret, and in fact the latter exhibits good sense, good feeling, and feminine adroitness in her dealings with her octogenarian beau. Poor Puckler evidently wished to revive the impression of bygone flirtations with Bettina von Arnim, and there is something equally ridiculous and mournful in these vain endeavours to rekindle the simulacrum of a flame that never had warmth enough to burn anybody's fingers. The correspondence with Bettina is a weary business on both sides; some of the other letters, to comparatively undistinguished persons, are less ambitious, but considerably more in earnest.

The especial object of Herr Fritz Krauss's elegant version of Shakspeare's Sonnets ‡ is to render them popular with German lady-readers. He endeavours to attain this end by omitting all after No. 126, and by prefixing a dissertation explanatory of difficulties and ambiguities. His principal guide is Mr. Gerald Massey, and the nature of his solution is indicated by the title of his volume.

Although by this time not a very recent production, J. V. Widmann's *Buddha* § demands a word of notice both on account of the subject and of the qualities displayed in the treatment of it. The poet's theme is the life of Sakhya Muni, in narrating which he adheres pretty closely to tradition, rejecting the grotesque exuberances of Buddhist legend, and interweaving such episodes as appeal most nearly to universal human feeling. The gentle heroism of the ascetic sage is well adapted to poetical treatment, and although the writer is not a bard of the first rank, he is by no means incapable of sustaining, adorning, and diversifying the subject. His metre is the octave stanza, which he handles with great felicity.

The author of *Debit and Credit* would indeed have added a wreath to his laurels if, in his bold attempt at historical fiction in a remote era, he had displayed as much versatility of style as of subject. Unfortunately he is still the same realistic and somewhat prosaic Freytag; his Vandals and Wends are substantially personages of the nineteenth century; and the matter-of-fact exactness which is laudable in a delineation of contemporary manners is fatal to the imaginative instinct which alone can restore the lineaments of a bygone age. At the same time "Ingo and Ingraban" ‖, if not picturesque or exciting, are a pair of highly respectable romances; the author has manifestly done his best; we cannot but admire the fulness of his knowledge and the elaboration of his literary workmanship, and must admit that the cause of his failure to bring a vivid picture before the eyes of his readers can only be found in the comparative feebleness of the imaginative faculty which disables him from conceiving one himself. Literary skill has achieved everything within the scope of its resources; but to people the phantom-haunted night of time with substantial figures requires something more than effectiveness in isolated descriptions and a general air of reality in narrative, both of which the work certainly has. "Ingo" is a romance of the middle of the fourth century. "Ingraban" depicts the conflict of German and Slavonic races and religions in the time of Charles Martel. Both are designed as members of a series of tales extending through several ages, the principal actors in which are supposed to be connected by descent, as in Eugène Sue's *Mystères du Peuple*.

The "Seven Deadly Sins," by Robert Hamerling ¶, is a cantata in three parts, respectively depicting the incursion of the representative demons of these vices into our planet, the success which unfortunately attends them, and the rally of mankind and its auxiliary angels for their expulsion. The whole is too obviously fanciful, but there is no lack of lyrical feeling, either in the spirited diction or in the partly rhymed, partly alliterative metre.

By Order of the Committee,
F. K. J. SHENTON, *Sup. Literary Department.*

UNIVERSITY COLLEGE, London.—HISTORY of PHILOSOPHY.—Professor CROOM ROBERTSON will begin a COURSE of TEN LECTURES on the Philosophy of Kant, with special reference also to Hume, at 4·30 P.M. on Wednesday, January 22, and will continue the Course on subsequent Wednesdays at the same hour. Fee for the Course, 31s. 6d.
JOHN ROBSON, B.A., *Secretary to the Council.*

CLIFTON COLLEGE.—SCHOLARSHIPS.—The following will be open for Competition at Midsummer next: 1. One or more Entrance Scholarships of the value of £50 a year during the holder's stay at the College. 2. The Guthrie Scholarship of £70 a year for Two Years, for Boys under Seventeen. 3. One or more of £35 a year for Two Years, or till election to another Scholarship, for Boys under Fifteen. 4. One or more of £35 a year for Two Years, or till election to another Scholarship, for Boys under Fifteen. An allowance for age is made in favour of Young Boys for Nos. 1 and 3.—Further information may be obtained of the HEAD-MASTER, or BURSAR, The College, Clifton, Bristol. Boarders re-assemble on Tuesday, 21st inst.
The College, Clifton, January 15, 1873.

CHELTENHAM COLLEGE.—TWELVE SCHOLARSHIPS. Two, £50; Six, £40; Four, £30. Election, Second week in May.—Apply to the SECRETARY, The College, Cheltenham.

QUEENWOOD COLLEGE, near Stockbridge, Hants.—The FIRST TERM of 1873 commences January 15 and ends April 9. Preparation for the London Matriculation, and for the Royal College of Surgeons.—For Particulars, apply to
C. WILLMORE, *Principal.*

THE LONDON INTERNATIONAL COLLEGE. Founded under the auspices of the late RICHARD COBDEN; inaugurated July 10, 1867, by H.R.H. the Prince of WALES.
Principal—Dr. L. SCHMITZ, F.R.S.E., late Rector of the High School, Edinburgh.
Vice-Principal—M. S. FORSTER, B.C.L. M.A., Oxford.
This College assigns a prominent place in its Curriculum to Modern Languages and the Natural Sciences.
The WINTER TERM will COMMENCE on Saturday, January 18, 1873.
Applications for Admission should be addressed to the PRINCIPAL, or to the SECRETARY, at the College, Spring Grove, near Isleworth, Middlesex.

TRINITY COLLEGE, Glenalmond, Perth, N.B.
Warden—Rev. R. THORNTON, D.D. Oxon.
A School on the model of the greater Public Schools of England. Terms (including every necessary expense), 80 and 90 Guineas, according to age. There is also a Theological Department, for Candidates for Holy Orders. Particulars may be obtained from THE WARDEN.

RAMSGATE COLLEGE SCHOOL.—The next Term will commence on January 28, 1873.
Head-Master and Principal—Rev. THOMAS STANTIAL, D.C.L. Oxon.
Vice-Principal—E. G. BANKS, Esq., M.A., Worcester College, Oxford, Graduate in Classical Honours; assisted by Graduate Masters of experience.
Many Pupils of this School have recently taken high Honours at University and other Competitive Examinations, of whom a List will be furnished on application. For a prospectus of Terms, &c. apply to the Rev. Dr. STANTIAL, Chatham House, Ramsgate.

TRUST for carrying on the NORTH LONDON COLLEGIATE and CAMDEN SCHOOLS for GIRLS.—The Camden School for Girls was Re-opened on Tuesday, January 14, 1873. The North London Collegiate School for Girls will RE-OPEN on Tuesday, January 21, 1873.

LADIES' SCHOOL, Mary Street House, TAUNTON, for the Daughters of Clergymen, Professional Men, and Gentlemen.—The Education given is a thoroughly sound one, and the assistance of experienced Masters is procured in the study of those branches of learning which are generally neglected in the education of Ladies. The real work done is tested by the College of Preceptors and the Oxford Local Examinations, and by examinations carefully conducted in the School itself. Four Pupils passed the Senior Oxford Local Examination and Two the Junior, in June last. And at the Christmas Examination of the College of Preceptors, Eight Third Class, Five Second Class, and Three First Class Certificates, including special and Honour Certificates, and the College First Prize for English subjects, were gained by the Pupils. Inclusive terms do not exceed 50 Guineas per annum.—Full particulars will be forwarded on application to the LADY-PRINCIPAL. The highest references given.

EDUCATION.—The Misses CASSAL and NELIGAN, successors to Miss BUSH, have a few VACANCIES for RESIDENT PUPILS. Term will begin on January 22.—3 College Villas, South Hampstead.

EDUCATION.—STREATHAM SCHOOL.
Head-Master.
Rev. R. LEWIS, M.A., late Scholar of Jesus College, Oxford, and Graduate in Honours.
The course of Instruction comprises the subjects usually taught at the Public Schools, and includes a sound Classical, Mathematical, and General Education. Special preparation for the Public Schools, Universities, and Competitive Examinations. One Resident Master to every ten Boys. Testimonials from the Principal of Cheltenham College, Masters at Rugby, &c. The School is situate in one of the prettiest and healthiest villages of Surrey, facing a common of 70 acres well adapted for out-door recreation. A good Cricket and Football Club. Excellent Library, Playground, Gymnasium, Bath-room, &c.
A Prospectus with Honours List will be sent on application.

SHIREHAMPTON, near BRISTOL.—A limited number of PUPILS are prepared for the Universities, Public Examinations, or General Life. The Principal has had many years' experience, was for many years Head-Master of Kingswood School, Vice-Principal of Huddersfield College, Classical and Mathematical Examiner of Taunton College, of the Baptist College, Bristol, Classical Examiner of the late Bristol College, also of Kingswood School, Bath; Author of the "General Theory of Grammar," and of Special Grammars of the Classical and several modern Languages; Member of the London Philological and Mathematical Societies, &c.
Many Pupils have been successful at Oxford, Cambridge, Dublin, and Edinburgh Universities; at Addiscombe, Woolwich; at Naval, Actuary, Law, and Pharmaceutical Examinations, &c.
SAMUEL GRIFFITH.

PREPARATION for ETON, HARROW, &c.—In a high-class School for the SONS of GENTLEMEN in the neighbourhood of Hampstead there are now VACANCIES. As no strongly coercive measures are adopted, none but gentlemanly, well-disposed Boys can be received. The Domestic arrangements are upon an unusually liberal scale and as nearly as possible those of a Private Family. Each Pupil has a separate bedroom. Inclusive Terms, 80 and 100 guineas per annum.—Address, M.A., care of Messrs. Kinsey & Ade, 9 Bloomsbury Place, London, W.C.

WOOLWICH, COOPER'S HILL, INDIAN CIVIL, and LINE.—Rev. Dr. HUGHES (Wrang. Joh. Col. Cam.), who has since 1850 passed over 300, with ample Assistance (Classical Gold Medallist, &c.), prepares TWELVE PUPILS for the above.—Ealing, W.

FOLKESTONE.—The Rev. A. L. HUSSEY, M.A., Ch.Ch., Oxford (late of Petersfield House, Bucks), PREPARES BOYS of Nine and upwards for Eton and other PUBLIC SCHOOLS, at Durham House.

OVERSLADE, near Rugby.—A High-Class PREPARATORY SCHOOL, under the Rev. G. F. WRIGHT, M.A., late Fellow of C. C. C. Cambridge, formerly Assistant at Shrewsbury and Wellington College. Large, Isolated Country House, with private Chapel attached; Cricket Field of Nine Acres; Gymnasium under qualified Instructor.

COOPER'S HILL, WOOLWICH, CEYLON WRITERSHIPS, CIVIL SERVICE, &c.—Mr. W. M. LUPTON (Author of English History, Arithmetic, and Chemistry) has been very successful in preparing CANDIDATES for the above Examinations.—Address, Sedbergh House, South Hill Park, Hampstead, N.W.

PUBLIC SCHOOLS.—The RECTOR of a small Country Parish, on the G. W. R., in Oxfordshire (Classical Honours, Oxford), formerly Assistant-Master in one of the great Public Schools, Nobleman's Chaplain, &c., who is preparing his own Sons for Eton, receives FOUR LITTLE PUPILS, under Fourteen, for the Public Schools, &c. Testimonials from Archbishop of Canterbury, Bishops of Exeter and Calcutta (late), University Professors and Examiners, Head-Masters of Public Schools, Parents of Pupils, &c.—Address, M.A., care of Messrs. Slatter & Rose, Booksellers, Oxford.

A GENTLEMAN (formerly in the Army), Married, living on his own Estate, in one of the best parts of Hants, assisted by a Militia Officer of great Experience in Tuition, wishes to receive SIX PUPILS to prepare them for the University, Civil Service, and Competitive Examinations. Both Gentlemen well versed in Modern Languages acquired abroad. Church of England. The Advertiser, from his position, can offer exceptional Advantages. Highest references given and required.—Address, C. C., King's Library, Alton, Hants.

EDUCATION in GERMANY.—The INTERNATIONAL COLLEGE, Godesberg, near Bonn, on the Rhine. *Principal*—Dr. A. BASKERVILLE. Terms, 80 Guineas per annum.—For Prospectuses and References, apply to J. Kegan, Esq., 29 Westbourne Park Terrace, Harrow Road, London.

AMALIENBERG CASTLE, Murgthal, G.-D. of Baden. Under the Patronage of H.R.H. the GRAND-DUCHESS of BADEN.
The study of German and French having become lately most important to English Students, Dr. HEDLER has made arrangements to receive at Amalienberg SIX ENGLISH GENTLEMEN, who wish to acquire in a short time a thorough knowledge of French and German. Amalienberg Castle is considered one of the finest places in the Grand Duchy, and offers all the comforts of a gentleman's private residence. Hunting, Fishing, and Shooting in the neighbourhood. References exchanged. One of the Partners is now in London, and will be happy to see Parents or Guardians at 29 Hollis Street, Cavendish Square, any day from Eleven to Three, except Saturdays.

PUPIL.—A GENTLEMAN, who has the Management of considerable Property in Kent, is prepared to receive into his Family a YOUNG GENTLEMAN wishing to be Instructed in the Duties of a LAND AGENT.—Address, X. Y. Z., Mr. Snelling's Library, Tonbridge.

A CAMBRIDGE GRADUATE, Second Class Classical Honours 1858, late Scholar of his College, and of a Public School, desires an Engagement as TUTOR. Good references.—Address, X. Y., Post Office, Sloane Street, S.W.

HYDROPATHY.—SUDBROOK PARK, Richmond Hill. *Physician*—Dr. EDWARD LANE, M.A., M.D. Edin. Turkish Baths. Consultations daily (Saturday excepted) at 7 Princes Street, Hanover Square, from Ten till Twelve.

CLERICAL, MEDICAL, and GENERAL LIFE ASSURANCE SOCIETY.

Established 1824.

Directors.

Chairman—The Right Hon. JOHN ROBERT MOWBRAY, M.P., D.C.L.

Deputy-Chairmen.

WILLIAM BOWMAN, Esq., F.R.S.
Sir CHARLES LOCOCK, Bart., D.C.L., F.R.S.

Jas. M. Arnott, Esq., F.R.S.	Gerard W. Lydekker, Esq., M.A.
Lionel S. Beale, M.B., F.R.S.	Rev. Richd. Michell, D.D.
Patrick Black, M.D.	The Viscount Midleton.
Charles M. Deane, Esq.	Sir Jas. Paget, Bt., D.C.L., F.R.S.
Arthur Farre, M.D., F.R.S.	George H. Pinckard, Esq.
Professor Humphry, M.D., F.R.S.	Thomas Pridgin Teale, M.B.
Rev. John Edwd. Kempe, M.A.	Sir Fredk. M. Williams, Bt., M.P.

Actuary and Secretary—GEORGE CUTCLIFFE, Esq.

Assistant Actuary—BENJAMIN NEWBATT, Esq.

FINANCIAL RESULTS.

The Annual Income, steadily increasing, exceeds £267,000
The Assurance Fund, safely invested, is over £1,810,000
The New Policies in the last year were 515, assuring £275,740
The New Annual Premiums were £9,951
The Total Claims by Death paid amount to £3,028,929
The Subsisting Assurances and Bonuses amount to £5,733,799

DISTINCTIVE FEATURES.

CREDIT SYSTEM.—On any Policy for the whole duration of a healthy Life, where the age does not exceed 60, one half of the Annual Premiums during the first five years may remain on credit.

ENDOWMENT ASSURANCES may be effected, without Profits, by which the Sum Assured becomes payable on the attainment of a specified age, or at death, whichever event shall first happen.

INVALID LIVES may be assured at rates proportioned to the increased risk.

PROMPT SETTLEMENT OF CLAIMS.—Claims paid thirty days after proof of death.

BONUS.

The Reversionary Bonus at the Quinquennial Division in January, 1872 (amounting to £331,971) averaged 49 per Cent., and the Cash Bonus 25 per Cent. on the Premiums paid in the five years.

The next Division of Profits will take place in January, 1877, and Persons who effect New Policies before the end of June next will be entitled at that Division to one year's additional share of Profits over later Entrants.

REPORT, 1872.

The Annual Report just issued, and the Balance Sheets for the year ending June 30, 1872, as rendered to the Board of Trade, can be obtained of any of the Society's Agents, or of

GEORGE CUTCLIFFE, *Actuary and Secretary*,
13 St. James's Square, London, S.W.

LOSS of LIFE or LIMB, with the CONSEQUENT
LOSS of TIME and MONEY CAUSED by
ACCIDENTS of ALL KINDS, PROVIDED for by a POLICY of the
RAILWAY PASSENGERS' ASSURANCE COMPANY.
ESTABLISHED 1849.
CAPITAL ONE MILLION, FULLY SUBSCRIBED,
OFFERS UNDOUBTED SECURITY.
INVESTED CAPITAL and RESERVE FUND, £130,000.
AN ANNUAL PAYMENT of £3 to £6 5s. INSURES £1,000 at DEATH,
OR an ALLOWANCE at the RATE of £6 PER WEEK for TOTAL DISABLEMENT by INJURY.
INSURERS of FIVE YEARS' STANDING
SHARE in REALIZED PROFITS.
MARINE ASSURANCE AGAINST LOSS of LIFE at SEA.
INSURANCE AGAINST RAILWAY ACCIDENTS ALONE,
BY the JOURNEY or by PERIODS of TIME,
AT ALL RAILWAY STATIONS.
ASK for an INSURANCE TICKET WHEN YOU PAY YOUR RAILWAY FARE.
ANNUAL INCOME, £150,000.
SEVEN HUNDRED and TWENTY-FIVE THOUSAND POUNDS have been PAID as COMPENSATION,
FOR 37,500 CLAIMS from ACCIDENTS of EVERY DESCRIPTION,
WALKING, RIDING, DRIVING, HUNTING,
SHOOTING, FISHING, TRAVELLING, or at HOME.
PROMPT and LIBERAL SETTLEMENT of CLAIMS.
FOR TERMS and CONDITIONS,
APPLY to the CLERKS at the RAILWAY STATIONS,
TO the LOCAL AGENTS,
OR at the OFFICES,
NO 64 CORNHILL, and 10 REGENT STREET.
WILLIAM J. VIAN, SECRETARY.

IMPERIAL FIRE INSURANCE COMPANY.
Established 1803.
1 OLD BROAD STREET, E.C., and 16 and 17 PALL MALL, S.W.
CAPITAL, £1,500,000. PAID UP AND INVESTED, £700,000.
JAMES HOLLAND, *Superintendent.*

THE AGRA BANK, Limited.—Established in 1833.
CAPITAL, £1,000,000.
HEAD OFFICE—NICHOLAS LANE, LOMBARD STREET, LONDON.
BRANCHES in Edinburgh, Calcutta, Bombay, Madras, Kurrachee, Agra, Lahore, Shanghai, Hong Kong.

Current Accounts are kept at the Head Office on the Terms customary with London Bankers, and Interest allowed when the Credit Balances does not fall below £100.
Deposits received for fixed periods on the following terms, viz.:
At 5 per cent. per ann., subject to 12 months' Notice of Withdrawal.
For shorter periods Deposits will be received on terms to be agreed upon.

Bills issued at the current exchange of the day on any of the Branches of the Bank, free of extra charge; and Approved Bills purchased or sent for collection.
Sales and Purchases effected in British and Foreign Securities, in East India Stock and Loans, and the safe custody of the same undertaken.
Interest drawn, and Army, Navy, and Civil Pay and Pensions realised.
Every other description of Banking Business and Money Agency, British and Indian, transacted.

J. THOMSON, *Chairman.*

PHŒNIX FIRE OFFICE,
LOMBARD STREET AND CHARING CROSS, LONDON.—ESTABLISHED 1782.
Prompt and liberal Loss Settlements.
Insurances effected in all parts of the World.
GEO. W. LOVELL, *Secretary.*

EAGLE INSURANCE COMPANY.
Established 1807. (For Lives only.)
79 PALL MALL, LONDON.

Income from Premiums	£346,279
" from Interest	130,629
Accumulated Funds	2,190,699

Also, a Subscribed Capital of more than £1,500,000. The Expenses of Management are under 3 per cent.

At the Quinquennial Investigation in August last, the Sum of £181,454 was set aside for distribution amongst the Share and Policy-holders, an ample reserve having been previously made to meet all future Claims and provide for Bonuses, Expenses, and other contingencies.

GEORGE HUMPHREYS, *Actuary and Secretary.*

WINTER SEASON.—GRANVILLE HOTEL, St. Lawrence-on-Sea, Thanet.—During the Winter Months a Reduction of 25 per cent. will be made upon Apartments taken by the Week. Board, £3 3s. per week; Apartments according to size and position; Attendance, 1s. a day. Hydropathic, Turkish, or one and every description of Baths in the Hotel. Table-d'hôte at 6.30 P.M.

BRIGHTON.—BEDFORD HOTEL.—Every endeavour is made to render this Hotel equal to its long-existing repute. Spacious Coffee Room for Ladies and Gentlemen. Sea-Water Service in the Hotel.—Communications to The MANAGER, Bedford Hotel Company, Limited.

E. DENT & CO., 61 Strand, W.C., and 34 Royal Exchange, E.C., Manufacturers of CHRONOMETERS, WATCHES, ASTRONOMICAL, HOUSE and TURRET CLOCKS, to Her Majesty, and H.R.H. the Prince of Wales; Makers of the Great Clock of the Houses of Parliament, and of the New Standard Clock of the Royal Observatory, Greenwich. Catalogues on application.
E. DENT & CO., 61 Strand, 34 and 35 Royal Exchange (adjoining Lloyd's), and the Factory, Savoy Street, Strand, London.

FENDERS, STOVES, KITCHEN RANGES, FIRE-IRONS, and CHIMNEY-PIECES.—Buyers of the above are requested, before finally deciding, to visit the SHOW-ROOMS. They contain such an assortment of Fenders, Stoves, Ranges, Chimney-pieces, Fire-irons, and General Ironmongery as cannot be approached elsewhere, either for variety, novelty, beauty of design, or exquisiteness of workmanship, or price.

Black Register Stoves	from	9s. 9d. to £7 5s.
Bright Stoves, with Ormolu Ornaments	from	£3 13s. to £34 10s.
Bronzed Fenders	from	4s. to £5 12s.
Steel and Ormolu Fenders	from	£2 17s. to £25.
Chimney-pieces	from	£1 19s. to £169.
Fire-irons (Set of Three)	from	4s. to £5 10s.

COAL SCOOPS.—WILLIAM S. BURTON has 400 different Patterns of COAL SCOOPS on SHOW, of which he invites inspection. The Prices vary from 2s. 4d. to 14s. Plain Black open Scoops, from 2s. 4d.; do. do., fine-lined, from 3s. 3d.; covered Box Scoops, from 6s.; ditto, with Hand-Scoop, from 12s. 6d.; do. do., with fancy ornamentation, from 14s.; highly finished and ornamented, and inlaid with Imitation Ivory handles, from 25s. to 50s. There is also a choice selection of Wooden Coal Boxes, with iron and brass mountings.

WILLIAM S. BURTON, General Furnishing Ironmonger, by appointment, to H.R.H. the Prince of Wales, sends a CATALOGUE, containing upwards of 850 Illustrations of his unrivalled Stock, with List of Prices and Plans of the 30 large Show-rooms post free.—39 Oxford Street, W.; 1, 1A, 2, 3 and 4 Newman Street; 4, 5 and 6 Perry's Place; and 1 Newman Yard, London, W. The Cost of delivering Goods to the most distant parts of the United Kingdom by Railway is trifling. WILLIAM S. BURTON will always undertake delivery at a small fixed rate.

WANTED to PURCHASE some OLD ARTIFICIAL TEETH.—Persons having the above to SELL can forward them by post or otherwise, and their value will be sent per return.—Address, Mr. E. BROWNING, Dentist, 5 Chilworth Street, Paddington, London.

STAINED GLASS WINDOWS and CHURCH DECORATIONS.—HEATON, BUTLER, & BAYNE, Garrick Street, Covent Garden, London. Prize Medal, London and Paris.

PARQUET FURNITURE.—HOWARD'S PATENT.—Furniture of all descriptions made of HOWARD'S PATENT PARQUET is of the most durable kind, and (being manufactured by Machinery) moderate in cost; the workmanship is, notwithstanding, of the finest possible quality. Combining Parqueterie with Wood Tapestry, residences may be fitted up without either painting or paper hanging.

HOWARD & SONS,
Decorators and Cabinet Makers by Steam Power, 25, 26, and 27 Berners Street, London, W.

TREES, SHRUBS, &c.—The HEATHERSIDE COLLECTIONS, forming together, for £21, a complete Arboretum, equal in variety to some of the finest in Europe.

THOMAS THORNTON, Heatherside Nurseries, Bagshot, Surrey, offers a Collection of all the FINEST and NEWEST HARDY TREES and SHRUBS HITHERTO INTRODUCED, in Seven Series of 50 Species each, one Plant to each Species, viz.:—

No. 1.—50 distinct species of Conifers, including the best and newest		for	£3 5
2.—50	"	"	Evergreen Trees and Shrubs (not Conifers)	"	3 5
3.—50	"	"	tall Deciduous Trees, first sorts	"	2 0
4.—50	"	"	flowering and fine-foliaged Shrubs	"	1 10
5.—50	"	"	climbing and trailing Plants	"	2 4
6.—50 named varieties of Rhododendrons, including the finest and newest		"	6 10
7.—50	"	"	Fruit Trees of various sorts	"	3 5
Each Collection may be had separately, or the whole for			£21 0

When more than one of each species in a Collection is taken, a corresponding reduction will be made in price.
The Plants sent will range from 1 to 7 feet in height.
The Plants will be carefully packed (without charge), and will be delivered (free) at either the Farnborough, Blackwater, or Sunninghill Stations.
Terms—Net Cash on or before delivery. Unknown Correspondents will please accompany their orders by a remittance. Post-office orders payable at the Bagshot office. Cheques crossed London and County Bank, to the Aldershot Branch of which Bank T. THORNTON begs to refer as to his Pecuniary Status.

CLARK'S PATENT STEEL NOISELESS SHUTTERS, Self-Coiling, Fire and Thief Proof, can be adapted to any Window or other Opening. Prospectuses free.—CLARK & CO., Sole Patentees, Rathbone Place, W.; Paris, Manchester, Liverpool, and Dublin.

COLD CREAM of ROSES, In Jars, 1s.
PIESSE & LUBIN prepare this exquisite Cosmetic with the greatest care, fresh daily. Cold Cream Soap, free from alkali, 2s. per lb. Sold by all fashionable Druggists and Perfumers. Ask for PIESSE & LUBIN'S manufactures to prevent disappointment.—Laboratory of Flowers, 2 New Bond Street, London.

IRON WINE BINS.—FARROW & JACKSON (Business established 1798). First Wrought-Iron Wine Bins, invented and made by the late Mr. Farrow in 1824. First Wine Bins, with separate rest for each bottle, registered by present firm March 1, 1861. The new Exhibit Bins, also with separate rest for each bottle (but so arranged that the necks of the bottles are outwards, an advantage peculiar to this form of Wine Bin), registered by them March 28, 1872.—19 Great Tower Street, 8 Haymarket, 91 Mansell Street, London; and 23 Rue du Pont Neuf, Paris.

SALT & CO.'S EAST INDIA PALE and BURTON ALES, in Bottle, also in Cask, in the finest Condition. CHAMPAGNE—Rouzy, 44s.; Carte Blanche, 34s.; Sillery, 24s. per dozen. PORT—Cockburn's Old Crusted, 48s., 36s., 30s.; Draught, 24s. per dozen. SHERRY—S. Fino, 30s.; Fino, 24s.; Pale or Gold, 24s. per dozen. CLARET—Good, 12s.; Superior, 15s., 18s., 21s. per dozen.—MOODY & CO., 10 Lime Street, London, E.C.

SATURDAY REVIEW

OF

POLITICS, LITERATURE, SCIENCE, AND ART.

No. 900, Vol. 35. January 25, 1873. [Registered for Transmission abroad.] Price 6*d*.

GENERAL GRANT'S FOREIGN POLICY.

AN amiable writer in the *Kreuz Zeitung* includes in a long catalogue of affronts supposed to have been offered to England the cession to Germany of Delagoa Bay, which the Portuguese have not ceded, and the lease or sale by an impudent adventurer called BAEZ of the bay and harbour of Samana to an American Joint-Stock Company. It is still extremely doubtful whether the Senate will allow the PRESIDENT to accomplish his favourite project of annexing San Domingo; but a protest or expression of alarm on the part of England would insure popular support to any scheme of aggression. The Joint-Stock Company is evidently a mere fiction, or a temporary instrument of the PRESIDENT. The American Government would never recognize the sovereignty of an irresponsible body of private persons over any territory in the Western hemisphere. The peninsula which is the subject of the alleged conveyance is smaller than the Isle of Wight, but the harbour is the principal outlet for the trade of the Spanish part of the island. South American Presidents have seldom been remarkable for scrupulous regard to the constitutional limits of their power; but BAEZ surpasses all competitors in audacity when he sells to foreigners the absolute sovereignty over an indispensable portion of the national territory. It appears that he has a complaisant Senate which will share in the plunder, if the bargain is concluded by the American Government. The treaty, as it is called, can scarcely be worth the paper or parchment on which it is written. No body of speculators can either make a treaty or acquire by purchase the right to exercise jurisdiction over foreigners resident on their property. An American Republic of Samana would be simply ridiculous; nor can there be any reason for going through an idle form if the Senate of the United States is disposed to reverse its former policy, and if the House of Representatives is willing to vote the amount which BAEZ is to receive as a bribe. It is evident that the rest of the territory and the Dominican Republic must follow the fortunes of Samana, and that Hayti must be annexed in its turn. There is no reason why England should concern itself about the negotiation. Both the Spanish and the French population of the island would probably be better governed by American officers than by half-civilized rulers of the type of BAEZ. It was assuredly not out of deference to England, and probably not from any excessive regard to the rights of negro or mulatto Republics, that the Senate overruled General GRANT's policy of annexation. It is possible that the American Union may eventually surround itself with dependencies; but prudent politicians hesitate to commence without urgent reason a series of experiments which might seriously affect the Constitution of the Republic. Even after the admission of PINCHBECK, the appearance of BAEZ at Washington as a Senator of the United States from San Domingo would scarcely be regarded with equanimity. Inferior races included in the dominion of the Union must either be allowed to share in government and legislation, or be ruled by an authority which has yet to be created. For purposes of commerce it is wholly unnecessary to buy or to rent either the harbour of Samana or the territory of San Domingo; but if the people of the United States really desire to found a colonial empire, they will approve of the treasonable corruption of BAEZ.

The bargain concluded by the anonymous Company furnishes an excuse, if not a justification, for some of the charges which Mr. SUMNER urged against General GRANT in his elaborate speech delivered in the last Session of Congress. There is undoubtedly reason to suspect that the PRESIDENT has determined on pursuing a policy of aggression in several different quarters. He has despatched a general officer who enjoys his confidence to superintend the proceedings of the Sandwich Islanders; and the journals which support his Government are careful to proclaim that the mission of the Pacific fleet to Honolulu is intended for the purpose of counteracting English influence. Not two months have passed since General GRANT announced in his Message to Congress that not a cloud any longer hung over the relations of England and the United States; but the temptation of an appeal to popular prejudice which may perhaps remove the objection to annexation at once prevails over the friendly disposition which had been professed. It is not improbable that the Senate may resent the practice of employing military officers on informal diplomatic missions. General SCHOFIELD represents at Honolulu the PRESIDENT alone, although an accredited American Minister holds a commission which must have been confirmed by the Senate. It is not a little remarkable that the peaceable professions of the Message should have been immediately afterwards interpreted by the underhand transaction with BAEZ, and by the despatch of the squadron to the Sandwich Islands. It now appears that the journals which foretold the adoption of a bolder foreign policy after the re-election of General GRANT enjoyed a confidence which the PRESIDENT withheld from the Senate and the House of Representatives. It is difficult for foreigners to ascertain whether any sudden change has affected public opinion in the United States. It will be strange if Congress votes the money which will be required to fulfil the engagements of the Samana Company with BAEZ, after refusing to provide for the purchase of St. Thomas from the Government of Denmark. The acquisition of the Sandwich Islands is more likely to meet with general approval; but the unauthorised action of the PRESIDENT will scarcely fail to provoke jealousy and censure.

Of all the unexpected indications of an ambitious policy, the most surprising is the calculated menace which has been addressed to Spain. The indirect form of the communication aggravates the insult, as it implies that Mr. FISH was not even disposed to allow the Spanish Government an opportunity of complying with his demands. When the despatch was published at Washington, Mr. FISH must have been fully aware that it had not been presented by General SICKLES to the Spanish MINISTER for FOREIGN AFFAIRS; yet the despatch itself contained a formal order to communicate without delay either the text or the substance of the document. Señor ZORRILLA had shortly before been attacked in the Cortes on the ground of his alleged subserviency to American dictation; and by publishing the despatch Mr. FISH supplied a formidable weapon to the Opposition which is engaged in the task of maintaining slavery in Porto Rico. If the Emancipation Bill is rejected, and the Government consequently driven from office, the American SECRETARY of STATE will have once more an opportunity of denouncing the existence of slavery in Cuba. The inability to tolerate for a few years longer the continuance in a foreign State of a system which was abolished less than ten years ago in the United States is the more significant because General GRANT was before the Civil War not an opponent of slavery. It is remarkable that zeal for abolition should prompt the adoption of a policy of aggression which is elsewhere simultaneously pursued on entirely different grounds. There are no slaves in San Domingo or in the Sandwich Islands; and, on the other hand, there has in Cuba been neither the extinction of a dynasty nor a lease of a part of the island in full sovereignty to a Company of American shareholders. The proverbial five reasons for drinking were consistent with one another in comparison with the PRESIDENT's three reasons for annexing as many insular territories in the Atlantic and the Pacific.

Foreign politicians who happen to dislike England will probably have many opportunities of congratulating themselves on practical proofs that Russia, or the United States,

or perhaps the German Empire itself, entertain ambitious designs. It is perfectly true that the English Government and nation have no means of interposing a veto on the aggrandizement of great Powers as long as it is not effected at the expense of England; nor is it a cause for regret that such a transaction as the purchase of Samana affords no reason or pretext for interference with the policy of the United States. It was a King of Prussia, and not an English Minister, who declared that, if he were King of France, not a gun should be fired in Europe without his permission. Many guns may and will hereafter be fired in the four quarters of the world without the permission of England; but it is not altogether obvious that each separate explosion will be especially offensive to one neutral and peaceable Power. The annexation of Savoy and Nice was probably as unacceptable to Prussia as to England, and the encroachments of Russia on the nominal independence of Poland were distasteful to the Western Powers; but it has not been generally held that in either case it would have been prudent to resort to hostile proceedings. The French nation, under the influence of thoughtless and prejudiced writers and orators, thought fit a few years ago to regard the progress of German unity as an injury to itself. To avoid taunts of the same kind which are now directed against England, the Imperial Government plunged into the disastrous war which overthrew the dynasty. Before the Government and Parliament of England will be induced to follow the example of France, the irony and invective of German journalists must become more pointed and more effective than at present.

POLITICS AT BIRMINGHAM.

POLITICIANS of all parties will be glad to learn from Mr. BRIGHT'S letter excusing his absence from a meeting of his constituents at Birmingham, that this, he hopes, will be the last occasion on which he will have to solicit their indulgence. His health is so far restored that he may be expected to take some part in the deliberations of Parliament next Session, and to give before long to the electors of Birmingham and to the country the benefit of knowing what he really thinks on the important subjects which he announces as ripe for discussion. The principal topics to which he adverts are the reduction of expenditure, the "land question," and the alteration of the county franchise. Mr. BRIGHT is in a different position from that occupied by most Liberal members, and especially from that occupied by his colleagues at Birmingham. He is aware that the country wants something more than vague phrases about extravagance, and landlordism, and suffering labourers. It wants clear practical propositions, based on arguments that will bear discussion, even if discussion shows them to be untenable. More particularly Mr. BRIGHT must be supposed to know what the land question is; for he speaks as if it had a clear meaning to his mind, and it has been in a great measure in consequence of his publication of an old letter from Mr. COBDEN that the notion has come to be suddenly and rapidly entertained that to deal with this question satisfactorily must be part of the accepted Liberal programme. He also says in his recent letter to his Birmingham friends that the more this question is discussed by the public the more Parliament will be prepared to deal with it. This is of course true, and if Parliament is to deal with it, it is most desirable that the public should know something about it. The present Parliament is not, according to Mr. BRIGHT, fit to deal with it. The question is one too big for an expiring Parliament, and although Mr. BRIGHT expects that the present Parliament will sit for nearly two years more, yet its energies are already so exhausted that it is incompetent to deal with great questions. There will therefore be plenty of time to discuss the land question, and as it is such a very big question, and wants such a very vigorous Parliament to deal with it, the sooner discussion is started the better. If Mr. BRIGHT would but let his Liberal friends know what the land question is, they would be happy to take his views upon it, and swear to stand or fall in their defence. But what is the ordinary Liberal member, or what is the public, to do while the secret of what this question is remains so obscure? No light comes from any quarter. Supposing that a general system of registration of ownership and incumbrances of land were effected throughout the kingdom, and that conveyancing were made simplicity itself; supposing also that the law of intestate succession to land were made the same as that relating to personalty; and supposing, further, that trespass laws of great stringency were substituted for the Game-laws, would the land question be settled, or only partially settled, or not touched at all? We have not the slightest notion how to answer this, and it is quite evident that not a single Liberal member who has lately referred mysteriously to the land question in his speeches to his constituents has any notion. The land question cannot be discussed until there is something to discuss, and we should most sincerely welcome an exposition from Mr. BRIGHT of what the land question is, so that the discussion might be started, and those who are to sit in the next Parliament might begin to prepare for their gigantic mission.

The alteration of the county franchise is the other great question of the future which Mr. BRIGHT regards as too big for this Parliament, and destined to be relegated to its successor. This at least is intelligible enough. The proposal is that every householder should have a vote throughout the country, and, as much of the distinction between the rural and urban population would be thus done away with, a further proposal is arrived at without much difficulty, that there should be equal electoral districts. Why should agricultural labourers have votes? This is a preliminary question which is well worth considering, but which is almost completely ignored by those who speak on the subject. There need be no prejudice on the subject, no indisposition to do justice to the labourer, no sneering at democracy. We may ask the question, not as settling it virtually by raising it, and creating an anticipation that the answer must be that there is no reason, but quite dispassionately, Why should the agricultural labourer have a vote? The answers we gather from reading the speeches of Liberal members may be grouped under three heads. In the first place, it is said that they ought to have votes because they are undoubtedly going to have votes; and there is much force in this, if the fact be so. Discussion as to the propriety of giving labourers votes is at an end when once the bestowal of these votes is looked on as a mere question of party politics. The Liberals are sure to propose the change, and the Conservatives will, it is assumed, neither have the courage nor the strength to resist it. This is the view taken by Mr. DIXON, who simply advises all parties to begin educating the agricultural population at once, for it seems that directly they get votes they will proceed to settle all questions relating to capital and labour and to taxation in a very bold manner; and, as Mr. DIXON justly says, it is desirable that they should, or, to speak more accurately, that their younger children should, know how to read very imperfectly before they take these matters in hand. Secondly, the question is sometimes answered by saying that the rural labourers have grievances, and that, if they have votes, they will get these grievances redressed, whereas they will not do so if they have not votes. Candidates would be obliged to consider what agricultural labourers would like to have enacted by Parliament if their election depends on these humble sufferers. Exactly the same argument is urged in favour of giving women the suffrage. If they had votes, women's wrongs would be attended to. It is certainly a great reproach to the existing Constitution, if the wrongs of agricultural labourers and women exist, if they are capable of removal by legislation, and are not redressed. But it would be necessary, in the first place, to know what these wrongs are, and, secondly, to know whether they are of so great an importance and intensity as to warrant a sweeping constitutional change. Lastly, the extension of the suffrage to agricultural labourers is very often defended on the ground that any one will do for an elector. The rural population are not, it is urged, much greater fools than the pothouse politicians of boroughs, and they are all our own flesh and blood, and so forth. This is the most undeniable ground that can be taken if its cardinal assumption is once accepted, that fitness to vote is not to be regarded in any way as part of the necessary qualification of an elector.

Mr. BRIGHT does not consider the reduction of national expenditure as part of the programme of a new Parliament, for he has got into a state of despair about it, and does not believe that any Ministry or any Parliament is likely to do what Mr. GLADSTONE'S Ministry and Mr. GLADSTONE'S Parliament have failed in doing. He has evidently come to the conclusion that he will not live to see the public expenditure much reduced. And perhaps he may before long admit the unwelcome conclusion that this is because no great reduction is possible. After the interest of the debt is paid, England spends in governing itself about fifteen millions, and in insuring itself against foreign enemies about twenty-five millions. Is this really a very extravagant outlay for so rich a nation, with its territory dispersed over the globe, and with prices so high as at present? Judging by the experience of other nations, it certainly is not. The nation no doubt could

spend less, but then it would not have the things that it wants. The real task of an economical Ministry is not to reduce expenditure so much as to prevent new means of spending money being forced on the Government by persons who think that they have only to dip in the public purse to get anything they fancy carried out. At this very meeting in Birmingham, which was opened by the reading of Mr. BRIGHT'S letter lamenting the irrepressible extravagance of the public expenditure, Mr. DIXON quietly proposed to devote five millions more to the expenditure on education. He does not like the present system of education; but to introduce the system of which he approves would be very costly, and, as local ratepayers would certainly not choose to raise the necessary funds, he finds the solution of his difficulty in asking for a further grant of five millions sterling from the Consolidated Fund. It is true that he, in an airy way, proposes to more than cover the increase by a reduction in the expenditure on the army and navy, but he does not condescend to show how that could be done. This is the sort of financial talk that is thought good enough for the platform of a meeting in one of the greatest towns in England, and in one of the strongholds of the party which is pledged to economy. Mr. BRIGHT, after reading his colleague's speech, must have been bitterly reminded of the real reasons why the public expenditure is always in danger of being carried beyond what it ought to be. Definite schemes of expenditure and indefinite projects of saving are as ruinous to nations as to private persons.

MONARCHICAL PRETENDERS.

WHEN the late EMPEROR died the most zealous adherents of his dynasty pointed out that France need not be alarmed lest there should not be a new Emperor ready for her as soon as she woke to the fact that she wanted one. The son of the EMPEROR will be eighteen next year, when all Sovereigns come of age by special prerogative, and the French territory, it was thought, would only just be cleared in time to give him a country in a decent state for him to reign over. In a year's time the Germans would have gone away, and the PRINCE IMPERIAL would be of age, and then would be exactly the proper time for a Restoration. But France is getting the stage ready for the various pretenders to the Throne almost too quickly to suit them. The payments received by the Treasury on account of the last loan have been so large that no doubt now exists as to the first four milliards being paid to the Germans by May of this year, and it has been said that the French Government was making arrangements to offer guarantees instead of the actual cash for the last milliard. But if the latest reports are correct, the financial position of France is so good that it will be able to find cash for the last milliard, and thus in a few months the indemnity will have been paid and the Germans will, it may be expected, leave France. The trial of Marshal BAZAINE, it may be observed, has been postponed for a time on the plea that it is not desirable that it should be held while the Germans are in France, and this also points to the expectation that it will not be very long before the country is cleared of the Germans. Then will come the crisis to which Frenchmen of all parties have been long looking forward with so much interest. Unless the Republic is to be definitively proclaimed as the established Government, some section of monarchists must then make good their pretensions. That there should be so many of them is very embarrassing, and certainly no one of them stands out sufficiently before all the rest to make it probable that he could have the slightest chance of success if he tried his fortune within the present year. The immediate chiefs of the Imperialist party seem to see quite clearly how very feeble is their prospect of a speedy restoration, and they have had the good sense to strive to curb the extravagant zeal of their subordinates in France by announcing that the PRINCE will wait very quietly under the joint guardianship of the EMPRESS and Prince NAPOLEON, and will not obtrude his pretensions on the world. Decency suggests that these two guardians of the young PRINCE should be supposed to be working in complete harmony, for the Bonapartists are not powerful enough to stand a split in their ranks; but that two persons so different in character and opinions could really agree if there was any chance of serious action is extremely improbable, and Imperialism before it gets one real Court is likely to have two mock ones.

Meanwhile all can for the present go on very comfortably. The EMPRESS and her boy are settled in England, and Prince NAPOLEON has a father-in-law who will always place a palace in Italy at his disposal. He wants to be treated as another Frenchman, and to be allowed to reside in France. Nor is there any pretext of legality for the refusal to let him come. Monarchical pretenders are not all treated on an equal footing in France, or judged by the same law. Although M. THIERS affects not to have prejudged the question against a new BOURBON King, he does not for a moment hesitate to avow that he has always endeavoured to make a new BONAPARTE Emperor impossible in his time. He has lately sought a conference with the Committee appointed to examine into the circumstances attending the expulsion of Prince NAPOLEON, and has frankly avowed that there was nothing particular in the conduct of the Prince to which he objected. He had no acts of conspiracy to allege; he merely thought that one of the BONAPARTE family would give trouble, would get noisy, meddlesome people about him, and be a centre of conspirators, if not a conspirator. As to the old plan of a NAPOLEON getting elected for some place like Corsica, and then coming forward in his sheep's clothing and professing regard for a Republic, M. THIERS thought that honest men had had enough of it, and were not such simpletons as to let the same trick be played on them twice. There is some truth in all this, and although he might not do much harm, yet Prince NAPOLEON, as a member of the National Assembly, and as offering a focus for the efforts of Imperialist intriguers, might give trouble and annoyance to the Government. But it is curious to contrast with the demeanour of the Government towards the BONAPARTE family the attitude which it assumes towards the BOURBONS. If the existing Government is supposed to be that of a Republic, it is threatened much more immediately by a BOURBON than by a BONAPARTE Restoration. Yet the ORLEANS Princes are members of the Assembly, and attend the Expiatory Mass in memory of a deceased head of their family in almost Royal state. They are restored to their property; they act as Presidents of different Societies and meetings. The Count of CHAMBORD is quite at liberty to come whenever he pleases to the deserted castle from which he borrows his name. It must be owned that this is a very strange state of things. Those who are most dangerous to the existence of the Republic are welcomed on the national territory; those who are only very slightly dangerous are carefully excluded from it. If the Republic is to be treated as merely provisional, then a chance is given to only one set of possible successors, and another set is rigidly kept away, so that France may not have a fair choice between them. There can be no doubt what M. THIERS really means. If he can, he will establish the Republic, or at any rate that very peculiar form of a Republic which consists in his being President, and having an Assembly to guide, enlighten, cajole, and baffle. If this is found impossible, France shall have a Monarchy; and he will take care that this Monarchy shall be a BOURBON Monarchy. If he cannot keep the prize himself, he will hand it over to his friends, and not to his enemies.

But it may be doubted whether this seeming advantage is really so beneficial to the BOURBONS as might be expected. Two years have nearly elapsed since France had to make peace and to entrust her destinies to an Assembly the majority of which was very favourable to a BOURBON Restoration, and probably only a few months have now to elapse before the decision of the nation on its form of government will be pronounced. With two-thirds of this period of their great opportunity gone by, the BOURBONS do not seem to get forward. There they are, conspicuous, powerful, venerated, but no one seems to want them very much or to care for them. They are divided among themselves, and in spite of the reports of a fusion that are constantly set on foot, the fusion is never effected. The Count of CHAMBORD and the Count of PARIS represent two different currents of thought which flow through the Royalist party; and although it seems a small mark of difference to say that the heads of the two branches of the family are irreconcilable because one wants a white flag and the other wants the tricolour, yet these flags are the symbols of entirely different conceptions of what a BOURBON Restoration means. If, having had this long time of exceptional favour and exceptional opportunities, the Royalists have been unable to get any further forward or to carry the country with them, they may soon come to be regarded, if they are not regarded already, as men who are played out, and from whom it has been ascertained that nothing effective can come. The Imperialists will then have the comparative advantage of having remained for a time in obscurity. But although this might re-awaken some interest in their proceedings, yet it could not do much for them so long as the Government went on from day to day upholding order and satisfying the national wants of the moment. No one of the monarchical parties in France is strong enough at once

to put down the others and to get a fair hold of the nation. All the monarchical parties of France strive to avoid the reproach of stirring up civil war, and repudiate the imputation that they could be induced to imitate the Spanish Carlists and seek to regain power by petty raids, or by military surprises such as those attempted with such bad success at Strasburg and Boulogne by the late EMPEROR. They all look patiently to France and await its decision; and a Conservative Republic is the name given to a form of Government the chief object of which is to keep them waiting. Whether such a state of things can last long enough for new habits to grow up, and for Frenchmen to feel the ties binding them to some monarchical party or another becoming gradually weaker, is a point on which scarcely any two Frenchmen appear to hold the same opinion on the same grounds.

LORD LYTTON.

THE death of Lord LYTTON is not of political importance. He had not held office in the last Conservative Administration; nor had he even spoken in the House of Lords. His votes had been those of a prudent and moderate Conservative; but he probably devoted little time or thought to public affairs. His early Liberalism and his later alliance with the party of resistance were probably results of sincere, but not of profound, conviction. It became an Englishman of letters, holding a good social position, to aspire, like a Roman patrician, to political distinction; and the faculties and studies which had enabled Sir EDWARD LYTTON to become a brilliant writer proved to be adequate to the attainment of considerable Parliamentary success. He was not born an orator; and it was only in his later years that he became celebrated for a polished and somewhat artificial eloquence. Not possessing the readiness of a debater, he confined his efforts to the preparation and delivery of set speeches, which commanded the intellectual appreciation of competent critics and the respect of the body of the House of Commons. His official fortunes bore some analogy to his Parliamentary career. Through the friendship of Mr. DISRAELI and the confidence of Lord DERBY he administered for a short time a great department of State, without having at any time served an apprenticeship in public business. The Colonial Office at that time attracted but little public attention; and Sir EDWARD LYTTON's principal achievements, if they had been noticed, would not have added to his fame. His literary instinct ought to have suggested to him a less awkward name for a colony than that of British Columbia; and he committed a much graver error in appointing Mr. GLADSTONE Lord High Commissioner Extraordinary of the Ionian Islands. The appointment was probably illegal, as it was certainly unconstitutional; and its principal result, after the collapse of a ridiculous project of democratic reform, was the abandonment of a Protectorate which Sir EDWARD LYTTON desired to maintain. The real object of the mission was probably to secure to the Conservatives the adherence of the versatile statesman who soon afterwards canvassed the county of Flint in the interest of Lord DERBY; but the merit of the intrigue which pleased the fancy of the veteran novelist could only have consisted in its success; and Mr. GLADSTONE's Ionian eccentricities have been followed by a final adoption of the party of movement.

If Lord LYTTON can scarcely be regarded as a statesman of serious pretensions, there can be no doubt that his experience as a politician and a man of the world added greatly to the value of his literary productions. His principal rivals happened not to have enjoyed the advantage of any familiarity with great affairs. Mr. THACKERAY, though he had much knowledge of social life, and although he once became a candidate for a seat in Parliament, cared so little for politics that in his hustings speeches he adopted, by mistake, some of the commonplaces of the wrong party. Mr. DICKENS, though he fancied himself a moral reformer, possessed not even a rudimentary acquaintance either with social traditions or with political theories. Lord LYTTON was familiar from his earliest youth with the contests of parties, which he probably always regarded with the dispassionate curiosity of an artist. The hero of *Pelham* displays his superiority to prejudice by a cynical indifference to political consistency; and all the statesmen who figure in Lord LYTTON's later novels are represented as aspirants to power, or as calm spectators of public events, rather than as enthusiasts for any political cause. It is true that an imaginative writer ought not to be identified with the fictitious personages whom he sets in motion; and Lord LYTTON deserves credit for not attempting to convert romances into political tracts; but in public life, as well as in literary composition, he either discarded or visibly overacted the character of partisan. The most popular of his political writings was published on the dismissal of the MELBOURNE Ministry by WILLIAM IV., when Lord ALTHORP was removed to the House of Lords. The proceeding of the KING was anomalous, and it produced much party indignation, which attracted attention to the protest of a clever pamphleteer; but any inquirer who thinks it worth while to disinter an obsolete document will find that the writer, instead of sharing the passions of his party, is chiefly concerned with the elaboration of antitheses and epigrams. He repeats again and again, with tiresome reiteration, the statement that a great change had arisen from a disproportionately petty cause, for that the enemies of reform had been summoned to office because a respectable old nobleman had died. That the KING had been only premature in regarding as complete the Conservative reaction which had only commenced, and that Sir ROBERT PEEL was greatly superior in administrative ability to his adversaries, were considerations which would have been rejected as irrelevant if they had occurred to the advocate who amused himself for the moment by assuming the demeanour of a zealous partisan.

In his literary character Lord LYTTON was more conscientious, because he was thoroughly in earnest. His industry as a writer was indefatigable; and it is now known that he was actively employed in composition when he had been supposed in his later years to have withdrawn from the field of literature. Trying almost every kind of composition, he succeeded in one not unimportant department. He was neither a humourist nor a philosopher, though he flattered himself that he possessed the qualities of both; and his powers of vivid dramatic impersonation were of a feeble order; but he surpassed all his contemporaries and many of his predecessors in the rare art of constructing a story; and he seems seldom to have yielded, like SCOTT and THACKERAY and DICKENS, to the temptation of changing his plan as his narrative proceeded. He fancied himself a poet; and by dint of incessant labour he produced some tolerable verses. He had also a laudable ambition to distinguish himself as a scholar; and his work on Athens may still be seen on dusty book-shelves. His plays display an aptitude for satisfying the conditions of success on the stage, though they possess but little literary merit. His fame must rest on his novels, which may perhaps remain popular for more than one generation. The adjectives which were converted by the use of the definite article into substantives, and then used as the signs of supposed thoughts, will long continue to raise a not unsympathetic smile; but the tales in which they are interspersed possess the mark of genius in the interest which they seldom fail to excite and gratify. The writer who sometimes endeavours to pass himself off as a dreamy theorist is really occupied in the epic function of ordering events which follow in a natural or credible succession. The touch of egotistic personality from which only the greatest writers are exempt is harmlessly indicated by the unfailing coincidence, during thirty or forty years, of the age of the hero with the age of the writer. In other branches of literature Lord LYTTON was a clever and graceful amateur. As a writer of novels he was a professional artist of extraordinary merit.

There was but little similarity between the two eminent romance writers who sat together in Lord DERBY's Cabinet of 1858. Mr. DISRAELI, though he has written brilliant novels, is primarily and principally a politician, while Sir EDWARD LYTTON only qualified himself to become a Minister by attaining high distinction as a man of letters. There is no probability that in England literary and political success will be more frequently combined in the future than in the past. In the majority of cases it is a loss to the world when a writer of genius deserts the career for which he is especially fit; but no general rule can be laid down for the union or separation of dissimilar employments. With the exceptions of the Duke of ARGYLL, who prefers science to literature, and of Mr. GLADSTONE, who is rather an accomplished scholar than a regular author, Mr. DISRAELI and Lord LYTTON are the only Ministers who in the present generation have cultivated literary aspirations. The circumstances of France during the last sixty years have been especially favourable to the political success of literary men, and several of them have attained the highest rank in the State; but M. GUIZOT and M. THIERS wrote on subjects immediately connected with modern politics; and more imaginative writers have conspicuously failed as statesmen. LAMARTINE was an eloquent charlatan who, having pledged himself to monarchy in the morning, and put himself at the head of a Republic

in the afternoon, was ignominiously driven from power by an Assembly which had been elected a few weeks before with the express mission of supporting him. VICTOR HUGO has proved the melancholy truth that a great poet may in mundane affairs become a pestilent quack. With fit opportunities BYRON would probably have attained high rank as an orator and politician; but his vigorous common sense was even more remarkable than his imaginative power, and he had little tendency to enthusiasm. Other English poets have not in modern times committed the blunder of deserting their proper vocation for a political career, although WORDSWORTH wrote two or three political pamphlets, and although COLERIDGE earned at one time a livelihood as a journalist. Lord LYTTON, who was not a poet, passed through the career of politics with credit and dignity; but he seems always to have understood that the proper business of his life was to write rather than to speak or to act. The news of his death has been received with universal regret.

MINISTERIAL RESPONSIBILITY IN FRANCE.

THE tendency of French political parties to effect unexpected changes of character among themselves has received a fresh illustration in the proceedings of the Committee of Thirty. Ever since the reading of M. THIERS's Message, the Right have been continually asserting that the present Government is only provisional. M. THIERS and the Republic alike hold office until—and only until—their successors are appointed. The Left has usually maintained, in opposition to this, that, however anomalous some of the incidents of the existing order of things may happen to be, the order itself is settled and permanent. The Republic may be somewhat naked in the matter of institutions, but it is not the less the legal Government of the country. In the debate in the Committee on the relations between the PRESIDENT and the Assembly these parts have been completely reversed. The Duke DECAZES has been seeking to apply the regular maxims of Parliamentary government to an arrangement which, from his point of view, is merely a temporary expedient for tiding over a difficulty. The minority in the Committee have been opposing him on the ground that such maxims are altogether inappropriate until France is in possession of a settled and organized Constitution. In last Monday's discussion the Committee began by agreeing that M. THIERS should communicate with the Assembly by message. It seems to have been admitted, however, on all hands that some exceptions must be made to this rule. That M. THIERS should be altogether shut out from the Assembly would in the present position of affairs be too great an absurdity to stand any chance of being adopted, or even proposed, in serious earnest. The controversy turned upon the extent of the exceptions. There was no objection to allowing him to address the Assembly in the course of a debate on a Bill. Bills are not ordinarily the occasion of a Ministerial crisis, and it is in a Ministerial crisis that the Right is chiefly anxious to shut M. THIERS's mouth. To meet this desire, the Duke DECAZES moved that the permission should be confined to debates on Bills, and should not extend to debates arising out of interpellations addressed to Ministers. M. LEFÈVRE-PONTALIS, who supported the Duke's amendment, founded his argument on the old theme of the ineffaceable distinction between the legislative and executive powers. He admitted that before M. THIERS became President this distinction was necessarily in abeyance. He had then no other title than Chief of the Executive and President of the Council of Ministers. He was directly responsible to the Assembly, and it was necessary therefore that he should be able to defend his acts from the tribune. But in naming M. THIERS President the Assembly has made him the Chief of the State. As such he can have no personal policy; he must take the policy marked out for him by the majority of the Assembly. If for a time it is necessary to concede to him the right of having and stating an opinion upon the merits of the laws which it proposed that the Assembly should enact, so exceptional a permission must be very strictly limited. To give him the right of intervening in debates on interpellations would be to allow him to identify himself with a particular Minister or set of Ministers. As President he has no business to do this. He holds a position above party contentions, and he ought to have no preference—at all events he ought to betray none—for one Ministry over another.

M. LEFÈVRE-PONTALIS has very well defined the position of a Constitutional King as the term is understood in England. And if M. THIERS had been elected President by the French people, it might have been wise to subject him to all the restrictions which are imposed in free countries on hereditary Sovereigns. But M. LEFÈVRE-PONTALIS leaves out of sight the important fact that M. THIERS has been elected by the French Legislature. The origin of his power is the same as in the case of an ordinary Prime Minister. He bears a title which has hitherto been applied to another kind of officer; but the power he wields is far more akin to that exercised by Mr. GLADSTONE than to that exercised by General GRANT. There is a meaning in the notion of a President elected by the people. He is placed at the head of affairs as a check upon the action of the Assembly. The executive equally with the legislative authority is derived directly from a popular vote, and if the two are not in accord there is no *primâ facie* reason for regarding one rather than the other as giving the right version of the popular will. But a President elected by the Legislature is only of value so long as he is in harmony with the Legislature. He has no other title to power than the Parliamentary vote which in the first instance placed him at the head of affairs; and when the confidence which inspired that vote is gone past renewal, it is only reasonable that he should resign his power to the hands of those who gave it him. He is a Minister in everything but the name, and the political current will run most smoothly when this substantial identity is most clearly recognized.

The minority which opposed the Duke DECAZES's proposal preferred, however, to rest their case upon the exceptional nature of M. THIERS's position. They did not challenge the theory of Ministerial responsibility, or of Presidential superiority to party politics. They only protested against upsetting the whole conduct of public business by an over-rigid adherence to constitutional technicalities. France cannot dispense with M. THIERS. He is as much a necessity as the Assembly. Is it not better that these two necessities should have free access to one another's views and enjoy every possible opportunity of coming to an agreement upon the business which they have to transact in common? The exclusion of M. THIERS from the tribune during the discussion of interpellations would not prevent conflicts between him and the Assembly. It would rather tend to make them more frequent and more serious. As it is, when the opinion of the majority of the Assembly is different from the PRESIDENT's, there is room for mutual explanations. If no opening is given for these, if the Assembly votes contrary to M. THIERS's wish without his having had an opportunity of expounding and justifying his policy, how can a breach between the Executive and the Legislature be possibly avoided? The Duke DECAZES would answer that, if the PRESIDENT realized his true position, no such breach could possibly occur. The censures of the Assembly would never reach so high as the PRESIDENT. The only crisis that could happen would be a Ministerial crisis. But the Duke forgets that the present Constitution of France rests upon a triangular contract. The Assembly may assign to M. THIERS the function of a Constitutional Sovereign, but if both the nation and M. THIERS refuse to execute the deed, what will be its practical value? It must be supposed that the majority of the Committee believe that they have an answer to this question ready; for an amendment, moved by the Duke DECAZES, has been adopted by nineteen votes to six. The latest attempt to find a middle term in which M. THIERS and the Committee can agree is M. BROD's proposal to give the PRESIDENT the right of speaking on interpellations which involve questions of general policy, foreign or domestic. If M. THIERS could be confined within these limits, it is very possible that the real object of the Committee would be gained. No advantage would accrue to the Right from silencing him when the duration of the German occupation, or the best mode of providing the next instalment of the indemnity, is under discussion. What is chiefly wanted is to prevent him from coming to the rescue of a Minister whom the Right are trying to turn out. But then comes in the difficulty, who is to say what constitutes a question of general policy. If it is to be M. THIERS, the definition may be stretched from time to time, until in the end it will be found to have included every subject upon which M. THIERS has cared to speak. To meet this M. BROD proposes that the Assembly, on the motion of a member of the Government, shall decide whether the interpellation has for its object a question of general politics. If M. THIERS assents to this compromise, it may be assumed that he counts upon the Assembly being induced, either by curiosity or by the desire not to seem afraid of his arguments, to give him leave to speak as often as he asks it. In this calculation he is probably right. To refuse to hear the PRESIDENT, when he has declared that the question is of sufficient importance to

make his speaking on it expedient, will saddle the Assembly with a graver responsibility than a fluctuating and timid majority will readily venture to incur.

In the meantime the Right in the Assembly have been furnishing a curious practical commentary on the meaning they attach to Ministerial responsibility. M. JULES SIMON, who is in bad odour with them, not so much for any actual offences as for the original sin of membership of the Government of National Defence, has lately put out a circular upon Secondary Education which is held to discourage the practice of Latin verse-making. Even the Extreme Right would hardly maintain that a Minister's views upon this question would be a sufficient cause for dismissing him. But they found a more plausible ground of censure in the fact that he had not consulted the Educational Council. As the Minister was willing to submit the circular to the Council before giving further effect to the revolutionary doctrine contained in it, this alleged illegality hardly amounted to a serious crime. But the Right, who had failed to beat M. SIMON in a previous debate on the constitution of this very Council, were determined not to throw away a chance. They pressed their motion to a division, and finding themselves beaten, they abstained from voting on a motion exonerating the Minister which was proposed immediately afterwards; and by this means ensured that the necessary quorum of members should not be present. The manœuvre was repeated on the following day, but not with the same success; and the result of the whole business seems to have been merely to strengthen the Government in the person of its weakest member. The most curious feature of the affair was M. BARAGNON'S indignant protest against the announcement of the MINISTER of the INTERIOR that the Government intended to make M. SIMON'S cause their own. The theory of the Right seems to be that the Assembly may dismiss every Minister in turn without expressing any want of confidence in the Ministry as a whole, and they hold themselves injured whenever the Government makes the Deputies understand that this innocent amusement may possibly have inconvenient consequences.

THE WELSH STRIKE.

ALTHOUGH it is scarcely probable that the South Wales strike can last for many weeks, no progress has hitherto been made to a settlement. The division which was taken at Blaina only expressed the opinions of two or three hundred out of ten thousand colliers; and it appears that the great majority disapproved of an appeal to the ballot. The promoters and supporters of the strike are perfectly consistent in opposing a proceeding which implies that the men are wavering in their purpose of resistance; and it is useless to reproach them with their distrust in their trade disputes of the contrivance which has, in accordance with their wish, been applied to Parliamentary elections. The managers of the Union, desiring in both cases to have their own way, can trust the mass of the workmen to vote for the popular candidate; while they are not certain that a majority would support the strike. The world is not in any department governed by the unbiassed opinion of majorities, but by combination and activity. It is still doubtful whether Trade Unions are on the whole beneficial to their members; but, if the experiment of their organization is to be fairly tried, the great mass of artisans must trust the managing body. An appeal to the ballot is in itself equivalent to a vote of want of confidence; and the colliers are not provided with an alternative government, to be formed by leaders of the opposition. It is not while their imaginations are excited by rumours of large remittances from the central Union that the workmen are likely to rebel against the Council. The tenth part of the weekly wages which were distributed a month ago is welcomed, not only as a seasonable contribution, but as a striking illustration of the vast resources of the Union. It is highly probable that the ironworkers will follow the example of the colliers by joining the Union of their trade as soon as work is resumed. Their helplessness during the present strike will suggest the expediency of making provision for future quarrels with their employers. That the accumulated hoards of years are in process of unprofitable dissipation is a consideration which will scarcely influence the decision of improvident workmen who have no savings on which they can fall back. Evil is almost always prolific of evil, and strikes tend to produce future strikes.

The proposals and statements of the masters have perhaps confirmed the erroneous impression of the workmen that their wages ought to bear a definite proportion to the profits of their employers. It is possible that at some future time collieries, ironworks, and other industrial undertakings may be conducted on principles of co-operation; but the South Wales capitalists have at present no intention of giving the workmen a share of their property; nor indeed do the promoters of the strike consciously or avowedly demand that the men should be taken into partnership. When the masters explain their notice of reduction of wages by a statement that prices have fallen, they countenance the theory that the workmen are directly interested in the rate of profit; yet they can in no case intend to pay more than the market price of the labour which they require. When their profits are large, it is their interest to increase their production; and consequently an additional demand for labour causes a rise of wages. The information which Mr. CRAWSHAY and other ironmasters have offered to the delegates of the workmen is either superfluous or incomplete. In the cost of production is included the value of the coal at the high price which it commands in the market, although the profit on the coal accrues to the same capitalist who complains that he is making iron at a loss. The workmen are not unnaturally puzzled and dissatisfied by a partial explanation which seems to admit the soundness of their own erroneous assumption. If the ironmasters were making fifty per cent. on their capital, they would not be bound to pay higher wages than in ordinary seasons, as long as they could obtain at a low rate the services of their workmen. If the business of postmasters and omnibus proprietors were extraordinarily flourishing, the price of horses might probably tend to rise; but it would not be voluntarily increased. The ironmasters and coalowners, in good times as in bad, buy their pit-wood and the materials of their plant at the cheapest possible rate; and their bargains with their workmen are really regulated by precisely similar considerations. The much-abused farmer has not been in the habit of lowering his wages in bad years; and he has not thought it necessary to raise them when his wheat or his wool was dear. Men of business for the most part correct any confusion of their theories when it becomes necessary to apply them in practice. The masters are willing to furnish certain information which is not strictly relevant to the dispute; but they resolutely decline an arbitration which could only proceed on a comparison of profits with wages. As it has been well remarked, they cannot compel their customers to refer to arbitration either the quantity of iron which they are to purchase or the price which they are to pay. Experiments which have from time to time been made by officiously benevolent Governments of attempts to fix the price of provisions or of other commodities have not been attended with success; nor would the South Wales workmen propose that the shopkeepers should supply them with goods on terms to be settled by arbitration. The allegation that the workmen might perhaps refuse to be bound by an award was one of the excuses which in all negotiations are substituted for the real objections to an unpalatable proceeding. The principle of arbitration is from the point of view of the masters wholly inadmissible; and the workmen, on the other hand, are contending for a share of the profits, although they have neither the ability nor the will to contribute to losses. The bulk of the community, who are interested only as consumers in the contests between employers and workmen, would probably suffer by any arbitrary adjustment of wages to profits. One of the chief causes of the great rise in the price of coal is the limitation of the supply by the colliers, who act under a vague impression that they will share in the advantage of high prices. A further advance in their wages would provide them with additional facilities for abstaining from work. The kind of partnership which they seek to establish with their owners will seldom tend to lower the cost of labour. In prosperous times the workman may claim to participate in increased profits, but the lower limit of wages will always be the amount which is necessary for subsistence for himself and his family. In trade disputes, as in all other controversies, impartiality is desirable, nor is it difficult to hold the balance even between masters and workmen; but there can be no indifferent bystanders in a struggle between the producers and the consumers of articles of the first necessity. An impulsive sentimentalist lately asserted that many rich inhabitants of London would rather have hanged the mutinous gas-stokers than have been deprived for a few days of the use of gas. The same feeble impetuosity would probably find vent in similar exaggerations of the general judgment which has been formed of the conduct of the South Wales colliers. It is perhaps true that disapproval of strikes may sometimes be produced by selfish motives, but a selfishness which is common to millions of consumers acquires a collective respectability.

The result of the South Wales strike might be confidently foretold if the final decision rested with the whole body of workmen; and the maintenance even of the colliers would exhaust, within a limited time, the funds or the patience of the Union. It now appears that the promoters of the strike were justified in their expectation that only a portion of the seceders would require assistance or support. Great numbers of the workmen have already found employment in the steam collieries; and some have probably migrated to more distant places. There appears to be no corresponding demand for the labour of the ironworkers, who are consequently in imminent danger of severe distress. As the demand for iron had previously slackened, the masters might bear with comparative equanimity the suspension of their industry if they were not threatened with foreign competition. The rapid succession of strikes in England will perhaps encourage production in other countries, and in some instances it may permanently transfer the superiority in cheapness or in quality to dangerous competitors. The American SECRETARY of the TREASURY lately alleged in his report to Congress that the progress of strikes in Europe would shortly render it unnecessary to foster American industry by protective duties. Struggles between masters and workmen have frequently and not inaccurately been described as wars; and belligerents have often found that the prize for which they had contended has passed into the possession of a neutral.

SCOTCH COUNTY ELECTIONS.

"PROGRESS under the direction of an educated minority," says the Bishop of MANCHESTER, in one of his Education Reports, "is just now the maximum desire of moderate-"minded Englishmen; progress under the majority, whether "educated or not, is the necessity of Americans." This was written six or seven years ago, and was true enough both of Englishmen and Scotchmen then. But in Scotland they have changed all that. The general election of 1868 has taken place since Dr. FRASER was in America, and the Ballot Act has passed since he became Bishop of MANCHESTER; and if he would think it worth while to direct his attention to the phases of Scotch political contests at the present moment, he would find that, whatever moderate-minded Englishmen may now desire, Scotchmen—at least the most Conservative of Scotchmen—have abandoned as idle or retrograde any notion of progress directed by minorities, and have been driven by force of circumstances into the "necessity of Americans." Henceforth the politics of the great Tory party in Scotland, if we may judge by the address of one of the candidates for Wigtownshire just published, and of which we shall speak more fully presently, are to be guided by the wishes of the masses in whose dictation the rank and file of the party are willing to acquiesce.

Three county elections have taken place within the last two months, and a fourth county seat is vacant. The proceedings in connexion with these seats are curious in a country where a Conservative reaction is proclaimed by the Conservative press almost every other day, and in the early prospect of a dissolution of Parliament they may warrant some detailed notice. There are now three estates in the Scotch political world—the Tories, the Whigs, and the Farmers. In the recent and pending elections these three have been and are engaged in a triangular struggle, in which, so far, the two former have rather had the worst of it. In one of the counties, Orkney and Shetland, the third class, being uninfluential and unsophisticated, did not come to the front. The election turned mainly on the qualifications or disqualifications of the candidates; and, as was natural in a county with few openings in life for enterprising men, the Chairman or Director of several Companies, with the patronage of small posts in his gift, was preferred to an Irish tailor from Limerick with a suspected leaning towards Home Rule and few or no appointments to give away to young Orcadians. But in the two other counties, Kincardine and Forfar, the Whigs and Tories have been driven from the field, and the farmers have triumphed. They are united, and under the Ballot Act are fearless; and they turned a deaf ear to every candidate who was not prepared to pledge himself to redress what they consider their grievances. A landed proprietor with local influence and popularity issued a Liberal address to the electors of Kincardine, and a Conservative of large possessions in the county and unbounded wealth went down to "prospect" the constituency. But the Conservative went straightway home again, and the Liberal could not secure a vote outside his own park gates. An Indian General, whose only claim upon the constituency rested on some connexion or relationship with JOSEPH HUME, came forward in the Radical interest, promised everything the farmers wanted, and was carried by acclamation. In Forfar a local Baronet (who was also an honours man at Oxford), backed by the Whig influence of the DALHOUSIE, PANMURE, and SOUTHESK estates, was early in the field proclaiming what at the last general election would have been considered advanced opinions. He canvassed the county, addressed meeting after meeting in the sanguine hope of securing a vote of confidence, advocating Young-Oxford Liberalism, offered to surrender his own opinions when they were opposed to those of the constituency, and to sit as their delegate, but it was all in vain. The hard-headed, horny-fisted farmers of Kincardine did not want a delegate. They considered Young-Oxford Liberalism to be crude and sentimental. They thought the candidate doubtful upon hares and rabbits, unsound on tenant right, and shifty on hypothec. They would have none of him, and now an orator from the town of Aberdeen represents, as an apostle of the farmers, the important county of Forfar, where till this year the territorial influence of the DALHOUSIE family was unshaken.

And while in the North political power has thus been surrendered to the new Third Estate, the prospects of the other two are even darker in the South. In the former case the Tory party were at least dignified and self-respecting. They abstained from intermeddling, and left the Whigs and farmers to fight it out. It is otherwise in Wigtown. In that county the struggle has hitherto been between the GALLOWAY influence on the Tory and the STAIR influence on the Liberal side. At the last election Lord GALLOWAY's eldest son, whose accession to the peerage creates the vacancy, defeated Sir ANDREW AGNEW, Lord STAIR's nominee, by a narrow majority. Now it is Lord STAIR's eldest son who comes forward, and his opponent is Lord GALLOWAY's nominee, a Mr. VANS AGNEW. Lord STAIR's son issued his address on the 11th of January, Mr. VANS AGNEW issued his upon the 15th. The former candidate promises to support the "great Liberal party," the latter to support the "great Conservative party." The Whig will help on Liberalism by abolishing the law of hypothec, surrendering hares and rabbits to the tenant, and securing to the tenants their unexhausted improvements. The Tory will help on Conservatism by securing to the tenants their unexhausted improvements, surrendering hares and rabbits, and abolishing the law of hypothec. And, in order that there may be no misunderstanding as to the thoroughness of his sentiments, he announces that, "as to changes, we must "follow the wishes of the community. All power really rests "with the masses, and ultimately their wishes must be carried "into effect." If the shades of the great DUNDASES, who, in the body, ruled Scotland not much more than half a century ago by hanging or transporting any of their countrymen who hazarded such opinions, take interest in the local politics of the present day, their minds must be strangely perplexed by the vagaries of their old party. The Tory candidate for the most exclusive county in Scotland abolishing the most sacred of territorial perquisites to gain a seat, and enunciating doctrines of tenant right and mob rule, is indeed a spectacle to move the spirits of the mighty dead. But the worst of it is, that it does not move the Wigtown farmer any more than Young-Oxford Radicalism moved the Forfar farmer. Since these addresses have been issued the farmers have held a meeting, and are not satisfied. *L'oppétit vient en mangeant*, and the Scotch farmers are still hungry. Their success in the North has emboldened them in the South. Rightly or wrongly, they look upon hypothec and ground-game as doomed. They expect a law to secure them in their improvements, and they are still asking for more. Their programme of the future comprises the abolition of all feudal restrictions affecting land; the abolition of the law of entail; destruction of deer forests, and limitation of flying game; and, finally, something not very defined in their own minds, but which has an affinity to permanent tenure of their lands. This last branch of the programme is fortunately still enshrouded in the fogs and mists of an indefinite purpose, and has not yet received articulate public expression. But its bearings are clear enough. High farming is such an expensive operation, the soil demands so much, fencing demands so much, labour is so extravagant, improved machinery is so costly, labourers require such good houses and so many comforts—all of which we farmers must supply—that leases are of little value to us. Nineteen years and a large expenditure of capital are requisite to get farms into order, and twenty-five or thirty to make them remunerative. It is our capital which improves the land, and it is the landlord who reaps the benefit. Nineteen years run out and we have had no return. At the expiration of our leases rents are raised twofold or threefold. If we get our

farms again, we pay the landlord a premium on the use of our own capital; and if we do not renew our lease at those high rates, we are turned out of the land in which our capital is sunk, and have to begin the whole thing over again with a diminished capital. It is cheaper to buy the land and pay mortgage interest, and it is the landlord must be made to sell. The farmer and proprietor must be one. The ideal state is one in which some fifty years hence farmers will become proprietors and proprietors will become farmers.

This, or something like it, is the Scotch farmers' dream of the future, and it would appear as if they hope, bit by bit, to make it a reality. At the last election three-fifths of the Scotch members went up pledged to support the farming interest. At the next election, if things move onwards at the present pace, no candidate will have a chance in a Scotch county who is not prepared to do the bidding of the farmers. Five years ago Mr. BRIGHT expressed his sorrow for the poor Scotch laird as the most unrepresented of mankind. But even he could hardly have foreseen such blank annihilation as is now foreshadowed. It really is full time that they should bestir themselves if they mean to retain even a semblance of political power. Whether they are going the right way about it or not in Wigtownshire is another question. It is not surprising that the son and heir of what is called a great Liberal family should come forward as the farmers' friend; and perhaps it is only by inducing such men as Lord DALRYMPLE to stand that the representation of Scotland can be saved from falling into the hands of stump orators and adventurers. It is another matter when a candidate comes forward to solicit the suffrages of the great Conservative party and offers to pledge himself to vote with the party led by Lord SALISBURY and the Bench of Bishops on general questions, and with the member for Leicester on Game-laws, and Mr. BRADLAUGH'S friends on land. Land transfer is no doubt a "Tory principle," but it is for that party to say whether they desire their principles to be carried out by forwarding the programme of the Land and Labour League.

MR. AYRTON'S RULES.

THE very clear, unanimous, and decided judgment of the Court of Queen's Bench on the appeal from a conviction by one of the police magistrates under the Parks Regulation Act should set at rest any doubts that may have been entertained as to the authority of the Crown over those domains. A few months ago a number of agitators thought fit to hold a public meeting in Hyde Park in order to express their contempt for the Government and to defy, or, as they called it, to test, the law. Their only reason for holding the meeting was that it was known to be a violation of certain rules which had been issued by the Ranger and the Board of Works under the Act of last Session. If there had been no rules to violate, they would have had no object in doing what they did. They took particular note of certain things which the rules posted at the gates of the Park forbade them to do, and deliberately did them. The pretext for the meeting, which was to get up a petition in favour of the Fenian prisoners, is of no consequence. It might have been held in a regular and legal manner, but the persons concerned resolved that everything they did should be in contravention of the law as laid down by the authorities. The police allowed the meeting to take place, but summoned the ringleaders before a magistrate, and one of them was convicted. It was an appeal against this conviction which the Judges of the Queen's Bench had to consider on Wednesday. The question was, whether the Ranger and the Chief Commissioner of Works had authority under the recent Act to enforce the rules with regard to the delivery of addresses and other matters. The Act contains a series of regulations as to certain things which are not to be permitted in any Park, except in accordance with the rules of the Park; and it authorises the Chief Commissioner, or in certain cases the Ranger, to make such rules as may be necessary. The Act further directs that these rules shall be forthwith laid before Parliament if Parliament is sitting, or, if not, then within three weeks after the beginning of the next Session; and gives power to either House of Parliament by a simple resolution to annul or alter any of the rules within a month after they are laid on the table. It was contended on the part of the appellant that the rules could not be enforced until they had been submitted to Parliament, but the Court held that the rules came into operation as soon as they were issued by the Ranger or Chief Commissioner, and that Parliament had power only to rescind them. Whatever may have been the intention of the authors of the Act, there can be no doubt that this is its plain and literal meaning. It is obvious that, if Parliament intended that the rules should not be operative without its assent, Parliament should have said so; as it did not say so, the Judges declined to assume the existence of an intention which was not expressed in the Act. The counsel for the appellant did not venture to suggest that the LORD CHIEF JUSTICE and his colleagues might discover the intention with which the Act was passed by an examination of the reports of the debates. The Judges have already quite enough to do in trying to understand Acts of Parliament, without attempting to understand the speeches of members. It was proposed, however, that the Court should consider whether the rules were reasonable; but the Court very properly refused to consider anything except whether they came within the scope of the statute.

Mr. GREENE, the counsel for the appellant, happened in the course of his argument to light upon an unfortunate phrase. He spoke of the common-law rights of the public to the use of the Parks, and the Judges were down on him directly. Mr. Justice BLACKBURN observed that, if the public had any rights at common law with regard to the Parks, he had never heard of them. He had always been under the impression that the public had only certain privileges, which were exercised on sufferance by leave and license of the Crown. The CHIEF JUSTICE and the other Judges took the same view. Mr. GREENE confessed he was "rather startled" to hear this opinion. He had always supposed that the Act itself recognized certain public rights, and only regulated the exercise of them; but Mr. Justice MELLOR explained that, on the contrary, the public had no rights until the rules were issued. Mr. Justice BLACKBURN added that the public never had any rights beyond the right to use the Parks in such manner as the Crown chose to permit. After some further discussion, it began to dawn on Mr. GREENE that the Court put the Crown in the position of a private owner, just as if the Parks were the property of private gentlemen, and he was obliged to confess that, after this surprising discovery, he could carry the argument no further. Mr. GREENE has evidently some rather confused ideas as to the nature of public rights. Another of the rights for which he contended was the right of rioters to be arrested by the police and marched off to the lock-up. He complained that the police did not interfere with his client when he was engaged in breaking the law; and Mr. Justice BLACKBURN had to ask whether this argument was really put forward seriously. As the counsel answered very frankly "No!" the Judge had to fall back on the assumption that it was a joke. It was not perhaps a bad joke in its way, though out of place at the moment. There is a *Comic History of Rome* and a *Comic History of England*, and we believe there is a *Comic Blackstone*. If there is not, here is a capital opening for Mr. GREENE; and one of his funniest chapters should be that on the common-law right of the subject to be taken up by the police when he misconducts himself.

In support of the supposed public right to the use of the Parks Mr. GREENE referred to usage. But what has been the usage of the Parks? For some two hundred years or thereabouts the Crown has exercised absolute authority over Hyde Park. It has made rules, has altered and repealed them; it has conferred privileges and withdrawn them. It has fixed the hours during which the Park shall be open, and decided what kind of traffic shall be admitted, and what people may, and what they may not, do in the Park. Once the Park was kept as an open common. Afterwards a wall was built round it; then the wall was pulled down, and railings were substituted. At one time fairs and races were allowed in the Park. Hackney carriages, which are now excluded, were formerly admitted. At the present moment, as anybody can see who chooses to walk that way, the use of the Park is regulated in the most peremptory manner. There are parts of the Park where people may drive, and parts where they may ride, and other parts are reserved for pedestrians. There is not even a right of way through the Park, and the Crown can shut and open the gates when it chooses. There is no common-law right to ride in Rotten Row any more than there is a common-law right to set up booths by the side of it, or to run races along the Ladies' Mile. The Crown, in the exercise of its proprietary authority, chooses to permit Rotten Row to be used for riding, and forbids fairs and races; but, if it chose, it could allow races and fairs as in other days, and turn Rotten Row into a flower garden. As Chief Justice COCKBURN said, whatever enjoyment of the Parks the public may have had has been entirely by the grace and favour of the Crown. In one sense the Crown is, no doubt, only another

name for Parliament, and the Parks may be described as public property. But that does not alter the fact that, as we have repeatedly pointed out, the authority of the officials who represent the Crown over the Parks corresponds precisely to the authority of any private owner. The public has no more right to hold a meeting in Hyde Park than in Knowle Park, or Blenheim, or Chatsworth. A meeting may be held if the proprietor chooses to allow it, but not otherwise. The mistake which pervades the whole of this foolish and discreditable agitation is that the right of the public to use the Parks in such a manner as the Crown or Parliament may choose to allow is confounded with a supposed right of the public to use the Parks exactly as it pleases. It is just as well that it should be understood that public property is not at the disposal of any members of the community for any purpose to which they may at any moment take it into their heads to apply it.

Mr. GLADSTONE unfortunately is not an authority recognized in Westminster Hall, or Mr. GREENE might have quoted him in support of his curious theory as to the common-law right of the public, or rather, to speak correctly, of a small and disorderly portion of the public, to override the authority of Parliament and the rights of the Crown. When Sir A. COCKBURN was one of the law officers of the Government he gave an opinion as to the authority of the Crown over the Parks, which was endorsed by two other eminent lawyers, and which was identical with that now laid down by the Court of Queen's Bench. Mr. GLADSTONE was a member of a Government which took steps to act upon this opinion in 1866, and we never heard that he remonstrated with his colleague, Sir GEORGE GREY, for the course he was prepared to pursue. But soon afterwards Mr. GLADSTONE found himself in Opposition; and when the Government of the day attempted to carry out the instructions which their predecessors had drawn up and left in the pigeon-holes of Downing Street, Mr. GLADSTONE discovered that the rights of the People were sacred, and not to be measured by legal precedents or opinions. The practice of using the Parks for other purposes than those of recreation and exercise is, as the CHIEF JUSTICE remarked, of modern growth, and has certainly been productive of something more than casual inconvenience. The meetings in the Park may not matter much, comparatively speaking, in themselves. They are, indeed, a serious nuisance, and some day they may lead to rioting and bloodshed. But after all that is a comparatively small part of the mischief connected with them. The great evil is the blow which has been struck at authority, and at the very principle of authority. From the first it was obvious that the meetings were utterly illegal. They were an invasion of the common-law rights of the Crown, and they were not sanctioned by any Parliamentary enactment. But at the time they served a party purpose, and were condoned. Mr. BRIGHT and Mr. GLADSTONE not only countenanced, but encouraged and invited, those breaches of the law; and one of the ringleaders has been promoted to the Bench. Whether meetings in the Parks are expedient or not, there can be only one opinion as to the pernicious consequences of the policy which has been pursued in regard to them. Grave misconceptions on the subject have been produced among ignorant and violent classes of the community, and everything has been done to weaken authority and to bring the law into contempt. Mr. AYRTON'S conduct with regard to the Park Rules appropriately closes a series of blunders which are almost criminal in their wantonness and imbecility.

THE UNIVERSITIES AND THE SCHOOLS.

IT is a distinction of our older English Universities that they have a life in themselves, and do not draw their vitality from the State; they neither take its money, nor do they get protection for their degrees in the way of exclusive privileges. Having thus an inherent life, they can shoot out in various directions, and they have accordingly instituted various kinds of examinations, some for youths and some for women, all over the country; not that it was their especial business to do so, but because they saw certain educational wants, and also saw that they could meet them. A foreign University has its duties laid down by the Government, and would no more think of stepping beyond them than the Home Office would think of busying itself with the Fine Arts. Indeed every Government department is usually on the look out to avoid having extra work thrown on it. "This is not our department" is their constant cry. But men or bodies who are doing their own work, and who are in earnest about it, are not so particular in mapping out the boundary of their duties, although they will be sensible enough to know that if they are too diffusive they will effect nothing. We welcome then these expansions of University action, as showing a healthy independent life; but we can well understand that persons at work in the Universities, without being obstructive, may think it right to warn these bodies that they have higher and more especial functions than that of superintending the secondary instruction of the country.

A German Professor, who, with his national habit, would look first to the interests of learning herself, while we in England look chiefly to the learners, would join in these notes of warning. He would, we think, gladly recognize in such extensions that "life in every limb" which he has been taught to look for in our English community, and the value of which, since France has shown the weakness of a dead mechanism worked by one huge engine, is getting more and more understood abroad. But he would say something like this:—"See that there is no danger of your leading people to forget that your proper function is liberal education and the higher learning only, that as a University you must be judged by your action on them, that all else is subsidiary. What seems to the mass more immediately useful, more bearing on 'bread and butter,' they will think ought to be the main concern with you. Do nothing to countenance this impression. Your first duty to England is to be the sanctuary of the highest cultivation, especially in those studies which are not pursued for gain. You have stood out against the thousand quackeries of the age, maintaining, what in Germany no one doubts, that to form is no less important than to fill. You have kept alive in the country a good standard of thoroughness and excellence. You will have to fight a battle to maintain this; for a despotism of mediocrity is threatening our civilization, and it will try to crush all greatness—intellectual eminence among the rest. Don't weaken yourselves by extending your front overmuch. With anything like technical education you have nothing whatever to do; technical skill meets with ready markets, and the market will create a supply for itself. No doubt you may properly see that those who are coming to you are well taught, and in so doing you may render some help to those who are going elsewhere; but do not let yourself be pulled off your own footing through holding out a helping hand."

Something like these oracular utterances would be heard from our Professor, and we should be inclined to think his warnings uncalled for, and savouring of the inveterate German way of looking at things "in the large"; but those who have had the patience to read the letters in the *Times* on the recent Conference of Head-Masters will find the generalities of our weird German friend translated into the particular and the palpable. Some of the schoolmasters seem to think that the Universities exist chiefly in order to provide a market for every kind of ware they fabricate. They are clamouring for "encouragement" from without for every item of common school instruction, as if they had lost the power of rewarding or stimulating their own boys. By "encouragement" they seem to mean that every single thing they teach should be made the subject of examination at the Responsions or the Littlego. Surely there are now Schools at Oxford and Triposes at Cambridge in every branch of learning which is fitted for examination; even an ordinary degree can be taken *viâ* chemistry, or history, or botany, or almost anything you please. But these examinations are too remote, they say, to act on boys at school; hence they call out—with "We are they who ought to speak" reverberating through all they say—for the introduction into the first University examination of all those subjects "without which no gentleman's education is complete."

Now, if one conclusion more than another has worked itself clear as regards the action of examinations, it is that a pass examination on this microcosm principle is mentally injurious. We even believe that this pulling many ways at once will be found to be both physiologically and psychologically destructive; and the only end answered by a multifarious course is that the teaching body may thrust its programme in the face of the public and say, "We teach all these things; if our pupils forget them it is their fault; we saw that they knew them once." If, to avoid diversity of subjects, you offer a great number of alternatives, then you destroy the unity of teaching, and bring about the evils which the masters very rightly complain of in the multiplicity of Entrance Examinations. Subjects may be of such a nature that, though excellent for education, they may be so ill suited for examination as even to lose a great part of their educational effect when they are studied with a compulsory examination in immediate view. A tutor and his pupils may read Shakspeare together with the greatest advantage, but as soon as the pupil is drawn into the whirlpool of an examination he will study nothing but the introductions, and the notes to the hard passages, and the study ceases to be beneficial. A knowledge of modern languages may be easily tested by examination, and it is proposed at Cambridge to admit this in place of Greek for candidates for honours; but these subjects are attended by this difficulty, when we would award distinction by means of them, that some of the candidates may be examined in what is practically their native tongue; it is remarked that the prizes at school in modern languages commonly fall to boys with foreign names.

Now the Universities have stored up a fund of experience in examining in a great variety of subjects; for there is hardly any kind of knowledge which is not made the matter of examination in the Local Examinations or for some University or College Scholarship; and its debates about examinations and their action are constantly going on, we may fairly suppose that the Universities are acquainted with their own speciality, and that they know what

they want to effect by their own examinations, and may be left to decide what is best for their own students. Moreover, we are told that one-third of the undergraduates do not come from schools at all, and the University in framing its system must not leave these out of consideration.

The Committee of Head-Masters, two years ago, laid before the Universities certain propositions; amongst other things they invited the Universities both to examine and *inspect* their schools. A Government inspection was threatened, and it was thought that an inspection by a Board organized by the Universities would be accepted by the Government. The Universities promptly took steps in the matter; conferences of Committees of the Universities with each other and with the Head-Masters were at once held, and the outline of a scheme has been drawn up. Some Masters object to it; nothing yet ever satisfied everybody. The pressure of the Government is now less felt. Mr. Lowe's pleasant proposition to subject our great schools to the hands of our Inspectors of National Schools, with regard to spelling and arithmetic, has died out of mind, and some of the Masters find particular objections to the particular form of action proposed. It seems to us that the question admits of solution on the simple principle that those who like it should adopt the proposal, and that those who do not should leave it alone. The controversy would have been somewhat technical and dry had not one or two scholastic gentlemen asserted their superiority to residents in the University generally, and shown how preposterous it was to suppose that they could submit to inspection at their hands. Scholastic communities in confined localities are prone to a self-complacency which our German friend would recognize as a variety of "Kleinstadterei." We rather gather from the tone of these writers that the only person whom they could trust to judge of themselves and of their work would be a being so rarely gifted that we doubt whether the Government or any other body could command his services. At the bottom of all their objection lies the question (not expressed), "Why should we be inspected at all?" and we are not indisposed to join in this question as far as concerns those of the first-grade schools which are most under the public eye. On the large schools public opinion acts freely; the Paterfamilias who has a complaint is only too well pleased to write to the *Times*, and marches out of his club a larger man in every dimension when he has seen himself in type, and feels that he is agitating society "unbeknown." It may be true that a boy who comes to a stationary position somewhere in the fifth form knows little in the classical and next to nothing in the modern department; but would any inspection remedy this? Possibly the classes may in some cases be too large; but the Masters are able, and work themselves to death. The evil lies in parental indulgence, in the all-importance of ease and amusement, which is impressed on the boys, not by word, but by the surer agency of doings, in every hour of their home life, and in the consequent current way of thinking and want of stamina among the boys. These defects originate with society rather than with the schools, and would not be removed by inspection. On the other hand, in many schools there is vigorous work going on throughout, every kind of material is made to receive all the polish it can take, and this kind of conscientious work would be best brought to light by a system of inspection—that is to say, by an inquiry into the state of each *class* in the school; for to test the condition of each *boy*, which is what some seem to understand by inspection, would be too costly in money and time. Moreover, even if the Government does not step in—and we think that the recent correspondence will lead any functionary who has not a passion for hot water to keep as clear of first-grade schoolmasters as he can—the Governing Body may wish to have, if not yearly, yet from time to time, a thorough investigation of the state of their school; even a Head-Master may be glad of such information, and in case of any shortcomings in the lower forms might feel his hands strengthened in dealing with that easily aggrieved personage, the assistant master, by the report of an independent Inspector.

It seems to us then to be desirable that in the first instance the inspection should be voluntary, and that the system should be left to grow according to its merits. The argument that University Inspectors could have no compulsory powers seems to us to tell in favour of University inspection. Each Governing Body would decide whether to have its school inspected or not; if any doubts about the state of the school were afloat, public opinion would enforce such an inspection, especially if the means were ready at hand. Government Inspection could hardly be so plastic; moreover, the presence of a Government Inspector in a school would give the boys an idea that it was not they themselves who were being put on their trial so much as their masters. They would be brought to see that there was a greater person in the world than Dr. Busby, and then the Doctor's authority would be gone; whereas boys are used to University examiners, examination and inspection shade off into one another, and there would be no show of external authority in the plan proposed. Again, if the Government undertook inspection, they would be expected to include sanitary and disciplinary matters. An Inspector is usually wild about cubic feet, and would drive House-Masters into fury by measuring the bedrooms. Now such supervision, though in some cases desirable, is little required in the first-grade schools, because the mothers of pupils are so keen about such matters that a Master's interest is involved in providing all material comforts for his boarders, and the present boarding-houses compete in luxurious arrangements.

The proposal of the Universities amounts to little more than an offer to undertake methodically and generally what has hitherto been done without system and on a small scale. Cambridge has really *inspected* of late about a dozen schools a year, but University *examiners* are provided under the statutes of most schools, and there is nothing to prevent these schools being examined just as they were before. The chief change proposed is that the examiners shall be appointed, or at least approved, by a Board formed of members of both Universities, which might lay down a few general instructions for the mode of inspection, and in the first instance receive the reports, which they would hand over to the Governing Bodies. It is made quite clear that the functions of the Inspector do not extend to reporting on what should be taught, but only to show how far the teaching is effective. When we see the names of Dr. Bradley, Dr. Kennedy, and Dr. Westcott among the promoters of the scheme—and so, we may suppose, probable members of the proposed Board—we cannot but think that the schools will find that they are in the hands of those who are more likely to understand their wants than any Government Commission. Further, the Masters of schools are themselves usually members of Convocation or of the Senate, and in that capacity they have a voice in regulating these matters. Any new measures will be discussed where they can be present and speak, which is material as affording them the feeling that they are themselves acting on themselves, and not subjected merely to action from without. Again, the financial aspect of the matter gives a result in favour of the University plan; for we find, by contrasting the fees paid by the University to Examiners with those paid by the Civil Service Commission, a vast difference in favour of the former, while the work is done just as well, and in some cases done by the very same people. This comes of what we said at the outset—the difference between working for a body of which a man forms part, and doing work for somebody else. But in addition to the Examiners the Government would require a Board of good scholars as a council of education to organize and superintend, and the members of this Board would have to be highly paid, while the Universities will provide all the administration, and find men of the highest capacity to do it gratuitously. Now as the country is not to pay for the education of the higher classes, the money must be extracted from the schools; that is to say, it will come out of the pockets either of the schoolmasters or of the parents. So that the public is interested in employing the cheapest machinery.

The University Inspectors, we may suppose, would be appointed by the above-named Board for a short period—say three years at first. It by no means follows that they should be University residents any more than the Local Examiners are. Those Inspectors who acquitted themselves satisfactorily would be re-appointed, and thus we should secure at last, by a kind of selection, a body of Inspectors more likely to be efficient than if they had held life appointments, as Government officials probably would. Moreover, considering as we do that independence is the life-blood of educational work, we think that the schools are safer with the Universities—who have a common cause with the schools in this point—than in the hands of a Government department, for the official spirit delights in hard lines. In France the teachers declare that they are "assassinated" by "réglementation." The Masters in England would have to be on the watch against the Government to see that their control did not extend itself from the manner to the matter of the teaching. Let it be recollected, that whenever the schools have come into the hands of the Government, *great schoolmasters* have ceased to be produced, although great scholars may have been schoolmasters.

The tone of the late correspondence may bring about some opposition at the Universities, especially with those who are mainly interested in the Universities as seats of learning. Some, too, may think that the Universities already have their hands full. These points we must leave to the residents, but we do not see that the programme of the scheme goes beyond what we should be glad to see the Universities taking in hand, if they have the means; and they have had so much experience in organizing extensive systems of examination that they may be trusted to judge of their own competency to do well what they undertake without detriment to their higher functions. Whether school inspection be generally adopted or not, we hope that the proposed "Leaving Examinations" in the whole work of each school will be carried into effect; and we quite concur in the wish expressed in the recent letter of a Head-Master, that this may lead to the discouragement of the system of specializing a boy's studies too early. The Universities, we believe, are alive to the evils which have arisen from the present open Scholarship system; and we think that the projected Board may be the means of bringing about that joint action between the Universities for want of which they have drifted into a system which hardly any College approves, but which each must adopt, or be content to go without its share of the abler young men.

DE MORTUIS.

AN old controversy springs up afresh at the death of every remarkable man upon whose merits there has been any considerable divergence of opinion. Each side has a commonplace to allege in defence of its own view. We should not speak evil of the dead, urges one party; and the other replies that we should speak the truth of every one, dead or alive. Undoubtedly this last

doctrine has an apparent advantage in point of sincerity and honesty. Is there not something offensive about the sudden change of sentiment which follows the death of such a man as the late Emperor of the French? When people who have been denouncing him whilst alive as a tyrant, a traitor, and a corrupter of society, suddenly affect a generosity which no longer costs them anything, and grow sentimental over the coffin of the man whom they used to revile, is not such generosity more insulting than continued animosity? The tears of enemies are not a proof that they have ceased to be enemies, but merely that they have ceased to be afraid. They were libellous before as they are now hypocritical. The friends of the deceased are excusable if they reject such posthumous praises with something like disgust. Flattery of the dead is merely satire in disguise, for every good word implies that the dead man must have had some exceedingly bad qualities which prevented even his better qualities from being recognized during his lifetime. The rule, therefore, should be, according to some persons, that death ought to make no difference. When a murderer is hanged, he is not converted into a saint. Death places a man beyond the reach of our hostility; but whatever lessons should be drawn from his career are precisely the same before and after it has reached its conclusion. The only difference, therefore, should be that we need no longer stimulate hostility. The judgment may be delivered without the passion which was pardonable during the heat of conflict; but the judgment itself should not be in any way altered. We can afford, it should be said, to regard your wickedness without active indignation now that it can lead to no fresh crimes; but what was wicked remains wicked to the end of time.

So far, indeed, there cannot be much dispute; but such reflections are not decisive of the controversy. There is, in fact, an obvious alternative. The maxim of speaking no evil of the dead may be interpreted to mean that we should hold our tongues if we have nothing good to say. Or, if absolute silence be impossible, we may, without concealing our unfavourable opinions, prefer rather to dwell upon that side of a man's character which has been least objectionable. Why, in fact, should we think it incumbent upon us to sum up the good and bad qualities of our neighbours as soon as they have left us? We are altogether too anxious to effect an accurate classification of men's characters, and to place them distinctly amongst the sheep or the goats. Innumerable historical controversies are carried on as to the inscrutable question whether somebody long dead should have a black or a white mark placed against his name. Why place either? How are we ever to say distinctly whether Cromwell or Mary Queen of Scots belonged to the saints or the sinners? Is not that rather a question for schoolboys than for grown-up men? A favourite motion in debating societies used to be that the character of so-and-so is deserving of admiration; but, as we grow older, we discover that our opinion of human beings is not to be packed into any such summary formula. We learn by experience the infinite complexity of human impulses, and the impossibility of fairly unravelling all the complicated skein of motive that goes to determine our own actions, to say nothing of the actions of other people. Who are we that we should profess to penetrate the bosoms of our neighbours, and by some spiritual calculus to sum up precisely the value of the good and the bad ingredients? By sufficient care we can arrive at some kind of knowledge of what people actually did; we may be able to decide what was Cromwell's system in Ireland, and whether Mary did or did not blow up her husband with gunpowder. In a rough way we may infer something as to the qualities by which such actions were prompted. It would be difficult, for example, to approve unequivocally of a lady who should be demonstrated to be a murderess and an adulteress. Yet even in such a case it is not easy to say how much allowance should be made for a vast variety of perplexing circumstances, for temptations which we have not experienced, and for motives which at best we can very imperfectly analyse. Still less is it easy to say how many good qualities may remain unextinguished side by side with great vices, and unable to restrain their possessors from grievous crimes. Here and there is a man who is nearly all bad, and another who is nearly all good. But in the infinite majority of cases the problem is so complex as to evade our feeble powers of analysis. As a rule, it is better to decline an impracticable task. Even amongst our own friends whom we see daily, and whose conduct may be tested in an infinite variety of ways, we are generally bewildered if we attempt to place them irrevocably in some mental pigeon-hole; and we are constantly making new discoveries which show how little we could have predicted their action under some fresh combination of circumstances. Why then endeavour to pronounce confidently about people at a far greater distance from us, of whose character we can judge only by remote inferences from uncertain evidence? We can in some degree trace out the consequences which have flowed from particular courses of conduct. We can see how the work done by one man has fallen to pieces with his death, and how the work done by another continues to bear fruit to remote generations. So far we may infer that he laboured on behalf of a sound or an unsound principle; and we may be grateful to him or pity him accordingly. But it is quite another thing to infer that the man who fought for a good cause was actuated by unselfish motives and a clear perception of the truths involved; or that the man who fought for a bad cause must therefore have had a corrupt heart and a muddled understanding. There are good and able men and there are bad and vicious men on all sides, or the world would be a great deal worse off than it is; for, as a rule, no side has a monopoly of the truth; and it is to be feared that, if good causes were supported only by men of correspondingly good character, they would have a very small minority of defenders. As a rule, in fact, the condemnation of some conspicuous actor means that we are opposed to his party. A Protestant argues that Mary must have committed murder because her theology was wrong; and a Roman Catholic that Cromwell must have been a hypocrite because he did not believe in the Pope. The calmness with which people set down every conspicuous adversary of their own opinions as wicked, though admitting in general terms that virtue is not confined to their own party, shows how valueless are most judgments of character. The circumstance which is most distinctly irrelevant is that which has practically by far the greatest influence on the verdicts which we pronounce. The tendency is curiously illustrated in Mr. Carlyle's writings. Regarding history as the record of the achievements of a few giants surrounded by a vast multitude of dwarfs, he always attributes to his heroes a distinct consciousness of all the results that flowed from their actions, and infers that their motives were correspondingly excellent. Yet surely it is a very rash assumption that because Frederick, for example, conferred great benefits upon Germany, therefore the advantage to Germany, and not the advantage to his own private interests, was his guiding principle. The truth would seem to be very different. When any great political change is useful to the mass of mankind, it is generally the plain interest of some distinguished leader to place himself at the head of the resulting movement; and it generally follows that we are quite unable to say whether selfish ambition or a wider patriotism determined his actions. Did men like Cromwell and Napoleon seize the government because they thought that the national interest required it, or because they wished to be rulers? They could probably not have answered the question themselves, and it is rash to give any decided answer for them.

The inference would seem to be that we should be much more cautious than we generally are in expressing an opinion about men's characters, whether dead or alive. We can very safely leave the question in other hands, and rather confine ourselves to the results of a man's actions than attempt the investigation of the hidden sources from which they flowed. In short, it is a sufficient reason for not speaking evil of the dead that we are for the most part in great ignorance whether or not he deserved it. The rule, it is true, applies equally during a man's life; but it is chiefly on occasion of his death that we are tempted to place ourselves in the judgment seat and sum up as though we had all the evidence before us. It would be more becoming at such a time to feel the depth of our own incapacity. Imputations of evil motive are so far excusable during a man's lifetime that they may force him to give an account of himself, and keep up a due sense of responsibility. It is extremely desirable that a man should be compelled to make the purity of his motives as plain as possible; and the greatest pressure we can put upon him arises from the free criticism of his antagonists. When he is dead that reason passes comparatively out of sight; he is no longer responsible to any human tribunal; and we may fairly recognize the impossibility of making any exhaustive summary of his motives. The feeling which leads us to attempt such a task is indeed natural enough, and requires some sort of satisfaction. The death of a great man is the closing scene of a striking drama. If his career has any coherency and completeness about it, it teaches some lessons, though it may leave us in utter darkness as to the actor's own qualities. Why, it may be asked, should we be more affected by the death of the Emperor than by the innumerable tragedies that are being acted all round us? Thousands of other people are dying in torture in hospitals and in hovels to whom we are more closely related. Many of them, it may be, have led far purer and nobler lives than any Minister or Emperor in the world. No gleam of secure happiness may ever have brightened their existence; whereas the Emperor, however melancholy may have been his last days, had some twenty years of exuberant prosperity. Is it not unphilosophical to be more affected by the death of the single conspicuous person than by the death of the thousands of fellow-creatures whose sufferings have been quite as poignant, and, it may be, less merited? The answer is plainly that it is not a question of philosophy. If we endeavoured to distribute our sympathy in accurate proportion to the mass of suffering, we should, according to the common illustration, be more moved by the destruction of a million of men in China than by the slaughter of half-a-dozen passengers in an English railway accident. Fortunately, however, for our peace of mind, we do not deal out our sympathy after this fashion. The effect upon the imagination is the measure of our feeling. A single death in our immediate neighbourhood affects us more deeply than any number of deaths in a remote country, not merely for selfish reasons, but because we can realize the details with incomparably greater distinctness. On the same principle we are influenced by the death of any distinguished person. We do not go through a statistical calculation as to the exact amount of suffering produced; but we are moved as we are moved by a tragedy. It is a question of poetry, not of reasoning. An incident which forms part of history moves us, not merely by its own intrinsic importance, but by all the associations which it brings up. The death of an old woman in the next street may sadden us if we happen to know her, and may suggest some reflections on sanitary reform. The death of a man who has played a conspicuous part on the stage of European politics carries the mind backwards and forwards through a long series of the most important events. The man's own personal interest sinks out of notice in comparison

with all the reflections suggested by his share in a great historical process. And therefore personal dislike is out of place, because it vulgarizes the sentiments suggested. Mere antipathy to the individual sounds paltry and pitiful in presence of thoughts as to the interests of nations and of mankind at large. The mind should be raised to a region where all personal dislikes seem infinitely petty and contemptible. The tone of feeling most in harmony with such reflections should be too solemn to admit of the intrusion of our little antipathies. We should be rather disposed to feel how imperfect are the judgments which we pass upon each other, and to regard censorious verdicts as something profane in the presence of loftier interests. Truth, of course, should not be sacrificed; nor should we speak with affected kindness of one of whom we really disapprove. But the expression of mere party or personal feelings is out of place at such solemn moments. They may be right or wrong; but they jar upon us like a false note in music, at a time when our minds should be attuned to a deeper strain of emotion.

THE HISTORY OF GREAT BRITAIN.

WHEN Britain first at heaven's command arose from out the azure main it was a very little place indeed, being about twelve miles by twelve, or under a hundred thousand acres, forming in a wide sea a small island now known as the heathy hills of the Longmynd and the Stiper stones on the borders of Shropshire and Montgomeryshire. But this first gem of the ocean was not, in a geological sense, destined long to maintain its place above those ancient waters: for just as the unnumbered islands of the Pacific are now slowly sinking and being swallowed up in growing reefs of coral, so this nucleus of old England sank steadily into a sea which we dare not call primeval; and, as it sank, the pebbly beach, strewn with bones of old cuttle-fish, heads and tails of trilobites, corals, Pentameri and other shells, crept in and in upon the land, till at length the last vestige of what we can hardly call our island disappeared beneath the waves, and its place for incalculable cycles of time was known no more. As the island sank deeper and deeper still, thousands of feet of Upper Silurian strata gathered thick above it; and the old life had long before almost all died away, or, like Bottom, been "translated" into a newer series of forms.

The physical relations of all these strata to each other was still a mystery to geologists long after "Father" Smith had conquered and reduced the Carboniferous and Secondary areas almost to perfect order. Nearly all that was known of the rocks of Wales was that, from underneath the Old Red Sandstone, called by Smith *Red Rhab and Dunstone*, there rose, in the land of the Cymry, certain slaty rocks known to miners as Killas. Here was an almost unknown land tempting the ambition of any one able to bring order out of chaos, and in the fulness of time Sedgwick and Murchison marched into the field, conquered, and took possession. The first, full of energy and power, struck at once into the mountain fastnesses of North Wales, and in a series of brilliant operations he brought nearly the whole of that tumultuous territory into subjection, and reduced it into comparative order, in spite of all its faults and convulsive throes, and called it Cambria. In like manner he mastered the wilds of Cumberland. The second went to work like the old soldier that he was, and, fixing his headquarters at Ludlow, at the bottom of an Old Red Sandstone escarpment, he established a basis of operations; and thence, creeping into the interior, he steadily advanced his lines westward along the scarped cliffs of Aymestry and Wenlock, through all the territory of Caradoc, down into the interior of South Wales, and gave to the whole conquered region the name of Siluria. At a period somewhat later De la Bèche with his staff again overran the whole of Wales, and the separate kingdoms of Cambria and Siluria were by him merged into one, while sundry allies in the North reduced all the South of Scotland, from the Mull of Galloway to the Lammermuir Hills and St. Abb's Head, under the same dominion.

But something yet remained to be done before these more primitive parts of Great Britain could be considered as fairly vanquished. Accordingly, after two successful campaigns in Russia, the old Silurian chief betook himself to the mountains of Scotland north of the Great Valley, and in three great forays revolutionized the country from the Grampians to Cape Wrath, converting so-called dead Azoic masses, dimly misunderstood and unintelligible, into well-proved Silurians, charged in some places with an old-world life. But a revolution that abolished all old titles North of the Grampians was not effected without opposition. Shall Ben Lawers and Ben Nevis, Ben More and Ben Mic Duibh, and nearly all the ducal territory of Sutherland, be hoisted up in the scale as a comparatively new geological province without regard to the time-honoured nomenclature of the mighty Werner, Jamieson of Edinburgh his lieutenant, and others their less powerful followers? Shall the soul of Lyell be made glad and the ghost of the great Hutton look down and smile approvingly while the primitive images so long worshipped of Gneiss and Micaschist, Chlorite and Talc-slate, Quartz and Crystalline Limestone are cast down and denuded of the halo that glorified them in the eyes even of their high-priests, and invested them in the eyes of the people with an antiquity so dim and sacred that even to disturb it was a sin? What then shall remain of primeval faith? Scarcely a vestige. And must its few remaining ministers, shrinking from the light, feel that they are doomed to fall into the ranks of those "partial spirits" who "still aloud complain," and "think themselves injured that they cannot reign"? But what availed the despairing wail of votaries for deities dispossessed? They were doomed to "receive the truth to whom 'twas pain to hear"; and in this manner the foundations of Great Britain were secured on a solid basis, resting, however, on older provinces, fragments of which here and there peep out in the stormy Hebrides, and on the still vexed shores about Cape Wrath. And just as from the disintegrated fragments of the old Roman Empire the modern nations of our Western world were formed, so by the crumbling waste of old Siluria the Old Red Sandstone grew around and over the ancient nucleus. Above its waters stood the Grampians, the mountains now called Cumberland, and icebergs dropped their stony freights on the storm-edged shores. Thus old matter was rearranged and accreted, and insensibly passed onward into that period when the growth and death and slow decay of dim and dreary forests in huge peat mosses and interminable flats resulted in the burial of that vegetable wealth which men call coal. During the process of its formation land and water alternated in the same area hundreds of times; and so vast was the period consumed in these operations, that in what we now call Wales the coaly relics of the earliest wood lie ten thousand feet underneath the highest buried forest; and between them a hundred terrestrial surfaces, each one of which bore vegetable growths which, had men lived to see them, would have seemed each in itself as venerable as those vast forests of the modern world that poets misname primeval.

Change is the one great law of the universe, and with growing age and slow physical revolutions all this came to an end; and when, in a succeeding epoch, the great ice-formed boulder beds known in Germany as the Red-dead-liers, and the Magnesian limestone had been laid in salt inland seas upon this our land, with these died out the last dwindling relics, few in number and shrunk in size, of that great old life which heretofore peopled the world. Then came "an awful pause prophetic of its end"; the Palæozoic succession had ceased to be; the old times were gone for ever; and as we imperfectly read it, a great gap appears in history between that closing scene and a newer life which links it to our own. A volume of old-world history has, in fact, not yet been altogether found. Society is very slow to change, and if new and changed forms have grown from older lives, the lapse of time between the dead old races and the new life that spread across our world denotes a period so vast that the human mind loses itself in the vain attempt to realize its meaning.

Had we space to rehearse the remainder of our story, we might indite the history of the arid shores of the great bitter salt lakes which, in times called by the Teuton *Bunter* and *Keuper*, lay partly within the bounds of Britain: and later still of that secondary portion of our history when a land called of Liassic and Oolitic age lay half submerged, and in a subtropical sea bloomed as a group of beautiful islands feathered with coniferous wood, tree-ferns, and araucarias, round whose sunny shores cuttle-fishes innumerable darkened the sea with squirtings from their sepian ink-bags, in their efforts to escape from glittering horny-scaled fishes, themselves the prey of giant fish-lizards, and their swan-necked allies the plesiosaure; while above, the air was darkened by the wings (rather small) of flying dragons. Along with these, a relic of the good old brachiopodus molluscs, rhynchonella and terebratula, battled well and successfully to hold their places in an altered and upstart lammellebranchiate marine world, along with which fantastic ammonites shoved the old straightforward orthoceras and the simple goniatile aside. From this luxurious state of affairs the country rose again into greater prominence; a wide-spreading land prevailed, and a vast river rolled its waters into an estuary (by moderns called the Weald), where reptile would-be two-legged bipeds devoid of feathers, the progenitors (?) of birds, aped the graces of geese and men. How long this state of affairs lasted no man as yet knows; but this we know, that it was brought to an end by the swallowing up of so much of Great Britain in the sea that only the tips of its mountains were bared to the air, while all the surrounding ocean was being overspread with deep layers of chalk. This period of depression came to an end at length, and Britain once more lifted up her drooping head, and rose to the day-star, in times called by men Eocene or the Dawn of our peculiar day, when beautiful things were made now—palæotheria and deer-like anoplotheria. These were the ancestors of all our modern types of mammalia, and during their time England was, perhaps, sometimes united to the Continent by physical ties now happily severed.

Common historians are apt to attach undue importance to the story of their own immediate times, and thus it happens that in some political histories the whole history of Great Britain before the Norman Conquest may be slurred over in a shorter space than the History of the Reform Bill of 1832. As we approach our own day we are inclined to run wild in that direction; and therefore, reversing the method adopted by Macaulay in his wonderful summary of the Roman period of Britain, we will attempt to compress the main history of our latter days in a few lines. We have said that England was joined to the Continent in Eocene times. Since then it has been disunited and rejoined to it again and again, and by some it is believed that in those middle-aged times called Miocene the first great migration of the immediate ancestors of the present northern mammalia migrated to our shores, more

varied and beautiful in form than aught that preceded them. This state of things, shifting yet the same, continued for long periods of time, both before and after those dark days when, like antarctic Victorialand and Greenland, Britain was shrouded in snow and thick-ribbed ice, and terrestrial life for a time may have almost disappeared. Twice at least was the land half lost in the sea, again to rise up refreshed, and each time the banished mammals returned with new associates, among whom at last, wandering across the broad plains that joined England to France, was the early race of man. Then for the first time in these regions

neighing steeds were heard
Unheard before by gods and wondering men;

and many animals, now domestic, mingled with the hippopotamus and rhinoceros, the ponderous elephant, and so many of those carnivorous beasts which still roam through parts of Europe, Asia, and Africa. With these, man, issuing from his wigwams and caves, long waged a constant warfare for food, by no means over-nice whether he devoured a horse, a deer, an ox, a wolf, an otter, or a badger; and at length, having exterminated the noxious carnivora, he now enjoys his land all the more that

Its high upreared and abutting fronts
The perilous narrow ocean parts asunder

from all direct neighbourhood with Continental allies or rivals. It will be well for all concerned should it so remain till the increasing eccentricity of the earth's orbit shall bring on a new Glacial period some fifty thousand years hence, and begin to banish man from the Northern half of Europe. Into the political situation consequent on that coming event it is, however, scarcely worth while to enter now; we would only say that it behoves the Minister for the Colonies to see that our intertropical possessions are kept in good order for the coming migration, for the fortunes of the British islands will then be far below zero. One cold comfort remains—the universal northern ice-sheet may possibly solve the Irish difficulty.

JUDAIC SERMONS.

WHEN Queen Elizabeth had any measure in hand, her manner, we used to be told, was to "tune the pulpits." We say "as we used to be told," because we have not, for the purposes of the present speculation, gone and minutely got up the historical fact. We bow for once to the doctrine that truth and falsehood do not greatly matter. That is to say, there may be truth of another kind in a statement which is historically false. For some purposes a spurious document may prove as much as a genuine one. For some purposes a romance may prove as much as an authentic history. And so, in some cases, a belief or tradition, even a groundless belief or tradition, that a certain person did so and so proves as much as if it had been the fact that he did it. So in this way, if any pedant, if any searcher after minute antiquarian accuracy, should be able to show that there is no ground to believe that Queen Elizabeth or her counsellors ever used a phrase which seems to savour so much of slang as that of "tuning the pulpits," it will not greatly concern us. It is quite certain that something very like what is understood by tuning the pulpits did go on in those days. The metaphor, or something like it, was one not unfamiliar in that quaint age. There is a story of a pair of sixteenth-century churchwardens being called on at a visitation to make a presentment as to the state of the bells. Among the bells they presented the pulpit as a bell which had for a long time lacked a clapper. That is to say, translating the presentment out of its allegorical dress, the parish had been a long while without a preaching minister. We may well believe that, by the time the bell was furnished with a clapper, it might be found to need a little tuning. No doubt, in those days it mattered much more than it does in ours what kind of note the bell and its clapper gave out. To large classes of people the pulpit was then, not only what it is now, but, what the parish school, books, newspapers, lectures, penny readings, everything of the kind also are now. It was in short the only way which large masses of people had of learning anything at all. The church was the only place where they had the chance of listening to a man who, if he did not know very much, at least knew more than themselves. It was only in the nature of things that the pulpit, or, in the language of allegory, the bell, should in those days ring out a greater number of tunes than it does now, and that the tuning of it should be looked on by those in authority as a more important matter than it would be now. The tuning of the pulpits, in short, meant that the preachers throughout England were bidden to preach in favour of any measure which the Queen and her Council were devising. So to do was pretty well the only means which there was of getting anything understood or known by the bulk of the people; and, could the same be done now, there are doubtless still nooks and corners where the parson's Sunday sermon is the only thing in the least degree of the nature of intellectual food which a good many people ever have set before them. In fact, we can conceive that there are places which heard more and learned more in the sixteenth and seventeenth centuries than they do now. They still have nothing but the parson's sermon to enlighten them, and the parson's sermon is not so enlightening as it was two hundred or three hundred years back.

Now, of all things in the world, one of the last things that we should wish would be for the clergy to imitate the practice of the sixteenth and seventeenth centuries in preaching what would be commonly understood by political sermons. We have many reasons for so wishing; one of them perhaps is, that if the clergy were to take to preaching political sermons, the mass of them would not preach such kind of politics as we should wish them. But we just now purposely used the qualification, what would be commonly understood by political sermons. That is, they should not so far follow the example of the days when pulpits were tuned as to preach for or against any particular Government, any particular candidate, any particular measure under discussion in Parliament. For, in the higher and wider sense of the word, we hold that they should preach political sermons—political, that is to say, in the sense in which, according to Aristotle, the highest form of the study of man's nature is the political science. Indeed, to come nearer to the range of what is ordinarily called politics, though nothing could be more improper than for a preacher to preach on behalf of a particular candidate or a particular measure, yet it seems to us that there could be no time richer than the approach of a contested election in materials for a really faithful pastor to give a word of exhortation to his people. The candidates must be very bad candidates indeed if it would be thought to be favouring one side more than another if a preacher set forth with all boldness the obvious moral duties of an elector. It is surely the pastor's duty at such a moment to tell his congregation that it is their duty, as reasonable and Christian men, to use the rights which the law gives them soberly and honestly according to the best of their discretion. It can be no breach of the strictest impartiality to point out that the elector, as an elector, has a moral and religious duty, to denounce bribery and intimidation in every shape as real moral offences. Such a discourse would be full of politics, but it would not be full of party politics. We should like to know what proportion discourses of this kind bore four years ago to those discourses which, instead of setting forth the moral duties of the elector, stirred him up by party declamation, by lavish use of the abused terms "sacrilege" and "confiscation."

The fact is that the great mass of preachers seem really to forget that those to whom they are speaking are Englishmen of the nineteenth century. It is strange how the Judaic leaven clings to us. It is an inheritance alike from mediæval and from Puritan times; but it is decidedly a case of salt which has lost its savour. Mediæval preachers and writers were brimful and running over with Old Testament quotations and allusions; but they never fancied that their hearers were Jews; they never forgot that they were Englishmen or Frenchmen of the time in which they happened to live. The references to the older dispensation might be allegories, or they might be examples, but they were all meant to have a very practical bearing on the state of things which was really going on then and there. So the Puritans had a vast deal to say about Amalek and Moab, and going to meet the Philistines at Gilgal, but it all meant that they were to fight manfully against the Cavaliers, or perhaps, in the mouth of a Scotch Presbyterian, against the Ironsides themselves. We seem to live among the same sort of phraseology without the same sort of application. The preacher goes on talking about Abraham, Isaac, and Jacob, David and Solomon and the rest, till he has reversed the vision of Ezekiel and has successfully turned the living men into dry bones. We believe that it would be quite unorthodox to bring out the real historical character of the Hebrew heroes, or to make any attempt to set forth to the congregation in what time and country and state of society they lived. So to do would be to make them men—men, as an apostle himself says, "with like passions as ourselves"—men who did not live in a sort of Nephelokokkygia created for the sole purpose of supplying texts and pointing morals, but who lived and walked about, and did sometimes good and sometimes evil in the common world of their own times, different as that world was from ours. The New Testament, to be sure, widens our field; we get Greeks and Romans as well as Jews; but all are to be dealt with in the same conventional kind of way, as if the people who happened to be mentioned in the Bible were a set of beings all by themselves, and in no way partakers of our common human nature. The unhappy Scriptural characters get preached about and made into proverbs, commonly on the strength of utter misconception of some particular passage which forms a convenient text. Unhappy Gallio, for instance, has passed into a byword as the "man who cared for none of those things," as the very type of the careless man who takes no heed to the things of his soul. But look at the story itself, and what were the things that Gallio did not care for? They had nothing to do with the things of his soul at all. The real fault of Gallio was a gross breach of his duty as a magistrate. "All the Greeks took Sosthenes, the chief ruler of the synagogue, and beat him before the judgment seat, and Gallio cared for none of those things." That is to say, a shameful disturbance and assault happened in court before his own eyes, and he did not do his duty in putting it down. Perhaps, if, in the days of the Popish Plot, a band of zealous Protestants had beaten the chief ruler of some unlucky handful of Papists before the judgment seat of Sir Edmundsbury Godfrey, that earnest defender of the faith might have cared for none of those things, as Gallio did in the like case. Then the record of the two Pharaohs who appear in the Book of Exodus—we believe that the genuine English Bible-reader or Bible-hearer never finds out that there are two Pharaohs in the Book of Exodus—is held up as if he were a blasphemer of the school of William Rufus. Whatever may be said for the custom of Greek, Latin, and English translators in putting the word Lord or the

equivalent for the Hebrew proper name of the Deity, it at least makes nonsense of the words of the Egyptian King:—"Who is the Lord that I should obey his voice? I know not the Lord, neither will I let Israel go." The unhappy Pharaoh has been preached at over and over again, as if he had defied a power whom in the same breath he acknowledged as Lord. We hope we shall not be thought profane, but the exact parallel to what Moses and Pharaoh did say would have been if, in the time of the Indian Mutiny, a zealous Brahmin, wrathful at greased cartridges, had gone to the Governor-General of India and said, "Thus saith Brahma, the God of the Hindoos, 'Let my people go, that they may serve me.'" It would not have been unnatural if he had got for answer, "Who is Brahma that I should obey his voice? I know not Brahma, neither will I let the Hindoos go." The much maligned Pharaoh is no conscious blasphemer at all; he is at most only an unbeliever. He knew nothing of the God of Israel, whose name he had perhaps never before heard; he worshipped Osiris and Apis and the other gods of his fathers. The worst that can be said of him is that he was less courteous to the preacher of an unknown faith than our own Ethelberht and Edwin; but perhaps, if Augustine and Paulinus had come from Wales instead of from Rome, they would have got no better answer.

A Jew then, or a Roman or an Egyptian who so far shares in the nature of a Jew as to be spoken of in the Old or New Testament, must not be talked about in a sermon as if he were a real human creature. And it would seem as if anybody or anything beyond the two covers of the Old and New Testament might not be mentioned at all. We speak of the common run of sermons, not of such sermons as the Dean and Canons of St. Paul's are not afraid to preach to rational Englishmen as rational Englishmen. In the regular conventional sermon there is not a word directly addressed to Englishmen of the nineteenth century as such. If anything out of the prescribed range is spoken of at all, it must only be by the darkest allusions, never by its own name. We remember a University Preacher, at the time of the Irish famine, talking of "that esculent which has recently failed." And we remember the protest of one of his hearers, "If Moses and the Prophets were not ashamed to talk about leeks, onions, and cucumbers, why should A. B. be ashamed to talk about a potato?" Then we remember very well in the days of the Russian War, how even in the pulpit men could not always keep themselves from a word or two on the matter of which every one was thinking: but how carefully everything was veiled under dark allusion how warily did the preacher avoid any direct mention of

> The Russians and the Turks,
> With their Babylonish works,

as if both alike were nations which, like the donkey in another sermon, decency forbade him to mention. To be sure we remember a preacher on the other side who delivered a series of discourses against Lord Palmerston, veiled only under the sweet name of Nebuchadnezzar. But we believe that the prophet's allegory was so successfully veiled under the sweetness of the five Chaldæan syllables that the congregation never found out at whom the thunderbolts were hurled. The rule seems to be that everything which regards the congregation as an assemblage of Englishmen, as men living in a certain age and a certain country, a country which has a certain past history and a certain present condition, is to be looked on as a forbidden subject in those discourses which are intended to give religious and moral instruction to the men who live in that country and in that condition; that is to say, they are never to be spoken to directly about those things which it most concerns them to hear. To be sure the day for sermons is Sunday, and we believe that both Sunday books and Sunday music are bound to be all about Jews, and that an Englishman would be looked on as a profane person who had no right to show himself on so holy a day. We are taught in the Catechism to do our duty in that state of life to which it shall please God to call us, and that state of life is in our case a state of life of Englishmen in the nineteenth century. Now, setting aside the exceptional class of discourses to be got from special preachers in special places, the ordinary average sermon never thinks of dealing directly and in plain words with the particular state of life of those who hear it. We get, we dare say, very good dogmatic theology; we get very sound general morality; but it is a theology and a morality which, so far as it belongs to any particular time or place, seems not to belong to England now, but to Judæa in ages past. It was a comfort when some time back we heard in a sermon a rebuke to one class of people who were "afraid of being called the parson's pet," and of certain other persons "who thought it charity to give to an organ-grinder in the street." It was a sign that we had got into an age and country of parsons and organ-grinders—in short, that we had wandered from Palestine to England.

Our forefathers, in what people pleased to call the dark ages, were in this matter better off. Whatever may have been their errors or superstitions, their religious and their national life were not dissevered. The men who worshipped at the shrine of St. Alphege or St. Thomas, of either Edward or of either Edmund, at least worshipped as Englishmen: their religious reverence gathered around the worthies of their own land. When a popular leader died in a righteous cause, men presently honoured him as a saint, and the curse of Rome could not hinder miracles being wrought by his relics. Out of a system like this, made up of so much that is good and so much that is evil, why cannot we pick out the part that is sound and healthy? Why cannot we learn that on a Sunday as well as on another day, in church as well as in another place, a man is still an Englishman of the nineteenth century, and is not changed for the nonce into a Jew of the days of the prophets, or even into a Corinthian or a Philippian of the days of the apostles?

PRINCESS CHARLOTTE.

It is impossible to imagine a more pathetic or touching story than that contained in the letters of the Princess Charlotte which have just been published in the *Quarterly Review*. The unhappy domestic circumstances amid which the Princess's early womanhood was passed were pretty well known already from Miss Knight's gossiping diary and from other sources. Her father bestowed on her a share of the dislike he cherished for her mother, and was jealous of her popularity and of her importance as heir to the throne. He wished to keep her a mere infant as long as he could, and would even have been glad to get rid of her altogether. He was cold, capricious, and tyrannical, and never hesitated, if he had a chance, to strike at the mother through the child to whom in her good-natured, foolish way she was sincerely attached. The old Queen hated the poor girl more heartily than the Regent did, and took a feminine delight in teasing and humiliating her. Miss Knight describes a dinner at Windsor on one of the Regent's birthdays, when he took no notice of the Princess or her attendants, but looked "as if he wished to annihilate us"; and when, on the Princess departing, it was expected he might say a kind word, he was found with some of the other guests underneath the table. That was the day when "the Duke of York hurt his head very seriously against a wine cellaret." "It was a bad business," says poor Miss Knight. The Princess had only 10*l.* a month for pocket-money, and generally lost more than this at cards at Windsor. The shabby, malicious way in which she was treated by her father and grandmother irritated and provoked her, and made her anything but docile. When she wrote to Lord Liverpool to demand an establishment of her own, the Regent complained bitterly to Lord Eldon, who declared before a roomful of Royal Highnesses, "If she had been my daughter, I would have locked her up." This brought the poor Princess's humiliation to a climax. "What would the King say," she exclaimed, "if he could know that his grand-daughter has been compared to the grand-daughter of a collier?" It is not a pretty picture that is presented in Miss Knight's pages, but we get the impression that the Princess, though badly used, sometimes rather enjoyed the squabblings and contentions as some relief to the dull monotony of her life. The correspondence of which an account is given in the *Quarterly* shows, however, that she felt acutely the cold and heartless treatment to which she was subjected. Her mother quitted her father's house soon after she was born, and it was not long before the baby was packed off too: but not to a distance. She was established, with a staff of governesses and maids, at Warwick House, a small building adjoining the garden of Carlton House. Her father seldom saw her, and it was only on rare occasions that she visited the old Queen at Windsor. But every Saturday afternoon she had a treat; she was taken to the house of her other grandmother, the Dowager-Duchess of Brunswick, where she spent an hour or two with her mother, who, whatever her faults, was always kind and affectionate. These Saturday afternoons were the great events of her dull, neglected life, and they were further brightened by the presence of one or two playmates, the children of parents living at Blackheath, who were permitted to visit her at her grandmother's. These and a few others remained her friends through life, and to one of them the letters of which extracts are now given were addressed. They begin in 1813, when she was just seventeen years old. "The handwriting is scrawling and illegible to a degree, and bears evidence of her neglected education. The grammar is often at fault, the style stilted and pompous, like that of the novels of the last century, with which she had probably a large acquaintance." Still they are full of natural and unaffected feeling. She hopes her friends will not forget her, and will "think sometimes of her fate." The old Queen did all she could to keep her friends from her, and lectured her on "princely dignity," at the same time cultivating that dignity by snubbing her as much as possible, and keeping her perfectly in the dark as to all the arrangements of her establishment.

One day the Princess writes from Warwick House to say that she is in town again. "In every sense of the word it is for good, as I am quite well again, and indeed feel quite comfortable, as I have been *left quiet*." There could hardly be a more touching or suggestive description of her state of life. She had come to consider it her highest happiness to be let alone, to be forgotten by her father and tabooed by her grandmother, and to be taken no notice of whatever. There is a great party at Carlton House "for all the foreigners," and she is as much puzzled as pleased because her father was civil to her. "The Prince was in very great good-humour with everything and everybody, myself not excepted." It turns out, however, that the Prince had his reasons for it. He had been planning a match between Charlotte and the Prince of Orange. Miss Knight tells us that when the Princess heard she was to meet the Prince at Lady Liverpool's she put on a blister, which was her excuse for keeping away. She also declared that he was so ugly that she was sometimes obliged to turn her head away from him when he was speaking to her; and she told Sir Henry Halford that she would marry the Duke of Gloucester, but not the Prince of Orange. Of all this there is no mention in this

correspondence. The Princess writes at first as if she had been rather taken by the Prince, but there can be no doubt that it was her eagerness for release from the kind of servitude in which she was then living, and her hope that marriage would procure her an independent establishment, which led her to try to persuade herself not to dislike the Prince of Orange. As the affair went on she saw more clearly that the great object of the Regent and of the old Queen was to get rid of her, at any rate for a time, and that it was intended she should live permanently abroad. "My own family, and the head of it too, is very desirous," she says, "I should leave this country, which I cannot say I am, as I feel naturally excessively attached to the country I was born and educated in." She was willing to marry for peace and independence, but not for exile, and a fixed repugnance to the Prince took possession of her. The writer of the article in the *Quarterly* states, on the authority of an eye-witness, that the marriage was really broken off in consequence of a petty and trivial incident, which was evidently only a pretext. The Princess asked her betrothed to ride with her in the riding-house. When he objected, she reproached him with his want of attention; he got bored with her vehemence, and left her to "recover her temper." She wrote to him the same evening to break off the match, a resolution to which he submitted more philosophically than her father. We may turn to Miss Knight for the scene which followed. When the Regent found that his daughter's determination could not be shaken he was very cold, very bitter, and very silent. One afternoon in July he and the Bishop of Salisbury came to Warwick House, and the Regent went to the Princess's room. He was shut up with her for three-quarters of an hour, and then the Bishop was sent for. At the end of the hour "she came out in the greatest agony," and told Miss Knight that she and all the household were to be instantly dismissed. Then she fell on her knees, exclaiming, "God Almighty! grant me patience." The Prince Regent apologized to Miss Knight for putting her to inconvenience, but he wanted her room at once. He refused to give any reasons for thus turning her out of the house; and she replied with spirit that her father had served His Majesty for fifty years, and sacrificed his health and fortune in that service, and it would be strange if she could not put herself to a little inconvenience on the same account. Meanwhile the Princess had slipped out of the House, and was off in a hackney cab to her mother's in Connaught Place, with a rush of great dignitaries after her. After some "kicking and bouncing," as Lord Eldon called it, she was recovered and shut up in Cranbourne Lodge at Windsor, with a set of strange attendants. It was a rigid imprisonment, scarcely disguised. She was not allowed to see any of her friends, and it was only as a great favour that she was occasionally allowed to write to one of them. Letters from and to her were frequently intercepted. She was tortured by the indignities to which she was subjected, by doubts as to what was being said of her in the world outside, and by the uncertainty of her position. She was like a criminal condemned to execution, and constantly expecting to hear the fatal summons. Some new proposal of marriage was evidently her dread. "What may or may not happen," she writes, "God only can tell; for those who are happy, looking forward is a happy reflection; for those unhappy, a sorrowful one of uncertainty." And then she speaks of her bitter mortification, "heightened by bad spirits and presentiments of God knows what," and of "pains and pangs that come sometimes, and make one think one's heart will quite break." She sends her friend some trifling gift as a remembrance; it is all she has to offer of her own, for she has "no means of any sort to procure what might be more worthy your acceptance."

Afterwards she is back at Warwick House, but sees nothing of her father, "though next door." Her situation is still wretchedly uncertain and uncomfortable. "I always think six months got over of this dreadful life I lead six months gained." There is a weekly visit to theatre or opera, and that is her great delight; "Miss O'Neil beats everything that ever yet has been seen, or ever will be again, I think." A trip to Weymouth affords little solace. Her "crocodile luck," she fears, pursues her, and her "life is quite that of uncertainty from day to day, hour to hour, and total ignorance as to what my fate is to be, where to go, and how things are to be arranged." But even in her greatest trials she was always thoughtful and considerate for others, and her letters are often more about her correspondent than about herself. It is evident from this correspondence that the Princess, though she had seen Prince Leopold and admired him, had never thought of him as even a possible suitor for herself. She was even under the impression that he was paying his addresses to another young lady, and anticipated nothing better for herself than a *marriage de convenance*. It was in 1816 that the Prince, to her delight and surprise, returned to England to propose for her hand. The Regent was gracious, and the Princess, it will be understood, threw no obstacles in the way. Her life had been one of such isolation, and she had suffered so much from coldness and want of sympathy, that her intercourse with Leopold was like the opening of a new world, a dark bleak day passing on the sudden into soft and genial sunshine. Her marriage was perfectly happy. Her husband appreciated her generous impulsive character, and knew how to check her little violences of language or demeanour. She called him "*Doucement*," from his phrase "Doucement, ma chère, doucement!" and good-humouredly obeyed. Her last letter is dated October 24. She "continues well," she says, and is cheerful and confident. A fortnight later she was dead. The intense sorrow of the nation was due rather to the circumstances of her death than to appreciation of her character, of which, indeed, little was known except by rumour and conjecture. But it is pleasant to learn that she possessed qualities of mind and heart which fully justified the hopes which were entertained of her, and the outburst of feeling which was produced by her sad fate.

ARCHBISHOP MANNING ON ULTRAMONTANISM.

ON Tuesday evening last Archbishop Manning delivered an address before the Catholic Association of Sheffield on Ultramontanism, which he was anxious to vindicate from the charge of being opposed to progress and patriotism. His argument, so far as any argument can be extracted from his easy flow of rhetoric, is the reverse of convincing; but the discourse, if correctly reported, is so very rambling that we can but take the *disjecta membra* as they occur, and make such comments as suggest themselves. The speaker begins by laying down as a fundamental principle that "the Catholic Church was isolated, being, as it was, a society knit together by its own laws, and having no contract (contact?) with any other body." And this, he observed, had been the case from the earliest days, when the world was still heathen. "A Christian society was from the first formed, and in later times, when Christianity became more general, there was still (?) an identity between the Church and the Governments of the world. Was that the case now?" It appears, therefore, that at one time the Catholic Church had a very close contract or contact—whichever it may be—with the civil Governments, and that it is their fault, not hers, that the contact or "identity" does not still continue. "Three centuries ago the North of Germany and England broke up the unity of the world and cast off the legislation which had sprung up in the Church." For the world must, we presume, be read Europe. And if by unity is meant political unity, as seems to be implied, under the old suzerainty of the Pope, it had been broken up long before the Reformation, and the responsibility of the century of religious wars which followed rests quite as much on the Catholic as on the Protestant side. Dr. Manning adds that in the last century the Catholic countries of Europe adopted the same policy and completed the work begun by Luther, "until at last they had arrived at that greatest of all impositions, 'a free Church in a free State.'" "How could Catholics, who believed that the Church was one, identify themselves very closely with a State which admitted all creeds and all forms of worship on the same level?" This doctrine—which, it seems, startles even Sir George Bowyer—is, of course, in strict accordance with the doctrine of the infallible Syllabus, which condemns the practice of tolerating a diversity of worship in Catholic States, and the opinion that the Church has no right to enforce her teaching by temporal penalties. But it is not very reassuring as to the progressive and patriotic character of Ultramontanism. "There was a time when there was but one religion instead of thousands," and had the persecuting policy commended by the Syllabus been consistently carried out that time would have lasted on; for "Catholics, like the courtiers of Frederick II., might answer to Protestants, that there would have been only one religion still if their forefathers had been of their opinion." This reminds one of M. Veuillot's well-known statement in the *Univers*, though the Archbishop is naturally more cautious in his language than the journalist:—"For my part, I frankly avow my regret not only that John Huss was not burnt sooner, but that Luther was not burnt too. And I regret further," adds M. Veuillot, in apparent oblivion of Philip II. and Louis XIV., "that there has not been some prince sufficiently pious and politic to have made a crusade against the Protestants." Dr. Manning, indeed, himself puts an important limit on his patriotism when he accepts Lord Denbigh's oft-quoted boast that he is "a Catholic first, and an Englishman afterwards," and justifies it by the ingenious plea that all good Protestants would say they were Christians first, and Englishmen afterwards. This may be, but an Ultramontane—and in the Archbishop's mouth Catholic and Ultramontane are synonymous terms—means a good deal more than a Christian. It means a person whose first and supreme duty is to obey the behests of an infallible Pope; and for more than two centuries obedience to the Pope involved the refusal, under pain of excommunication, to acknowledge the civil supremacy and independence of the English Crown.

But the Archbishop rejoins that no distinction can be drawn between Ultramontanism and Christianity, for Ultramontanism *is* Christianity. "The Christian world was created by Christianity. Christianity was the Church; the Popes were the head of the Church. *The Papacy was Ultramontanism*, and Ultramontanism therefore had brought about the advancement made up to the sixteenth century." Ultramontanism, therefore, is not the enemy, but the origin and instrument, of progress. On all which two or three obvious comments occur to one. In a certain sense it is true that in the middle ages, while the clergy was the only learned class, the Papacy was mainly instrumental in promoting the advance of civilization. But Ultramontanism, in the modern sense of the word, is only a hundred years older than Protestantism, and dates from the Papal reaction against the reforming Councils of the fifteenth century. We are not concerned to contradict the Archbishop's assertion that "it would not stop the making of one locomotive, and that the Lancashire spinning-jenny would go just as well when guided by a Catholic as by a Protestant." But how far the system has tended to promote even material progress, of which it

has no particular reason to be jealous, may be judged by a comparison of the condition of Catholic and Protestant countries during the last three centuries. What it has done to stop intellectual progress is still more conspicuously exemplified in the meagre and stunted literature of Italy and Spain, and may be learnt from a study of the decrees of the Inquisition and the Index during the same period. Has Dr. Manning ever chanced to meet with a pamphlet, generally attributed, we believe, to a priest of his own diocese, which has run through two editions, on *The Pontifical Decrees Against the Motion of the Earth Considered in their Bearing on the Theory of Advanced Ultramontanism?* The learned author, after proving conclusively that the opinion about the motion of the earth which is now held by all educated Catholics was formally condemned by the Holy See as heretical and false, and that its authors were compelled to retract it—a condemnation afterwards solemnly ratified by a later Pope (Alexander VII.), in the Bull *Speculatores Domûs Israel*—thus sums up the results which "Galileo's case incontrovertibly teaches." "Rome—*i.e.* a Pontifical Congregation informed by the Pope—may put forth a decision scientifically false and doctrinally erroneous. . . . The Pope may call upon a Catholic to give unreserved assent to a judgment doctrinally erroneous. The Pope may command a Pontifical Congregation to promulgate as a part of the teaching of the Holy Catholic and Apostolic Roman Church that which is scientifically false and doctrinally erroneous . . . and use his authority as Pope to indoctrinate the Church with a false opinion respecting Holy Scripture." We have referred to this pamphlet for the purpose of showing, and that on Catholic authority, that if "the Papacy is Ultramontanism," Ultramontanism has not been so favourable as Dr. Manning appears to suppose to scientific progress; and he must be aware that even such mechanical inventions as the locomotive and the spinning-jenny ultimately depend on the advance of abstract knowledge.

But we are reminded by the next passage in his address that our citation will also serve another purpose. "The speaker went on to refer to the opposition in England to the infallibility dogma, saying that all the decrees of the Vatican Council were loyally received by every priest and bishop in Christendom, except the little body of Old Catholics in Germany and France." Archbishop Manning shows his discretion in omitting all reference to the laity, among whom the new dogma is known to be widely disbelieved, or received, if at all, with explanations like Mr. Maskell's, which deprive it of all intelligible meaning. But is he quite sure he is right about the bishops and clergy? No doubt there are not many signs of open resistance among the priesthood, for obvious reasons, but, unless we are greatly misinformed, there is abundance of unacknowledged disbelief. The author of the pamphlet just referred to, the second edition of which appeared the year after the Vatican Council, must have greatly changed his views if he accepts the dogma. And as to the bishops, not to speak of others less known, we have yet to learn that Strossmayer has submitted. And what value is to be attached to the testimony of those who have submitted, after their own explicit avowals during the Council, may be learnt from Lord Acton's unanswered *Letter to a German Bishop*, which was noticed at the time in our columns. Of the manner in which the German bishops explain, or explain away, the doctrines which they now profess to accept and are tyrannically enforcing on others, we had something to say the other day, and it is amusing to find our estimate of the gloss they put upon it emphatically endorsed by an Ultramontane correspondent of the *Tablet*. But, putting this aside, there is the widest possible difference between the Archbishop's own thoroughgoing acceptance of the "personal, separate, independent, and absolute infallibility" of the Pope, in all that directly or indirectly touches on faith and morals—a doctrine publicly asserted by one of his suffragans to "take rank with the doctrine of the existence of God"—and the very hesitating and equivocal interpretations of some of his episcopal colleagues. Archbishop Kenrick of St. Louis, who in his published *Concio* expressly denied the truth of the dogma and the competence of the Council to define it, in announcing to his clergy his formal submission, added that he was still unable to reconcile it with history and tradition, and is well known to have declared that he will never preach it. Bishop Brown of Newport, who appears from the *Catholic Directory* to be the senior bishop of the English hierarchy, in his Pastoral on the subject expressly declines to accept any Papal utterance as infallible when any one of a number of previous "precautions" has been omitted, which precautions are not only not laid down as conditions of his infallibility in the decree, but are distinctly implied to be entirely optional; and he then adds a still more important reservation of his own—namely, that, "supposing, for the sake of argument, a Pope should promulgate false doctrine, the Church, dispersed or in Council, will correct the error." Infallibility, therefore, belongs not to the Pope, but to the Church, which was the old Gallican doctrine. Hefele, the most learned of the German bishops, after holding out for a twelvemonth, was reduced to submission by a threat of withdrawing his faculties. We referred just now to a remarkable pamphlet of Mr. Maskell's, professing—in language which, to say the least, is startlingly ill chosen, if the profession is not meant to be ironical—his acceptance of a dogma resting on a foundation which "no truth rests or ever did rest upon" before, which is based "on nothing greater than the authority of a Papal promulgation of the decrees of an unfinished Council," and a decree the like of which "no Œcumenical Council since the days of the Apostles" ever issued yet. With Mr. Maskell's own opinions, however, we are not here concerned. But he assures us—and he ought to know—that the sense in which "one of the most learned of the French bishops" accepts the new dogma is the following:—"That as no Pope hitherto, so far as we can possibly learn, has spoken *ex cathedrâ*, so it is not probable that any ever will hereafter." When, then, it is said that the doctrine is "loyally received by every bishop in Christendom," it is important to remember that—supposing the fact to be so—this loyal reception may include anything from the thoroughpaced infallibilism of Dr. Manning and the *Dublin Review* to Bishop Brown's theory of a provisional infallibility which the Church will correct "if unhappily" it makes a mistake, or the still more recondite infallibility of the most learned French bishop, which escapes all danger of speaking wrongly by taking care never to speak at all. A definition so wonderfully elastic may fairly be considered the crowning triumph of Talleyrand's theory of the use of language. And if Ultramontanism meant no more than this, neither progress nor patriotism could have anything to say against it. But it meant a good deal more than that in the case of Galileo, and it means a good deal more now, if the *Civiltà Cattolica*, the accredited organ of the Holy See, is right in maintaining that "every baptized person is more the subject of the Pope than of any earthly Government." And the stringent measures on clerical discipline and education just introduced into the German Parliament, which can only be justified on the plea of necessity, and are expressly alleged by the Government to be rendered necessary by the Vatican decrees, prove clearly enough that the leading Power of the Continent does not agree with Dr. Manning that there is nothing unpatriotic in the position assumed by Ultramontanism.

THE CLAIMANT'S CHAMPIONS.

IT will be remembered that on one occasion the valiant Knight of La Mancha got himself into trouble by rescuing from the hands of justice a number of pitiful fellows whom he met in chains upon the road. Mr. Whalley and Mr. Guildford Onslow have lately been engaged in a Quixotic enterprise of a somewhat similar kind, and they, too, have not exactly covered themselves with glory. Not content with actively supporting the defence of the Tichborne Claimant, they have attacked the administration of justice, and have endeavoured to persuade the public that the processes of law were being corruptly and wickedly warped and strained against an innocent man. For this they have been very properly rebuked and punished by the Court of Queen's Bench. They have had to apologize humbly for their offence, to promise—like naughty little boys under the birch—not to do it any more, and to pay 100*l.* a piece as a fine to the Crown. It is necessary to observe that Mr. Whalley and Mr. Onslow have been punished, not for assisting the Claimant, but for attacking other people, and for attempting to prejudice the course of justice. At this moment the Tichborne Claimant is, as it were, in the position of a man who has been condemned by one Court, and who is waiting the result of an appeal to another tribunal. He failed to convince the jury in the civil suit that he was not an impostor, and the judge had no alternative but to order him into custody. A grand jury have returned a true bill against him for perjury and forgery. He has still another chance of clearing himself of the charges against him, and we have no right to speculate as to the result of this final trial. It would be absurd, of course, to say that in such a case the public can absolutely suspend its judgment. There are people who think that the evidence at the first trial was sufficiently conclusive; and there are others who think it was not. But nobody knows what sort of a case will be made out for the Claimant when he appears before the Court of Queen's Bench. Old evidence may be presented in a new light, or new evidence may be forthcoming. Indeed Mr. Onslow has promised that at least one very remarkable piece of fresh evidence will be produced. This is the "identical collar" in which the Claimant was saved from the wreck of the *Bella*. It was thought rather odd at the first trial that the Claimant should alone have survived the wreck of the *Bella*, but he will now have an opportunity of proving that his collar also survived. "A man at Merrybong," in Australia, was driving along a road ten years ago. He saw a bit of rag lying in the road. Australians have perhaps the same superstitious reverence for rags that the Chinese have for scraps of paper. At any rate, the "man at Merrybong" thought it worth while to stop his gig, get down, and pick up the precious bit of cloth, which proved to be nothing less than the missing link of a great law case. It was a shirt-collar, signed with the name "R. C. Tichborne," and the signature will be proved to be in Roger's own writing. We were not aware that heirs to baronetcies were in the habit of signing their linen; but no doubt this would be "just like Roger." It is often said that truth is stranger than fiction, and here is an example of it. It is possible that when this collar is held up in court the jury will feel convinced that Roger really escaped alive from the *Bella*, though everybody else was drowned, and though all trace of the ship which the Claimant says picked him up has vanished as completely as if it had been the *Flying Dutchman* on a ghostly cruise.

Mr. Whalley in one of his speeches deplored the "extraordinary infatuation of silence" which has been exhibited by the press in regard to the forthcoming trial of the Claimant;

but it is a pity that Mr. Whalley's infatuation did not take the same harmless turn. The reticence of the press was simply respect for the administration of justice. It was felt that the Claimant had better be tried in a court of law than at a public meeting, and that an appeal to universal suffrage on charges of felony might be an awkward experiment. Mr. Whalley says that he took the sense of his constituents on the subject, and found them strong for the Claimant; but it does not appear that there was a similar plébiscite at Guildford. The Lord Chief Justice in giving judgment observed that the Court was "far from saying that, when persons believe that a man who is under a prosecution on a criminal charge is innocent they may not legitimately unite for the purpose of providing him with the means of making an effectual defence." "Any expressions," he added, "intended only as an appeal to others to unite in that object, though perhaps not strictly regular, could not be fit matter for complaint and punishment." Unfortunately Mr. Whalley did not stop here. He went about publicly declaring that there was an abominable conspiracy against the Claimant; that the Tichbornes and the Radcliffes and the Doughtys knew perfectly well that the Claimant was the real Roger; that the Attorney-General and the Government knew it too; and that they were all in a league to prosecute a man whom they knew to be innocent of the charge brought against him, and to deprive him of his inheritance. Half-a-dozen people met in a drawing-room and said, "We will keep this man's estates. We are strong enough in Parliament, strong enough on the judicial Bench, strong enough in society, to defy the laws of England." This is Mr. Whalley's story, and it was on the strength of this alleged conspiracy, "so widespread, so black, so utterly incomprehensible, extending its root through so many institutions of our country," that he appealed to the public to subscribe for the Claimant's defence. He said he was "prepared to meet the Attorney-General, or any six counsel most eminent at the Bar, or any other advocates that might be put forward, and to satisfy any intelligent London audience of the truth of his assertion." Mr. Whalley had his wish granted, but he made strangely little use of the opportunity he had so eagerly desired. Possibly he may not consider the Judges of the Court of Queen's Bench an "intelligent London audience." At any rate he did not attempt to offer any proof of the monstrous accusations which he had been circulating through the country. Mr. Whalley appears to think that it is consistent with the position of a gentleman and the dignity of a member of Parliament to travel about charging the Government and a number of private persons with being engaged in a conspiracy of the most atrocious and wicked kind, and, when brought to task for this language, to have nothing to say for himself, except that he did not mean any harm. The Lord Chief Justice naturally observed that such an apology could be accepted only as derogatory to the understanding of the person who made it. When Mr. Whalley's counsel urged that this was a novel case, Mr. Justice Blackburn said the only novelty in it that he could see was that the gentleman's name was Whalley. This is certainly not the first time that a foolish person has got into trouble by unwarrantable observations on a pending trial; but there are degrees of folly, and perhaps Mr. Justice Blackburn scarcely did justice to the novelty of Mr. Whalley's character from this point of view. There is only one Whalley, and by the side of him Mr. Onslow acquires almost an air of reason and sobriety. Mr. Onslow talked less wildly, and was more prompt and unreserved in his apology; but he was justly held responsible for his colleague's violence.

It will occur to most people that, in starting this theory of a gigantic conspiracy spreading through society, the Government, Parliament, and even through the Bench itself, the Claimant's champions are adding rather unnecessarily to the burden of his defence. He has almost enough on his hands already. Let him be satisfied with showing that the thin, slight, shy, gentle Roger, who spoke French better than he spoke English, and who was on the most affectionate terms with all his family, has really turned up in the big, burly, and by no means shy Castro, who cannot speak a syllable of French, who cannot even pronounce correctly the French name of the mother he claims, and who from the moment of his landing in England he shunned his relations as if they were the plague. There are little difficulties to be cleared up about the tattoo marks, the shipwreck of the *Bella*, and the mysterious vessel that picked up the Claimant; about Roger's schooldays, and Castro's keen interest in the Ortons. In short, there is quite enough work cut out as it is for the Claimant's counsel without making it a part of their case that there is a "black and incomprehensible conspiracy" against their client. The possible mischief of the wild and reckless language which has been used by Mr. Whalley and Mr. Onslow goes beyond this particular case. They have endeavoured to produce in the minds of ignorant and foolish people an impression that poor men do not get justice, that there are influences which override law, and that officers of the Crown are capable of conspiring with rich and powerful families in order to rob and ruin an innocent and helpless man. The whole tendency of the scandalous agitation in which they have taken the lead has been to discredit the administration of justice, and to shake public credit in its integrity and independence. A question has been raised as to whether the House of Commons might not, under certain circumstances, have been disposed to throw the shield of Privilege over the offending members. That their conduct will be brought under the consideration of the House can hardly be doubted; but it will be for another purpose. The Court of Queen's Bench was content to deal with the contempt of Court which was involved in an attempt to prejudice the course of justice in a pending trial. It remains for the House of Commons to find some means of vindicating its own dignity and the personal honour of its members. The Attorney-General is not only an officer of the Crown, but a member of Parliament, and he has been publicly accused of having committed one of the most abominable and wicked crimes which it is possible for a man in his position to commit. Other members of Parliament have been similarly attacked. These charges have been made, not by obscure and insignificant persons, but by two members of the House which has thus been outraged and insulted. It is no excuse to say that Mr. Whalley is only a foolish person who is always doing foolish things, and that Mr. Onslow, who was less intemperate in his language, allowed his feelings to overcome his prudence. There are limits to the privileges of folly, and those who engage in public agitation must be held to be responsible for the excesses of their associates when they do not interfere to check or rebuke them. It is impossible to exaggerate the greatness of the public scandal, as the Lord Chief Justice very properly called it, with which Mr. Whalley and Mr. Onslow have chosen to identify themselves; and it will be for the House of Commons when it meets to mark its sense of their unwarrantable and mischievous conduct. As for the Claimant himself, a man who has charges of perjury and forgery hanging over his head may perhaps be indifferent to the consequences of contempt of Court. Nothing could be more disgraceful than his language at Brighton in reference to the judges, and perhaps for his own sake the best thing that could happen to him would be to be locked up till his trial comes on.

GREENWICH.

THE establishment of the Royal Naval College at Greenwich is an event almost as significant as was the original foundation of Greenwich Hospital. The commencement of what may be called the modern history of the British navy dates from the foundation of the Hospital, while the necessity of scientific as distinguished from merely practical training for naval officers is fully recognized by the establishment of the College. The younger of the two Dutch admirals who bore the famous name of Van Tromp was taken to sea at eleven years of age, and many of our own most celebrated admirals began to learn seamanship quite as early. They knew their business thoroughly, but they knew little else; whereas it is now considered necessary that a naval officer should possess a good general education. The chief opponents of Van Tromp and De Ruyter were, indeed, soldiers who happened to be employed at sea; but immediately after the age of Blake and Monk comes that of Cloudesley Shovel and Benbow. The growing interest of the country in naval affairs after the Restoration may be inferred from contemporary literature. It was Charles II., "at length resolved to assert the watery ball," who gave his name to the first in order of time of the buildings which composed Greenwich Hospital. The labours of this King's servants to establish an efficient navy were ascribed in courtly poetry to the King himself. Dryden has clothed many absurd sentiments with vigorous language, and we almost forget, as he celebrates the naval conflicts of his time, that the King who inspired a navy with loyalty and patriotism was Charles II.:—

> It seems as every ship their sovereign knows,
> His awful summons they so soon obey;
> So hear the scaly herd when Proteus blows,
> And so to pasture follow through the sea.

The process of repairing a fleet after a sea-fight may not seem suitable for poetry, yet Dryden could write upon this subject lines which will still repay perusal. Just as the King of France was supposed to take Dutch towns, so the King of England was conventionally the instructor of his people in seamanship, naval architecture, and cannon founding. The battles of that period were chiefly fought in the sea which lies between Harwich and the Scheldt, and the English fleets which contested with the Dutch were fitted and repaired in the Thames. Hence the naval interest of this reign centres in Greenwich, and King Charles II. may, at least for poetical purposes, be supposed to have made experiments in gunnery at an adjoining arsenal. The naval history of his reign was not, however, uniformly glorious. A Dutch fleet entered the Medway and threatened Chatham. Monk was ordered to provide what protection he could for the ships and stores lodged there. He found no cannon mounted, no batteries or ammunition prepared, and Upnor Castle converted into a pleasant official residence. He collected a few companies of soldiers to oppose the audacious invasion of the Dutch, but the seamen who were about the arsenal became mutinous, and unwilling to obey in anything. Then the old man stood with his cane in his hand to enforce obedience, while the shot from the Dutch ships fell thick around him. One of his officers entreating him not to expose himself unnecessarily, he answered, "If I had been afraid of balls, I should have quitted the trade of a soldier long ago." This discreditable event occurred in the next year to that of which the naval glory has been celebrated by Dryden. The Dutch Admiral De Ruyter had been defeated and compelled

to retire before Monk in 1666, and he had received praise from the English poet, which next year he showed that he deserved:—

> Oh! famous leader of the Belgian fleet,
> Thy monument inscribed like praise shall wear
> As Varro, timely flying, once did meet,
> Because he did not of his Rome despair.

It will be seen, on looking through Dryden's verses, that shipwrights and sailors used nearly the same terms in his day as they use now. The Thames has greatly altered its character during the last thirty years, but before that time Deptford and Sheerness appeared to be much the same as they must have been when Monk's ships were repaired in their yards after his battles with De Ruyter. The following lines present to the mind a picture which must be familiar to the eyes of those who have dwelt upon the banks of Thames:—

> Some the galled ropes with dauby marline bind,
> Or sere-cloth masts with strong tarpaulin coats;
> To try new shrouds one mounts into the wind,
> And one below their ease or stiffness notes.

If we had a Dryden, he would not perhaps find insurmountable the task of poetically describing the coaling of a modern man-of-war. It would be indeed a bold effort of imagination to represent the Queen, or even the Prince of Wales, as looking on during the process. But, although Dryden's figurative expressions are out of fashion, the interest of Royalty in the prosperity of the navy is as great now as it has ever been, and the foundation of the Royal Naval College at Greenwich may be accepted as the latest proof of it. This College will be so organized as to provide for the education of naval officers of all ranks above that of midshipmen in all branches of theoretical and scientific study bearing upon their profession. The instruction given in the *Excellent* gunnery ship will continue as heretofore. This instruction was commenced in 1830, and was mainly due to the representations of the late Sir Howard Douglas, who had observed and strove to remedy that inferiority of English gunnery to which some of our failures in the contest with America were due. After a careful review of our naval actions with European enemies during the whole of the war from 1793 to 1815, and comparing them with the battles which were fought in the war which immediately preceded, Sir Howard Douglas found abundant proof that the navies of Europe had, in the later period, very much deteriorated in the practice of gunnery. In the later years of Napoleon's reign, though considerable improvements had been effected in the marine of France, the state of practical gunnery was very bad. The danger of resting satisfied with superiority over a system so defective as that of our principal opponents was soon made evident. We became too confident by being feebly opposed; then, slack in warlike exercises by not being opposed at all; and, lastly, in many cases inexpert for want even of drill practice. Herein consisted the disadvantage under which, without suspecting it, we entered in 1812 too confidently into war with a navy much more expert than that of any of our European enemies. It is a curious drawback from the received theory of human progress to be told that naval gunnery was better under Hood and Rodney than under Collingwood and Exmouth. After this we might almost be prepared to believe that the process of ship-calking when King Charles II. watched it and Dryden sang of it was done in a superior manner to anything that has been since seen at Deptford:—

> Their left hand does the calking-iron guide,
> The rattling mallet with the right they ply.

These lines are still applicable to many shipyards along the river, although in the Royal Navy iron has largely displaced wood. Our gunnery declined during the last years of the French war because the enemy seldom came out of port. There was partial inactivity during those years, and we have had much of the total inactivity of peace since. The danger that gunnery may deteriorate through want of actual practice in war ought, therefore, to be kept in view. Other branches of the seaman's art cannot easily fall into desuetude, because his most formidable enemies, rocks, shoals, currents, and storms, are ever ready to summon him to contest. In this respect the sailor enjoys an advantage over the soldier. A ship may be in danger at any moment, but it is difficult for an officer of the Guards to imagine himself liable to surprise as he leads his men in the early morning from barracks to the Park. The navy probably tends, as well as the army, to become more and more a scientific service. But there are many talents required in a good officer of which competitive examination affords no test. Here, again, there is a difference between the two services which is in favour of the navy. A bookworm might perhaps do duty irreproachably as an ensign, but if he went as midshipman in charge of a boat the crew would probably find him out. We do not assume the truth of the suggestion that recent accidents to ironclads are due to a decline of seamanship among naval officers, but it is at least certain that that quality could neither be acquired at a college nor tested by any system of marks. Let us not, however, appear on this account to undervalue the training which the Royal Naval College will supply. The vacant and often tedious hours of a sailor's life cannot be better occupied than in some branch of scientific study. The Board of Admiralty desire, by the establishment of the College, to give to the officers of the navy every possible advantage in respect of scientific education, but no arrangements will be made that may prejudice the all-important practical training in the active duties of their profession. This is as it should be. Prudent people begin to doubt whether Indian administrators can be successfully selected by examination, but it is beyond question that captains of men-of-war cannot. Among the subjects of study at the College will be naval architecture, metallurgy, civil and hydraulic engineering, maritime law, naval history, tactics, and hygiene. It is hardly possible that a naval officer can know too much of any of these things. Nautical astronomy, steam, and surveying may be described as necessaries, while modern languages and fortification are perhaps luxuries. Yet, in the infinite variety of positions in which a captain of a man-of-war may be placed, there is hardly any branch of knowledge which he may not find useful. A party of seamen may be landed, and it may be desirable that they should entrench themselves, for which a slight acquaintance with military engineering would be valuable. The adventures of Captain Marryat when he served on the Spanish coast under Lord Cochrane have been described many years ago in fiction, and quite recently in biography. That sort of service exercises every talent and accomplishment that a sailor may possess. Lord Cochrane was a remarkable example alike of natural ability and acquired knowledge. The latter is much more plentiful in our navy than it used to be. Let us hope that the former will not be wanting in time of need.

HOW THE FRENCH MAKE FOWLS PAY.

IT appears from official figures that between five and six hundred millions of eggs, to say nothing of thousands of tons of poultry, are annually imported into this country from France; and this has naturally suggested an inquiry as to what our own fowls are about. Where are our hens? asks the *Times*. It is clear that there is a ready and profitable market for eggs, and that an enormous supply comes from abroad, part at least of which might as well be produced at home. Whether regarded as an article of food or of commerce eggs are certainly not to be despised. At a time when the high price of butcher's meat drives ordinary folks to cast about for partial substitutes, it should not be forgotten that this country has hitherto neglected the means of supplying itself with poultry and eggs. We may reasonably shake our heads when it is proposed that perch and tench and other pond fish should once or twice a week fill the place of beef or mutton at tables that can ill afford to pay a shilling or fourteenpence for a pound of meat; but an important addition would be made to our resources if we could obtain a plentiful stock of eggs and poultry. *How the French make Fowls Pay* (Bosworth) is the title of a pamphlet by Mr. Kinard B. Edwards, which is now before us, and which contains much useful and interesting information on the subject.

It is apt to damage a good cause to pretend to excessive minuteness and exactness in figures which the experience of others may prove to have been assessed too low; and therefore we do not ask our readers to take too strictly the estimate of a chicken's cost after the first four months at a penny a week, especially as some authorities set it at fourpence, and the probability is that truth lies between the two. But, with a fairly wide margin, it will be seen that Mr. Edwards's plan will abundantly repay the pains and care which in this industry are after all the most appreciable part of the outlay. The success of the French results from the care which they bestow on early hatching, early killing, liberal feeding, and a supply of stimulating food both for fatteners and layers, with a view to the production of eggs and flesh at the quickest rate and the cheapest cost. They select the best breeds for laying or quick growth; they keep their stock always young; they go on the principle that regular production of eggs and flesh depends upon the sufficiency and the character of the keep; and they manage to avoid disease by quickly realizing and by a constant succession of stock. With us the usual management of the poultry-yard is "barn-dooring," all higgledy-piggledy, with no regard to times or seasons, to foods or to breeds. And thus it happens that pullets, because not hatched at the time which is essential to their becoming early profitable, average ten months of unprofitable feeding before making any return in eggs, and then only half repay us, because ill and irregularly fed, and because they do not take to laying till the season when eggs are cheapest. The rule should be to hatch pullet chickens in March or early April, as then, with due encouragement and stimulus in food, they will begin to lay at six months, or in the case of Hamburgs at five months, and go on doing so through the winter, when eggs are dearest and scarcest. The earlier chickens are hatched the better they thrive, getting over their moult in the warm weather, and having the summer to hasten them to maturity. So, too, unless cockerel chickens are hatched in early spring, they involve a loss of time and a cost of keep which does away with profit. Unless ready to kill about harvest, they do not improve in winter. They eat more as they get older, and at nine or ten months old their keep has exceeded their price in the market. But the systematic poultry-breeder will have his cockerels early hatched, and ready to kill at four months, up to which time they will have cost little to keep and will be plump and well shaped, the very opposite of the lean, lank, poor-breasted older fowls which are the result of a ruinous procrastination and want of forethought. It seems to be a golden rule in fowl-keeping never to keep old fowls. They take as much food as the young, and even more. They cannot lay in the moulting season, which goes on later, and is more severe every year; and they will give few, if any eggs, through the winter. Their flesh, too, is of little value—certainly of less value than that of younger birds.

In regard to the profits derivable from timely pullets and cockerels Mr. Edwards's statistics are very fascinating. Though he cites, in common with Stephens and other most respectable authorities, Mr. De Sora's egg-producing establishment near Paris, which was said to produce an average of 300 eggs per annum from each fowl—but which unfortunately was proved by Mr. Tegetmeier to exist, if anywhere, *in nubibus*—we are glad to see that he proceeds upon the more moderate computation that a pullet from beginning to lay should give 186 eggs in the next twelve months, or, at an average of *1s. 2d.* a dozen, a total of *18s. 1d.* At this point, and before moulting, he would coup and fatten her with barley or other meal and potatoes, moistened with milk, for a fortnight, and dispose of the carcase, which he calculates to weigh 4½ lbs., at *6d.* a pound. Thus it makes room for younger pullets, saves the cost of two or three months' moulting-time and of the winter season, and, according to a profit and loss account brought out in p. 7, will leave its owner the better by *16s. 6d.* Suppose, however, that two-thirds of this sum were netted, the result would have amply repaid the care and pains expended. In p. 8 again the profits of each cockerel are shown to be about *2s. 6d.*, or 100 per cent. on the trifling cost of the egg and the chick up to four months; and it should be observed that this early realization admits of one, if not two, successions during the summer.

But a vast deal depends upon good breeding and liberal feeding, as also on comfortable housing. To take the feeding first, Mr. Edwards maintains, from personal experience, that he has kept a hundred fowls on a weighed and measured allowance of a penny-worth of food a head per week, and that these fowls were in laying condition and perfect plumage. Averaging wheat, barley, oats, maize, and buckwheat one with another, and laying in a supply of broken rice, potato siftings, bullock's liver, and sheep's pluck, he can accomplish this at the price named; and it seems a good hint to any one who has a spare acre of poor soil, to grow buckwheat, which will yield forty bushels to the acre. As it contains a good deal of spirit, and is therefore stimulating, it is a famous poultry food abroad. To promote winter laying, a fixed morning, mid-day, and evening meal, the first and third of grain, the second of cooked vegetable and animal food, should be given with the utmost regularity; and although such regularity would seem to be just the difficulty about the whole matter, it is surely worth an effort. In spring and summer, of course, the fowls do much towards feeding themselves, especially if they have an extended run; and if to the diminution of the cost of keep were added the scavenger's work they thus perform, perhaps the balance would be even more satisfactory. A great deal, however, depends on keeping the pullets warm in winter; indeed warmth and cleanliness are the requirements that make assurance of profit from liberal feeding doubly sure, instead of being lost labour. The success of the Irish poultry, from puny breeds and deteriorated stock, bred "in and in," is as much owing to the warm housing as to the milk and the "praties." Laying hens want warmth inwardly and outwardly in winter to make up artificially for the carbon which then goes to supply the frame with heat, instead of to produce, as in summer, fat and eggs. This warmth, at least the external warmth, may be given by a circular stove costing *12s. 6d.*, as easy to carry as a stable bucket: and, fed with coal-dust at a very low cost per day, it will heat the fowl-house and the pigeon-loft, and ensure the uninterrupted production of eggs. In a very useful appendix, sold separately or with Mr. Edwards's pamphlet, will be found designs for fowl-houses, suitable to the means of the "million" or of the middle class. The cheapest, but far from the least useful, is a "ready-made fowl-house," made out of a large dry-goods hogshead, four feet in diameter, which we are told can be got at a grocer's for *1s. 3d.* The top is knocked in, a couple of perches are fixed inside, and a lattice-door of laths completes a fowl-house to hold six or eight hens and a cock, with nests underneath it, and with the advantage of being snug in winter, and moveable by rolling.

We have yet to consider how best to fill the fowl-house. For table-purposes, the Brahmas alone, or the Brahmas crossed with the Dorking, surpass all other breeds. The fault of the Dorking is its variableness in laying, its requiring a dry soil to thrive upon, its dislike of confinement, its tendency to degenerate from in-breeding, and the difficulty of rearing its delicate brood. But the cross with the Brahma gives size, flavour, and constitution, and produces the best of egg-layers. The Brahma, too, has that which the Cochin fowl lacks—an ample breast; it forages cleverly for itself, and though fond of liberty and roaming, will bear confinement well, and is a good sitter and a good mother. The Brahma may be said to be the most popular fowl of the period, taken all in all. For delicacy of flavour and precocity in fattening—a point of the utmost consequence in the matter of profit and loss—no fowls can beat the Houdans and Crève-cœurs, the former of these combining size and excellence of flesh with egg-producing powers of a high order. But these gain size and strength of constitution for our climate if crossed with a Brahma sock. For quantity and quality, though not size, of eggs none can beat the Hamburgs. Though not inclined to sit, the Silver Hamburg has the name of being an "everlasting layer"; and it is suggested by Mr. Edwards that for increased size it may be advantageously crossed with the Houdan Cock. Brahmas and Cochins are good layers, specially in winter. Polish and Spanish are good summer layers. On the whole, for aptness to live by foraging, for hardihood, the production of eggs, and suitability for the table, Brahmas, Houdans, and Hamburgs are most to be commended. And it is wise, we think, to limit oneself to three breeds at most, so as not to risk deterioration, or intermixture, through too many sorts.

For procuring eggs for hatching to start with, it is best to apply where known good stock is kept, and Mr. Edwards suggests that there should be a guarantee that at least one half of the eggs shall prove fertile. It is advisable to hatch more cockerels than pullets, because of the greater profit in fattening, through their hardiness and extra size; and the way to know the eggs which will produce this sex has been familiar as far back as Columella's day—to choose pointed-end eggs, not those which are roundish; noticing also the position of the air cavities, which in the case of a cockerel will be at the apex of the blunt and larger end, and not towards the side. In hatching eggs for egg-producing, we must select eggs from proved good layers; egg-laying being a speciality of particular birds as of particular breeds. For successful hatching of fowl and duck eggs Mr. Edwards recommends a few full-feathered Cochin hens, which at this work are in their chosen element. As to ducks, this is by far the best plan. Mr. Edwards has something to say about patent mothers and incubators; but this is, we find, more fully discussed in a separate appendix. On this point we should be disposed to listen rather to the practical views of Mr. Tegetmeier, who in his first edition of the *Poultry Book* described some of these contrivances; but in his second, which is in course of publication, omits all notice of them. "That chickens," he writes, "may be hatched by an incubator, we do not deny; we have seen scores so produced, but practically these contrivances are all failures. No artificial incubator can for a moment compare in its results with the natural one. A hen costing under five shillings a year to keep will bring out two clutches of chickens annually, rear them much better than any artificial mother, and give a return of seventy or more eggs as interest for the money expended. We know of no other incubator to equal her, either in the economy of working or the results." This being the case, we do not see why, leaving incubators out of the question, there is any need to train capons to the task of brooding and rearing. It will be seen that Mr. Edwards's pamphlet deserves attention. He shows what may be done with a hitherto neglected source of income and profit, and how this country may be made more independent of its Continental neighbours in regard to a valuable element of our food supply.

REVIEWS.

HISTORICAL ATLASES.*

OUR first impulse on seeing these instalments of two separate works lying side by side before us is to ask, Why are they not one work instead of two? We have for years made use of Spruner's three atlases, and we have ever and anon been seized with a desire to pull them in pieces and bind them up again after an order of our own. That is to say, we have always longed to throw the three into one, to put all the maps of Italy, Gaul, or any other country, one after another in unbroken chronological order, without troubling ourselves about *Atlas Antiquus*, *Mittel-alter*, *Aeusser-Europa*, or any divisions of the kind. Here is, thanks to the labours of Dr. Menke, an admirably enlarged and improved edition of that part of Spruner's work which takes in the mediæval and modern history of Europe—we should perhaps rather say of the Mediterranean world, as those parts of Asia and Africa which could not well be kept apart from Europe in an historical survey have always been taken in. But why is not the other part enlarged and improved also? The "ancient" part needed such enlargement and improvement at least as much as the mediæval part did. There is a great lack in the *Atlas Antiquus* of historical maps of Greece and Italy. To be sure for Greece the lack is in some sort supplied by Kiepert's *Atlas von Hellas*: but then that is a separate book, and we should like to have it all in one book; and even in using Kiepert's maps we are sometimes greedy enough to wish for a map or two more than we have got. Now we get at the same time two atlases which, if they were only one instead of two, look very much as if they would supply all our wants; but unluckily they are two and not one, so we suppose that we must knock under for the present, and make the best use we can of what we have got.

Dr. Menke promises us ninety principal maps instead of Kiepert's eighty-one, and he also promises us 340 instead of 119 of those little maps at the side, showing the particular divisions at some particular moment without crowding up the map with many names, as well as plans of towns and of battle-fields, which are among the most useful features of Spruner's work. As yet we have only thirty-four maps out of ninety, and those are not put in their consecutive order, though the maps in the different parts as yet published have a certain relation to one another. One of the great gaps in Spruner's series is already filled up. In the old atlas the age of Justinian was most strangely neglected. There was no map to show the time when, after so many fallings away,

* 1. *Dr. K. von Spruner's Hand-Atlas für die Geschichte des Mittelalters und der neueren Zeit.* Dritte Auflage. Neu bearbeitet von Dr. Theodor Menke. Erste, zweite, dritte, vierte, fünfte, und sechste Lieferung. Gotha: Justus Perthes. 1871–1872.

2. *An Historical Atlas of Ancient Geography, Biblical and Classical.* Compiled under the Superintendence of Dr. William Smith and Mr. Grove. London: Murray. 1872.

the rule of Cæsar once more stretched from the Ocean to the Tigris. No time is more needful to be fully understood by those who are anxious to get any true general view of the history of the world; and hitherto the source which is really one of the best means for getting such a general view has failed us in this important point. The labours of Dr. Menke have now quite supplied this gap. We have a map of Europe at the end of the reign of Justinian, accompanied by a curious map of the religions of Europe as they stood at that moment, and we have other maps showing more in detail the immediate Eastern dominions of Justinian as they stood at that time. Maps of this kind are living things; they bring the real state of things before the eye in a way which mere words cannot do. A picture which shows us that in the year 560, Old and New Rome, Carthage and Antioch, Cadiz and Trebizond, still obeyed a single ruler, that the part of the Mediterranean coast which was not directly under the Imperial sway was a mere exception here and there, is the best of all antidotes to the conventional chatter about the Roman Empire coming to an end in 476. The only thing that we can suggest would be the leaving out of the word *Ost* in the phrase *Ost-Römisches Reich*, a name which Justinian would certainly not have acknowledged; and yet perhaps something may be said for the qualification, as tending to bring out the fact that it was now the New Rome and not the Old which was the centre of the Imperial power. Dr. Menke is also doing good service at the other end of his subject by bringing his painted history of Europe—for that is what an atlas of this kind really comes to—down to the very latest times. It was no fault of Spruner's if his atlas did not show the changes which have happened since it was made, but the changes which were then the latest were a little slurred over. There was, for instance, no map of Europe showing the boundaries as fixed by the Congress of Vienna. All this, and all that has happened since, is fully supplied by Dr. Menke. There is, for instance, a wonderful series of maps of Italy showing all the different changes from 1798 to 1866. The new maps show far more clearly than was shown before the successions of the queer little principalities and commonwealths which sprang up and sank again in the days of French invasion, and also the gradual steps by which the revived kingdom of Italy has grown to its present extent. We look at the map marked "*Italien* 1861-1866;" we remember the talk about freeing Italy from the Alps to the Adriatic; we see how far from the Adriatic the new frontier was fixed, and we see how well the little that was done was paid for on the other side of the Alps. The map makes all this alive in a way which nothing else can. But it is not only in the beginning and ending of his work that Dr. Menke has given us fresh lights; the Scandinavian and Slavonic countries, which were rather cut short in the old atlas, have now great attention paid to them. There is a series of maps illustrating the history of Poland which are almost as edifying as those which illustrate the history of Italy. There are the changes before the partitions began; there are the three partitions themselves; the Duchy of Warsaw as set up by the first Buonaparte; even the momentary extension of its frontier at the expense of Austria which was made by the valour of the Poles themselves. All these things are here clearly brought out; and these are just the sort of things which it is very hard to make people understand. Dr. Menke's maps might do a great service in these matters when ingenious literary gentlemen sit down at a moment's notice to throw off leading articles about Poland or anything else, without stopping to think that the words they use have had a dozen different meanings at different times. There are also a number of new maps of Spain; but these, though clearing up the relations of the various Saracenic and Christian States in the early middle age, hardly come home to us in the same way as either the Polish or the Italian series. There is, however, very great interest in the first of the series, which shows the Teutonic settlements in Spain and the fluctuations in the boundaries of the West-Gothic kingdom. Owing perhaps to Roderick the last of the Goths, we are apt to think of the West-Gothic kingdom as essentially Spanish, to forget that it was Gaulish before it was Spanish, and that the Kings of Toledo kept the Narbonese Gaul down to the time of the Saracenic conquest.

We turn to the first part of Dr. Smith's *Historical Atlas of Ancient Geography*, and our wish to have the whole thing in one is only strengthened by so doing. The two series seem as if they were trying to meet, and as if some unkind power stepped in to hinder them from meeting. Here are eight maps of Palestine at different stages, from the days of the Hivites and Amorites to the taking of Jerusalem by Titus. They positively ask to be joined on to Dr. Menke's map of Syria at the time of the Crusades, and its *Nebenkarte* which shows all the arrangements of the Frank kingdom of Jerusalem. We read of Kings of Jerusalem in the Book of Joshua and we read of Kings of Jerusalem again in the *Gesta Dei per Francos*; and the two ends of the cycle—if that be not a mathematical bull—seem to ask to be brought together. Here is a map of the Greek and Phœnician colonies—that is, a map of the Mediterranean lands in the earliest stage in which they are known to history. Our first thought is, Why is this not allowed to range with the other map of the Mediterranean lands which shows a stage when the Phœnician had passed away, but when we may say that Greece was still ruling under the name of Rome? The little patch of Hellenic civilization far away in the Tauric Chersonesos is shown in both, as indeed it might still be shown some ages later, and it seems as if it tied the two together. We have maps of Upper and Lower Italy, with a *Nebenkarte* of Southern Italy in the time of the Peloponnesian War, which craves for its natural fellowship with the kindred *Nebenkarten* of Italy during later wars. We have Gaul at the time of Cæsar; we have a larger map of Gaul, which very clearly shows the limit of the possessions which Rome held for a season beyond the Rhine and the Danube, while it marks more clearly than any map which we saw before how much of the lands on the left bank of the Rhine, which the Romans called Gaul, was even then already Germany. Such a map as this directly points its fingers—our zeal must be forgiven if it leads us into strong metaphors—in the direction of those maps of Gaul and Germany and their border lands which we feel sure that Dr. Menke is getting ready for us. While on this point we may remark that the Carolingian age is rather cut short in the original Spruner. There is only one very small *Nebenkarte* which clearly shows the Frankish dominions at their greatest extent in Merovingian times, and there is no map at all of the dominions of Charles himself, except the view of them in the one general map of Europe. We do not doubt that Dr. Menke will make all these things clear, and it will be well also to show all the divisions of the Empire, those which were only planned, as well as those which were actually carried out, in the days of Charles and of Lewis the Pious. This is of special importance, as these divisions show how utterly foreign to the mind of Charles was any geographical division answering in the least to modern France, and how the first idea of such a division, under its proper name of Carolingia, crept in by a kind of accident through one of the partitions made in favour of Charles the Bald. Then, as Dr. Smith so clearly gives us the bounds of the comparatively lasting Roman possessions in Germany, it would really have been a gain to have marked the extent of the momentary Roman occupations under Drusus, Varus, and Germanicus. But then we want all these things brought together in order, not one in one place and one in another. There have been three moments in the history of the world when the same power ruled at the mouths of the Elbe, the Garonne, and the Tiber. The result was indeed gained by three different processes. Under Drusus, the lord of Italy ruled over Gaul and for a moment over Germany. Under Charles, the lord of Germany ruled over Gaul and Italy. Under the elder Buonaparte, the lord of Gaul ruled over Germany and Italy. We ought, in a series of this kind, to have maps showing those three wonderful moments side by side, showing at once the physical likeness of the three periods in the boundaries as marked on the map, and their utter political unlikeness as shown in every detail within those boundaries.

Of the two sets of maps the German ones seem to us on the whole the clearest, and Dr. Menke has grasped the idea of an historical atlas more fully than Dr. Smith. In a series of this kind there ought not to be maps marked vaguely "Gallia" and "Italia" without any particular date. This is a survival—only a survival, but we are sorry to have so much as a survival—of the days of Bishop Butler (not of Durham) and such like, when we used to have one map to do from Adam to A.D. 476 or 1453—we are not sure which—and another from 476 or 1453 to the time when the map was drawn. All maps are somewhat trying to the eye, and the fuller, and therefore the better they are, of course the more trying. But the more strictly historical the series is made, the more easily we may get rid of the bad side of fulness by marking places in the maps when they were of importance and leaving them out when they were not. In Dr. Smith's series, the Jewish series, for which we suppose we have to thank Mr. Grove, strike us as the clearest. The Greek series are to our eyes comparatively indistinct. Both Atlases will be very useful as they are, but they would be more than twice as useful if they were rolled into one.

CUNYNGHAME'S TRAVELS IN THE CAUCASUS.*

INCREASED facilities for locomotion by land or sea have considerably widened the area of autumnal tours, and the qualification for entry into a well-known London club—that the candidate should have been five hundred miles from England—has long been merely nominal. The consequence of travelling made easy is that we have an abundant crop of vacation wanderings and summer trips. A well-known barrister gives us his experiences of the celebrated fair at Nishni Novogorod. Two or three adventurous young Englishmen stir the hearts of members of the Alpine Club by accounts of the ascent of Caucasian pinnacles hitherto only known to them by commonplaces from the Latin poets. Occasionally a lady invades the domain of masculine adventurers with pen and pencil, and describes Circassian scenery and Turkish harems with the grace, the ease, and the delicacy which characterize the volume published by Mrs. Harvey. But we have reason to know that this authoress obeyed the Horatian precept, and kept her manuscript locked up for seven, if not nine years. The multiplication of similar volumes, not always subjected to the same judicious ordeal, is a contingency for which we must be prepared; but, by complying with certain stipulations, travellers who rush into print with their experiences have no need to fear a rigid censorship. The conditions should be, however, carefully observed. The author should have something pointed, original, or interesting to tell, and he should endeavour

* *Travels in the Eastern Caucasus, on the Caspian and Black Seas; especially in Daghestan, and on the Frontiers of Persia and Turkey, during the Summer of 1871.* By Lieutenant-General Sir Arthur Thurlow Cunynghame, K.C.B., &c. Illustrated by Henry Hardinge Cunynghame, of St. John's College, Cambridge. London: John Murray. 1872.

to tell it with method, simplicity, and condensation. He should confine himself to topics connected with his calling and profession, if he cannot charm by style, or occupy regions wholly unexplored. We might, for instance, then look for speculations on the development of Russian commerce from a merchant; for a disquisition on the primitive simplicity of Turkish justice from a lawyer; for remarks on politics from a Secretary of Legation; for catalogues of fauna and flora from a sportsman or member of the Alpine Club; for depreciatory comments on Eastern agriculture from an M.P. who, like Tennyson's Baronet, is

> A breeder of fat oxen and fat sheep,
> A pamphleteer on guano and on grain;

and for the system of officering any foreign army in which purchase is unknown, and yet jobbery is not unfrequent, from a veteran who had served in the Crimean war and the Indian Mutiny. In short, if we are to have a succession of new "Ramblers" and "Idlers" at the close of every long vacation, we must stipulate for a careful avoidance of trite and familiar topics, for a wise retrenchment of superfluities, and for as much of artistic workmanship as can be attained by ordinary diligence and care.

The author of the volume before us is a soldier who has had considerable experience of active warfare and of foreign travel. He is also connected by marriage with a deceased veteran who had seen Moore fall at Corunna, and had helped Lord Gough to repel and defeat the Sikhs. Sir Arthur Cunynghame has fought at Inkermann, where he was Quarter-master of a division; has looked on the celebrated Porcelain Tower at Nankin; and, in India, has had under his orders such dashing leaders of irregular cavalry as General Probyn and Colonel Fane. We therefore have reason to welcome his recollections of Crimean battle-fields, and his military reconnaissance of the difficult mountain passes where Shamyl maintained his unequal struggle for years against the whole force of the Russian Empire. But one fault of the book is that it is much too long. At least eighty pages at the very commencement should have been entirely omitted. Vienna and the Danube, Varna and Bucharest, are well known, and there is nothing either so striking in Sir Arthur's adventures, or so suggestive in his remarks, as to detain us profitably among Wallachian scenery and Hungarian wines. The description of the Boulevards or of the opera at the Austrian capital might possibly be of service for the latest edition of Murray's Guide-books. An anecdote of a young English lady who, while at an hotel at Brussels, nearly killed herself by stepping on a skylight, is irrelevant and unnecessary; and we hardly require to be told that a well-known general in the Turkish service, unlike Mr. Vincent Crummles, was by birth a Prussian. But there is nothing tedious, and a good deal both valuable and animated, in Sir Arthur Cunynghame's remaining narrative. He took for his summer and autumn tour a country which in point of conveniences, civilization, and development, is about midway between the beaten track where any one tourist, like hundreds of others, is pillaged by innkeepers or "done for" by couriers, and those wild steppes in which tents may be assailed by brawny Bedouins, and the firman of a Pasha be no sort of protection against the requisitions of a tribe of nomads and plunderers. We are still within a region where, after dismal experiences of vermin and mosquitoes, crowded steamers, hard boards for sleeping couches, Russian tea-urns, and Tartar saddles, the author lands us at a capital which boasts of a museum and an opera house, a number of fine bridges, a Parisian milliner, and a street of European shops. Sir Arthur, as might be expected from his service and position, journeyed under the protection of commendatory letters; and difficulties about post-horses and vehicles and times of departure were smoothed away, as we were prepared to hear, when a Crimean veteran was introduced to Grand-dukes and generals who showed him even more than the usual courtesy and attention of old antagonists. It is true that the writer made no attempt to ascend Mount Ararat, like Mr. Freshfield, and that he only looked at the snow-capped summits of Kasbek and Alburz, or Elburz, which this latter gentleman successfully assailed. But he has the eye of an old campaigner and of a genuine sportsman for the geography of a wild and picturesque region; he can bear with equanimity the hardships and inconveniences of a journey where the traveller is jolted in vehicles without springs, or rides long distances on horseback; his pages are free from flippancy, and his self-assertion is never offensive; while the concluding chapters contain advice and information well calculated to inform intending tourists of the best time and mode to visit the country, whether the object be sport, adventure, political knowledge, commerce, or scenery.

The real interest of the trip commences with the departure from Constantinople. We should mention that Sir Arthur was accompanied by his son, an undergraduate of Cambridge; and the two, after visiting Odessa, Nicolaeff with its arsenals and Boulevards, Sebastopol and Kertch, and Taganrog, determined on ascending the Don by steamer, and then, taking advantage of a short railway which unites the above river with the Volga, they came down the latter stream and saw Astracan and a settlement of Kalmucks in the neighbourhood of that port. Thence they sailed down the Caspian Sea for two hundred and thirty miles, and entered Eastern Caucasus by the port of Petrolvks. From this point they visited Gunib in Daghestan, the scene of Shamyl's last struggle, Bodlith, Vladicavcas, Tiflis, and Erivan, with the convent at Etchmiasin in the vicinity; then descended to the frontiers of Persia, but, instead of going on to Tabreez, as did Mr. Freshfield and his companions, returned by Borjome to Poti on the Black Sea. Thence, by the Turkish ports of Batoum and Trebizond, the return was easy to Constantinople, and so by steamer to Trieste. The time spent in this journey was just four months, and the expense was under 140*l.*

We select from this volume a few of the topics which either have some interest in themselves, or which show the writer's power of observation. Russian farms are said to be enormous in extent, and one gentleman, apparently residing near Taganrog, was believed to have forty thousand acres under tillage. The typical Dorsetshire peasant might sigh or rebel if he knew that Russian labourers at harvest time received from eight to twelve shillings a day, and that withal the profits to the corn-grower were "enormous" whenever there was a bad harvest in Western Europe. Provisions in Daghestan are marvellously cheap. At Grosnia the best meat was threepence, and bread a halfpenny a pound; pheasants a shilling a brace, and partridges ninepence. Black grapes, at the same place, were not quite a halfpenny a pound. Georgian artisans must, however, have a good deal of the Asiatic in their character and mode of work, if the following anecdote can be implicitly relied on. An English carpenter was backed against four natives to work at turning out oaken posts. They began at six A.M., and in ten hours and a-half the Englishman had finished thirty-four, while the natives had only finished thirty-one. We confess to be haunted by an apprehension lest this result merely conceals a tribute to that national vanity by which, in Nelson's time, our grandfathers were taught to believe firmly that one Englishman could thrash three Frenchmen. The trade in walnut-wood has, by the way, been monopolized by a French firm or firms, and this material, shipped to Marseilles from the neighbourhood of Poti, enables the manufacturer to sell veneered and polished work at a vast profit. On the other hand, let no man excite envy and hate by using skilled machinery of which all that the native can comprehend is that he is thereby ruined. A gentleman whose name is concealed, and whose nationality is not quite clear, set up a steam saw-mill near Tiflis, and naturally displaced the old-fashioned saw-pits. The sawyers took alarm, and one day quietly burnt down the new workshop. In some points the position of the Russians in Georgia is not very unlike our own in India. They have a Governor-General in the shape of a Grand Duke, who holds his Court at a civilized capital, enjoys a salary about three times that of the Indian Viceroy, and retires to Borjome during the heats of summer, just as Lord Northbrook has done, and probably will do, to Simla. It is only two years ago that the great leader of the Circassian patriots died at St. Petersburg, where, like many an Indian pensioner or representative of dethroned majesty, he was living as a political prisoner under honourable surveillance. In spite of a strong military force capable of overawing disaffection and holding the country, mountaineers till lately made raids into the plains, and even now they steal horses from the camp. Officers stationed at Peshawur were recently subject to the very same visitations, but the English sentries do not retaliate by shooting the thieves, as, according to Sir A. Cunynghame, the Russian soldiers had done in Grosnia just before his arrival. The statement recently published by Mr. Palgrave as to the exodus of Mahommedans from the countries which have passed under Russian supremacy is fully corroborated in the book before us. Sir Arthur ascribes the migration, not to heaviness of taxation, but to hatred of compulsory service on road-making. Of the fact there there can be no question, and from this movement it is not unfair to infer, for Islam, a more complete union and a latent capacity to resist aggression. All that Sir Arthur Cunynghame says regarding the facilities of the Caucasian country for a patriotic struggle, the straits to which the Russians were reduced previous to the capture of Kars in 1854, and our faulty strategy at that very period, is clear, if it be not absolutely convincing. With reference to Shamyl's perseverance we may quote an anecdote, not generally known, which exemplifies the readiness of the Persians in sarcastic repartee. When the late Emperor of Russia was making a tour in Georgia so far back as 1837, a high Persian dignitary introduced the heir-apparent of Persia to the Imperial presence. In the course of conversation, Nicolas, with reference to the designs then entertained by Persia on Herat and Afghanistan, observed to the Persian Ambassador—"Who are these Afghans that they should be allowed to laugh at your beard? Whose dogs are they to stand in the path of Mahommed Shah?" "Oh," answered the Amir, "they are an insignificant set of vagabonds, not worth naming; idle, ungodly scoundrels, very like those Lesghies and Daghestanies you have in the mountains." This reply would have been not unworthy of Palmerston or Castlereagh. We give the story as it was current some years ago at Teheran, where, of course, it redounded to the national credit.

For those who, wearied with the sameness of English sport, are content to rough it on something less than steaks and porter, the Caucasus and the seas in its vicinity offer an untried field. There are magnificent forests, tempting swamps, fine streams, and rocky defiles, with snowy ranges in the distance. Besides abundance of small game, the ibex is found at great heights, and deer of several kinds and wild boar can be had along the slopes and in the forests. Pheasants swarm in one tract: snipe and woodcock in another; wild-fowl in a third. The rivers are said to contain trout and salmon, or rather what appeared to General Cunynghame, by description, to be a species akin to the mahseer of India. Tourists and sportsmen will, however, recollect that the chase in these localities can only be followed by those who can live in small tents, who can bear alternations of sharp

cold and steamy warmth, and who will take due precautions against ague and jungle fever. The volume is enriched with twenty-eight excellent illustrations from the pencil of the author's son. They deal with a variety of subjects ranging from an Armenian church and a Mohammedan mosque to views of the deserted Sebastopol and the ruined Malakoff. We are bound to say that they evince very considerable artistic talent, and that the mountain scenes may fairly bear a comparison with the illustrations of Mr. Freshfield's work. In both instances Mr. Edward Whymper appears to have given his assistance to set off the rough materials of the artists to the very best advantage. One engraving at page 75 deserves a special mention. It is that of the brazen serpent from Delphi, afterwards in the Hippodrome at Constantinople, and now enclosed by a wall. We may be excused for reminding our readers of a summary of the historical evidence of this remarkable relic, as given by Gibbon in one of his pithy and incisive notes:—"The bodies of three serpents are twisted into one pillar of brass," says the historian in his text, and "their triple heads had once supported the golden tripod which, after the defeat of Xerxes, was consecrated in the temple of Delphi by the victorious Greeks." Then, in the note, we are told that the consecration of the tripod and pillar may be proved from Herodotus and Pausanias; that the Pagan Zosimus agrees with three ecclesiastical historians, Eusebius, Socrates, and Sozomen, in stating that the ornaments of the temple were removed to Constantinople by Constantine; that, amongst them, the serpentine pillar of the Hippodrome is particularly mentioned; and that all modern travellers, from Buondelmonte to Pocock, describe it as in the same place and in the same manner. Of course Gibbon could not refrain from remarking that the guardians of the most holy relics would rejoice if they could produce such a chain of evidence. A reference to the above passage would have been of service to readers who have forgotten Gibbon or had not the book at hand. But we shall be surprised if this tour, following on that of Mr. Freshfield, does not tempt several adventurers during next autumn to explore the defiles of Georgia, to test the respective merits of a Telega and a Tarantasse, to climb a glacier, to stalk an ibex, and to pay a visit to places so well worth seeing as Tiflis and Erivan.

SHELLEY'S EARLY LIFE*

MR. MAC CARTHY says in his preface that he ventures to offer this book to the public "as an honest contribution to those authentic materials out of which, sooner or later, a thoroughly trustworthy life may be written of Percy Bysshe Shelley." So much may be granted without hesitation. Mr. Mac Carthy has industriously gone over the early part of Shelley's life; he has carefully investigated the statements which have hitherto passed current with biographers; he has detected many errors; and he has discovered a few new facts which will have to take their place in future lives of Shelley. At the same time the book is interesting rather to Dryasdust than to the general reader. It is more in the nature of a running commentary upon previous writers than of an independent work. Mr. Mac Carthy does not attempt to construct a portrait from the materials which he has collected, and, to say the truth, the book, though short, is rather tiresome even to an admirer of Shelley. Few writers, indeed, could throw a charm over an elaborate discussion of petty details and exposure of the petty errors of their predecessors; and Mr. Mac Carthy is no exception. We fear, too, that his merits as an investigator are limited to industrious and accurate research. We are compelled to dissent from the inferences which he draws from his facts, though we cannot but be grateful for the pains which he has taken in providing us with the necessary data for forming our own opinion. Without following him into his various attacks on the accuracy of previous writers, and especially of poor Mr. Hogg, of whom he speaks with special indignation, we will briefly consider the two main discoveries which Mr. Mac Carthy conceives himself to have established.

The first of these is that Shelley wrote a poem which has completely disappeared, and of which the very existence has never been previously recognized. The evidence on the subject may be briefly stated. During Shelley's brief visit to Ireland, of which Mr. Mac Carthy has given a fuller account than had hitherto been published, an article appeared in the *Weekly Messenger* which, after an elaborate eulogy of Shelley's many virtues, concludes in these words:—"Mr. Shelly (*sic*), commiserating the sufferings of our distinguished countryman, Mr. Finerty (*sic*), whose exertions in the cause of political liberty he much admired, wrote a very beautiful poem, the profits of which we understand, from *undoubted* authority, Mr. Shelly remitted to Mr. Finerty; we have heard they amounted to nearly a hundred pounds. This fact speaks a volume in favour of our new friend." Finnerty had been imprisoned for eighteen months for a libel on Lord Castlereagh, and subscriptions had been opened on his behalf by Sir F. Burdett and other Radicals of that day. Mr. Mac Carthy has discovered Shelley's name put down for a guinea in a list of subscriptions in the *Oxford Herald*; the trial having occurred during Shelley's brief academical career. In the next number of the same paper —namely, on March 9th, 1811—is an advertisement of "A Poetical Essay on the Existing State of Things," by "A Gentleman of the University of Oxford." The essay is described as just published, its price is two shillings, and it is said to be for Finnerty's benefit. A motto is added from Southey's *Curse of Kehama*. Advertisements of the same poem occur in the *Morning Chronicle* of March 15th and 21st, and in the *Times* of April 10th and 11th, 1811. These are all the explicit references to the poem. Shelley himself nowhere speaks of it, unless it be identical with an "Essay on Love," mentioned in a letter to Godwin of January 16th, 1812. The word "essay," says Mr. Mac Carthy, "gives great probability to this supposition." We confess that no two subjects seem to us more unlikely to be confounded than "love" and the "existing state of things." However, our readers can judge for themselves. The only remaining fact bearing on the question is that Shelley sent to Godwin the article from the *Weekly Messenger*, but made no special reference to the statement about the poem. Mr. Mac Carthy infers that the statement must have been true. On the other hand, he admits that Leigh Hunt, who took a particular interest in Finnerty, and who afterwards became intimate with Shelley, says nothing about it; that no reference is ever made in the many subscription lists published to any sum received on account of the profits, and that Mr. Finnerty's relations knew nothing of it. "It is incredible," however, that Mr. Finnerty "would not have contradicted this statement of the presentation to him of the profits of a poem if it were not true." Still Mr. Mac Carthy admits the subject to be "full of difficulties."

That such a poem was published is probable enough. Indeed the advertisements quoted seem to prove it beyond all reasonable doubt. The one singular statement is that the profits were nearly 100*l.*, and indeed this statement is so singular that we altogether decline to believe it. The argument from the silence of Shelley and of Finnerty is palpably worthless. Shelley may have been silent because Godwin knew the statement to be false, as well as because he knew it to be true; or he may have overlooked it, or thought it unimportant; or he may have forgotten to notice it, when writing in a hurry; or he may even have regarded it as a pious fraud likely to be useful to the cause. Mr. Finnerty may have been a good man and a true patriot; but such is the weakness of human nature that political agitators, even when they are Irishmen, frequently forget to contradict inaccurate statements calculated to help their agitation. Meanwhile the reasons against accepting the assertion are obvious. In order to make 100*l.* by a poem sold for two shillings, it is plain that, even if we should assume that the poem was published for nothing, and that the author received the whole retail price, a thousand copies must have been sold; for a thousand times two shillings only makes 100*l.* Now, as these assumptions are manifestly extravagant, as is known to every body who ever published or bought books, we may safely say that to produce 100*l.* profit the poem must have gone through two or three editions. We may take a case which is oddly parallel. Goldsmith's *Deserted Village* was sold for two shillings; it went through five editions in less than three months; and there is a story—not very authentic it is true—that Goldsmith, on being offered 100 guineas by the publisher, refused it, as manifestly more than the poem could produce. Goldsmith knew as well as any one that publishers might be trusted not to ruin themselves by extravagant liberality to authors. It appears, however, that he received less than 100*l.* for the poem. Now, if Shelley forty years afterwards received nearly 100*l.* for a poem sold at the same price, we may fairly infer that it must have had a very large sale. In that case it would clearly have been advertised more than four times; it would, moreover, have been a perfectly unique case in Shelley's literary career, for even his best poems never obtained quick popularity; and, finally, it is impossible to believe that it could have utterly disappeared from the world, so that its very existence should have been forgotten for sixty years. Shelley would probably have mentioned it; and undoubtedly some of his admirers would have preserved it. The whole story, indeed, is so wildly improbable that it may be dismissed without further argument. We will merely add that, as Mr. Mac Carthy is constantly boasting of his accuracy, he should not have used the phrase, the poem "is said to have produced the sum of 100*l.*" It is only said to have produced "*nearly* 100*l.*"; and even this statement is introduced by the phrase "we have heard"; whereas the preceding sentence, stating that the poem was published, speaks of knowledge "on undoubted authority." The difference is significant.

The facts, as we should guess, are something of this kind—Shelley published a poem for Finnerty's benefit. Like his other early poems, it was probably trash; for few literary facts are more curious than that Shelley, who produced some of the finest poetry in the language before he was thirty, had written nothing but masses of rubbish, even on the showing of his most devoted admirers, till he was past twenty. Unlike Milton, Pope, and Keats, his early writings show scarcely a touch of his future genius. The poem did not sell; there were no profits, and Finnerty got nothing by it. But an Irish editor "had heard"—not a very unprecedented phenomenon—a totally inaccurate report about it, and neither Shelley nor Finnerty took the trouble to contradict him.

The second discovery made by Mr. Mac Carthy is that Shelley was potentially a great orator. It is known that whilst in Dublin he made a speech at a public meeting. Mr. Hogg says that it was a failure. Mr. Mac Carthy calls this a "reckless misrepresentation." He says that a witness, of whom we shall speak directly, "bears the most unequivocal testimony to the eloquence of the young

---

* *Shelley's Early Life.* By Denis Florence Mac Carthy. London: J. C. Hotten.

speaker," and declares this testimony to be "decisive as to the probabilities of Shelley's success as an orator had he devoted himself to a political career." We do not call this a "reckless misrepresentation," for we are convinced that it is an excusable mistake; but we suspect that Mr. Hogg's account is far nearer the truth than Mr. Mac Carthy's. We will briefly give the evidence on the subject.

The speech is reported in three newspapers; all the reports are very brief; one says that "Shelley was received with great kindness"; and another mentions "loud applause for several minutes," as following Shelley's opening statement that as an Englishman he blushed for the crimes committed by his nation in Ireland. Besides this are two reports from persons employed by the police, and preserved in the Record Office. One of these is verbatim, as follows:—"Lord Glentworth said a few words, a Mr. Bennett spoke, also Mr. Shelley, who stated himself to be a native of England." The other does not even allude to Shelley. It mentions, however, a speech by "Mr. Wise, a young boy," as "of considerable length and replete with much elegant language." Shelley's speech, Mr. Mac Carthy thinks, has here been inadvertently given to Mr. (afterwards Sir Thomas) Wyse, the late English Ambassador in Greece—first because "a young boy" refers better to Shelley, who was only nineteen and a half, than to Wyse, who was twenty-one; and, secondly, because the account does not apply in some respects to the fuller reports of Mr. Wyse's speech. At most, however, this is a highly conjectural statement, and we have more direct testimony at hand. The late Chief Baron Woulfe, who heard him, described him in terms which, as Mr. Mac Carthy says, leave the impression that he was "a cold, methodical, and ineffective speaker." The description was given a considerable time afterwards, and when the describer was in bad health. Still, so far as it goes, it is direct testimony. Shelley, however, is the best witness himself. The impression made upon him by his own performance is shown in this passage from a letter:—"My speech was misinterpreted. I spoke for more than an hour. The hisses with which they greeted me when I spoke of religion, though in terms of respect, were mixed with applause when I avowed my mission. The newspapers have only noted that which did not excite disapprobation."

This testimony seems to us to be conclusive. Shelley evidently felt that he had made a failure. No young orator ever wrote in such terms after his first triumph in moving an audience. The newspapers in favour of his party naturally softened his want of success; but an orator knows when he is applauded, and Shelley clearly felt that he had not met with genuine sympathy. Mr. Mac Carthy, however, thinks that he has "decisive" evidence to the contrary. The witness to whom we have already referred is a certain anonymous "Englishman," who describes the speech in a letter to the *Dublin Journal*, which was then, we presume, a Government organ. He says that he was disgusted to "observe with what transport the invectives of this renegade Englishman against his native country were hailed by the assembly he addressed. Joy beamed on every countenance, and rapture glistened in every eye at the aggravated detail; the delirium of ecstacy got the better of prudential control; the veil was for a moment withdrawn;" and in short, the "Englishman" saw that the audience, though the orator spoke only of emancipation, thought of "separation and ascendency."

Mr. Mac Carthy, with all his pretensions to accuracy, calls this a description of Shelley as an orator, and says, as we have seen, that the letter bears unequivocal testimony to the young speaker's eloquence. Yet there is not in the letter a single word about Shelley's eloquence; and everything that is said is perfectly consistent with the newspaper reports, with Shelley's own letter, and with Chief Baron Woulfe's account. To what does it really amount? Simply that when Shelley, introduced as an Englishman and the son of an English member of Parliament, abused England for its injustice to Ireland, Irishmen applauded warmly. Does that imply that Shelley was an eloquent speaker, or that he would certainly have succeeded if he had adopted a political career? We will venture to say that the worst orator in England at the present moment might produce enthusiastic cheers by denouncing English injustice to Ireland at a Home Rule meeting. The "Englishman" and the papers alike suppress the fact that he was afterwards hissed for attacking Catholicism; the papers because they were on his side, and the "Englishman" because his only object seems to be to prove the disloyalty of the Irish. Shelley may or may not have had a potential orator within him; but we hold it to be quite clear, in spite of Mr. Mac Carthy's assertions, that he did not prove it at this meeting in Dublin. Mr. Mac Carthy's judgment on this matter is only on a par with his notion that Shelley showed political wisdom because he was more sanguine than Godwin as to the result of an agitation for Roman Catholic Emancipation and Repeal of the Union. Nobody else can read the story without seeing one more proof of the singular immaturity of Shelley's mind at this period of his life, and of that curious incapacity for dealing with the things of the every-day world which marked him throughout his career.

We shall not, however, investigate any more of Mr. Mac Carthy's statements. He has proved, as we think, that Shelley published a poem which is lost, and which probably deserved to be lost. He has found some additional evidence about Shelley's single speech; but, though he does not himself admit it, we think that he has only confirmed the substantial accuracy of Hogg's account. Whether Shelley might have been a good orator, and whether he may have added one more poem to the quantity of bad juvenile verses already known, are matters of no great importance; but biographers are an omnivorous race, and Shelley's biographers in the future will have to read Mr. Mac Carthy's pages and be grateful for his industry, if not for his acuteness. We will add that the two rare pamphlets which Shelley printed at Dublin, and two others almost equally rare published at Marlow, are also reprinted here for the benefit of the curious students of the bad writings of good authors.

DESCHANEL'S ELEMENTARY PHYSICS.*

THE value of Professor Deschanel's *Traité élémentaire de Physique*, published five years ago, has been amply recognized in his own country. It has been already adopted by the Minister of Instruction as the text-book upon the subject for Government schools. Systematically arranged, clearly written, and admirably illustrated, showing no less than 760 engravings on wood and three coloured plates, it forms a model work for a class in Experimental Physics. Far from losing in its English dress any of the qualities of matter or style which distinguished it in its original form, it may be said to have gained in the able hands of Professor Everett, both by way of arrangement and of incorporation of fresh matter, without parting in the translation with any of the freshness or force of the author's text. By the side of M. Guillemin's treatise which we noticed a few weeks back, and which goes over much the same ground, with a very similar distribution of subjects and an interchange of a large number of the same woodcuts and coloured engravings, M. Deschanel's volume may present a less attractive style of getting up as a drawing-room work—especially in the absence of the exquisite chromatic scales which so happily set off the *Forces of Nature*. But, appealing as it does to a more advanced class of readers, it goes at most points far more deeply into the truths of physics than M. Guillemin's manual, and is marked by greater exactness of treatment. The introduction of algebraic formulæ, without exacting any more severe exercise of thought than is involved in the differential and integral calculus, is of great value as giving the student a firm hold of those analytical processes without which no really scientific knowledge of nature is to be had, and in the use of which the science of modern days possesses an organon of inquiry wondrously in advance of that wielded by the geometricians of old time. In not a few instances the English editor has had it in his power to simplify or make clear the mathematical formulæ or proofs laid down by the author, as well as the statements of fact or chains of reasoning upon which later observation or more critical inquiry could be brought to bear. We miss from the edition before us the collection of problems, chiefly taken from the examination of the Faculty of Sciences in Paris for the bachelor's degree, which still stands as part of the programme of what is promised us in the author's preface. The insertion of these would have been welcomed, if for no other purpose than that of enabling us to compare the educational tests in use amongst our neighbours with those familiar to us at home, and to form a clearer estimate of our respective methods of scientific training.

In other respects every change has been, on the whole, on the side of decided gain to the English student. Quantitative statements of weights and measures have in general been expressed in British units, though in many cases the numerical values given in the original in terms of the metric system have been retained, with or without their English equivalents, as being extensively in use among men of science in all countries, besides affording peculiar facilities for scientific calculation. A complete table of metrical and British equivalents makes comparative reference at all times easy. Many additions have been thought to be called for by the special exigencies of physical education, or the course of philosophical discussion in this country, or, above all, by the advance which may here be fairly claimed in certain departments of experimental science. The strict and accurate method of treating electrical subjects which has been established among us by Sir W. Thomson and his coadjutors has not yet, as Professor Everett with justice pleads, been adopted in France, nor does the whole of Faraday's electro-magnetic work seem as yet to be thoroughly appreciated by French writers. A considerable portion of the third part of the present work has accordingly been recast, and two original chapters added, with an appendix upon electrical and magnetic units, making this the most complete and valuable part of the book. The former of these new chapters relates chiefly to "electrical potential and lines of electric force," of which no mention whatever is made in the original work; the second is descriptive of various kinds of electrometers, by means of which potential is measured. The elements of this branch of electrical theory are largely drawn from Professors Thomson and Tait's *Natural Philosophy*, and from the papers of the former able writer in the *Philosophical Transactions*. The reader will be prepared for this onward step in physical philosophy if he has carefully run up the preceding chapters on electrical induction, the duality of electricity, and the laws of attraction and repulsion, with the methods and results of measurement laid down by Coulomb. The law of inverse squares is rigorously verified by the experiments of Biot

* *Elementary Treatise on Natural Philosophy.* By A. Privat Deschanel, formerly Professor of Physics in the Lycée Louis-le-Grand, Inspector of the Academy of Paris. Translated and Edited, with extensive additions, by J. D. Everett, M.A., D.C.L., F.R.S.E., Professor of Natural Philosophy in the Queen's College, Belfast. London: Blackie & Son. 1872.

and Faraday, showing that electricity resides only on the external surface of a charged conductor, there being at the same time no electrical force in the space enclosed by this surface. Faraday even tested this fact by himself entering a cubical box charged by means of a powerful electrical machine, Biot having shown the same law to hold good in a hollow sphere. Now if the conductor be a sphere removed from the influence of external bodies, its charge must be distributed uniformly over its entire surface. Mathematical proof can thus be adduced to show that the fact of a uniform spherical shell exerting no attraction at any point of the interior space holds good in the case of the law of attraction being that of inverse squares, and in no other—the law, we need scarcely say, which governs universal gravitation. A series of experiments with the sphere, the ellipsoid, the cylinder, and the disk makes it clear that the distribution of electricity on the surface of a conductor is independent of the amount of charge, and is determined simply by the form of the conductor. The dissipation of electrical charges is found by experiment to follow the same law as that deduced by Newton for the operation of cooling in heated bodies, the rate of loss being simply proportional to the charge.

Although the great charm of the book lies in the clearness and vividness of its illustrations, which serve the reader to some extent in as good stead as the experiments of a laboratory, it is of even higher importance to him to reach in succession such points of generalization as those which we have selected for notice. In the absence of definite ideas as to what electricity is in itself, the best we can do is to lay down distinct and positive data along the line of progress, and, amid so much that is unavoidably empirical, to grasp wherever it is possible such truths as seem to be brought within the scope and the processes of exact science. How much has been done by way of mathematical deduction from such laws as that of the inverse squares may be seen in the case of lines or "tubes" of force, briefly explained by Professor Everett. It is deeply interesting to observe, as an instance of the harmony or unity which pervades all the forces of nature, the analogy which holds good between the intensity of force in a "tube" or flow of electricity bounded by imaginary lines and the velocity of a body of liquid in its passage through a tube or elongated channel. The product of area by velocity is the volume of liquid which flows past any section in the unit of time. Lines of flow are thus the analogues of lines of force. Lines of force are also proved to be the lines along which induction takes place, the total quantities of inducing and induced electricity being in every case equal, and of opposite sign, positive or negative. Coming at length to the relation between potential and work, we get the definition of the resultant potential at any point due to several different quantities of electricity, as $\Sigma \frac{q}{r}$, or the algebraic sum of the potentials due to the different quantities separately considered, $\frac{q}{r}$ being the whole work done by or against the force of an element q, in bringing a unit of electricity from infinite distance to a point at a distance r from the element. In the chapter on condensers, the application of abstract formulas or points of theory such as these to purposes of utility is made instructively manifest. In that on electro-motors, the most recent gains in the economy of telegraphs, light-mechanism, printing, and other machinery are summed up, the means of measuring electro-motive force being given by what is known as Ohm's law—that the current is equal to the electro-motive force divided by the resistance, and the resistance determined by Wheatstone's "rheostat," or his "bridge," or the apparatus of M. Jules Regnault.

On the subjects of heat and sound, as well as upon the general principles of force, molecular physics, and the laws of motion in fluids, M. Deschanel leaves little to be desired. It is chiefly in the section of thermo-dynamics that the editor has felt himself called upon to modify or supplement his author. The chapters on conduction of heat and on terrestrial temperatures have been nearly re-written, and much new matter has been added in connexion with hygrometry and weather tests in general, the theory of exchanges originally known as Prevost's theory, or that of the "mobile equilibrium of temperature," and the specific heats of gases. In the concluding part on optics, the chapters on the wave theory and the polarization of light are new, and many modifications have been introduced to bring this important section up to the latest and most advanced standard of knowledge. What we look for in a work of this class is not so much new and profound additions to what is known as the clear and systematic exposition of well ascertained results. If not so full or so striking as the sections on magnetism and electricity, this portion of M. Deschanel's work forms a good introduction to one of the most attractive, as well as the most rapidly advancing, of physical studies. The subject of spectrum analysis, with the boundless vista of promise opened by this most beautiful of recent discoveries in optics, will be found briefly but clearly treated, illustrated as it is by a well drawn and coloured sheet, exhibiting the lines and hues of the spectra of various sources of light, contrasting those of the solar disk and edge with those of the principal gases and elementary solids. The effect of pressure in forming a continuous spectrum, as proved by the experiments of Frankland and Lockyer, may be seen by comparing the varying breadths of bands in different spectra of the same gas, more particularly in the case of hydrogen. A further displacement of lines, not less connected with the undulatory theory of light, is that first traced by Doppler as a consequence of the motion of celestial bodies in space. A certain change of refrangibility was to be expected from the mutual approach or recession of the observer and the source of light, grounded upon reasoning that had been shown to hold good in the parallel theory of acoustics. Although inadequate to explain in full the different colours of the fixed stars, with which object it was first applied, this principle has proved of very important service in connexion with spectroscopic research. Displacement of a line towards the more refrangible end of the spectrum is found to indicate approach; displacement in the opposite direction to indicate recession; the velocity of either movement being calculable from the observed ratio of displacement. The changes in the straightness of the dark lines of the solar spectrum as the slit of the spectroscope crosses a spot in the sun's disk are no less to be taken as evidence of an up rush or down rush of gases in the sun's atmosphere in the region of the spot. The displacement of the line towards the red end in the spectrum of Sirius, made clear by the fine observations of Dr. Huggins, had been calculated to show an apparent motion of recession at the rate of 41·4 miles per second, reduced by consideration of the motion of the earth in its orbit to a real recession of 29·4 miles per second of Sirius from the sun. In a foot-note Professor Everett refers to a more recent paper, read while this volume was passing through the press, in which Dr. Huggins, as the result of observation with more powerful appliances, reduces the recession of Sirius to twenty miles per second. Arcturus is found to be nearing the sun at the rate of fifty miles in a second. Community of motion in certain sets of stars has been similarly established, and the general belief of astronomers confirmed as to the direction in which the solar system is moving with respect to the stars as a whole. Here, as throughout the book, we have evidence of the pains taken by the editor to give accuracy and finish to his work, as well as of the presence of those qualities which entitle it to confidence as a manual of elementary physics.

LABOULAYE'S POLITICAL LETTERS.*

WHEN the *Lettres politiques* of M. Laboulaye appeared in the *Journal des Débats* the first sentence of the Note to the Editor with which they were introduced seemed of itself to prove that they ought never to have been written. France, said M. Laboulaye, happy in being allowed to take breath, asks only silence and peace. The desire was so natural, the benefits to be derived from its gratification were so obvious, that any suggestion of a Constitution seemed out of place. If the truce of parties could be prolonged, there was at least a chance that they might come to understand one another better. M. Laboulaye's invitation to "examine the situation" with a view to the formation of a regular Government sounded like an announcement that the truce was at an end. By the time, however, that his letters had been collected into a pamphlet, this reason for finding fault with them had disappeared. With or without reason, M. Thiers has decreed that the Government cannot be maintained in the imperfectly organized state in which it exists at present. M. Laboulaye, therefore, may claim the credit of having foreseen the storm, and of having been the first to preach preparation for it. He does not include the issue between a Monarchy and a Republic among those which he describes as waiting for decision. In common with every reasonable French politician, he holds that events have virtually determined the choice of the country. The establishment of a Republic may be a *mariage de raison*, but the bride can bring as her portion union, peace, and liberty—a dowry three times richer than any that can be offered by her rivals. The most immediately important of the questions by him discussed are whether the Constitution, once made, shall be submitted to popular ratification, and whether, after it has been ratified, it shall be treated as open to amendment. The framers of the French Constitution of 1848 thought that they could lay down a fundamental law which the people should not be competent to alter. M. Laboulaye justly says that this is to rest the stability of institutions on the caprice of a particular legislator rather than on their intrinsic merits. The *Code civil* has lasted seventy years with no other protection than the wisdom of its provisions; of the Constitutions decreed to be eternal, not one has lasted five years. A Constitution is not a contract, it is a body of rules designed to promote the public welfare. If the nation is dissatisfied with it, it no longer answers its purpose. In what, then, does a Constitution differ from an ordinary law? In this, that the law is only intended to bind the citizens, while the Constitution is intended to bind the Legislature and the Executive. It follows from this that the Legislature, acting alone, neither ought to make the Constitution in the first instance, nor to alter it when it has been made. Otherwise the Constitution would be at the mercy of the very powers whose authority it is designed to limit.

Up to this point M. Laboulaye is altogether in the right. It is when he comes to the machinery by which the assent of the people is to be obtained, whether to the Constitution itself or to subsequent amendments in it, that we are forced to part company with him. In proposing to revive the *plébiscite*, he seems to forget that the objections to this mode of ratification do not rest only upon the evils which it is alleged to have brought upon France. It is probably true that the *plébiscite* is as innocent of the war of 1870 as of the re-

* *Lettres politiques; esquisse d'une constitution républicaine.* Par Edouard Laboulaye. Paris: Charpentier. 1872.

volution of the Fourth of September. It is certainly true that those who would organize democracy in France must frankly accept that popular sovereignty which is its essential condition. The vice of the *plébiscite* is not that it recognizes the sovereignty of the people, but that it provides the sovereign with the worst conceivable mode of giving expression to his will. To insist upon the submission of a Constitution to a popular vote is like forbidding a King to take the advice of his Ministers. In the ordinary business of life men are accustomed to refer all important inquiries to committees of some sort. They distrust their own judgment even in matters with which they are, in comparison with politics, familiar; and, left to themselves, they will distrust them at least as much in politics. M. Laboulaye is an ardent admirer of the Constitution of the United States; and he quotes the example of America as one of the arguments in favour of giving the people the right both of ratification and of amendment. It is to be wished that in this part of his scheme he had been content to copy his model more closely. The Fifth Article of the United States Constitution provides that amendments may be proposed either by Congress or by a special Convention called by Congress on the application of two-thirds of the Legislatures of the several States; and these amendments are to be valid when ratified either by the Legislatures or by Conventions in three-fourths of the several States, according as one or the other mode of ratification may be proposed by Congress. There is no approximation to a *plébiscite* here. There is great care to get at the real wishes of the people, and to guard against any approach to a catch vote; there is great consideration for the rights of minorities, for Congress is powerless if more than one-fourth of the local Legislatures, or Conventions specially substituted for them, object to a change; but there is no departure from the principle of representation. It would not be difficult to apply a modification of the same plan to France. If the preparation whether of the original Constitution or of changes in it were entrusted to the National Assembly, the ratification might in both cases be entrusted to the Councils-General, which are, in act, the local Legislatures of the departments. Or, if it were objected that the type of representative elected to look after local affairs might not be equally suited for voting on a project of a Constitution, the American plan of Conventions elected for this special purpose might be adopted. The main thing to be aimed at would be the certainty that the nation had not been taken unawares and committed by its representatives to a Constitution which in its heart it disliked. To secure this, it is essential that the popular consent shall be given to the Constitution, or to any alterations in it, after they have been reduced to shape as well as when they are only in the air. A people may elect a Constituent Assembly, and may even have some slight knowledge of the kind of Constitution which they wish the Assembly to frame. Yet when the result is actually published, it may be very different from the Constitution they expected, or they may have seen cause in the interval to change their minds on some of its essential features. If it has to be ratified by special Conventions elected for this sole purpose, the nation has an opportunity of giving effect to this change.

This, however, is only a reason for giving the preparation and the ratification of the Constitution to different bodies. A provision for a second Constituent Assembly to be elected the year after the draft Constitution had been published, and to have the right of accepting or rejecting it, would suffice to ensure the nation against being taken by surprise, or being made the victim of any interested coalitions among its representatives. But the American plan ensures even more than this. It breaks up the nation into its component fractions, and ascertains whether, when added together again, they really make up the apparent whole. It is true, no doubt, that the Federal character of the American Government supplies one main reason for requiring the consent of three-fourths of the State Legislatures. In this way the smaller States retain their equality with the larger, and the vote of Delaware neutralizes, as regards amendments of the Constitution, the vote of New York or Pennsylvania. But though this reason for submitting the Constitution to local Conventions does not apply to France, there is another advantage in the plan which makes it worth transplanting. It is important to make constitutional legislation visibly distinct from ordinary legislation, to make people understand that they are engaged in a more important business than that of an ordinary general election. The more conscious the ratification of the Constitution can be made, the less will be the probability of its being subjected to any hasty or capricious alterations. If the electors are simply summoned in two successive years to return two Assemblies, one to frame the Constitution and the other to ratify it, there is very little to bring home to them what it is that they are doing. The second election will usually be only a tamer reproduction of the first. But if the second election is invested with a distinctly local character; if, instead of eight or ten representatives returned by the department to a national Convention, every canton has to send its quota of members to a departmental Convention; if the vote to be taken in this departmental Convention is for the time conclusive, though liable to be nullified by the discovery that less than one-fourth of the other departments have voted in the same sense, the popular interest will necessarily be very much greater. The character of the deputies returned will often be different from that of the deputies returned to a National Convention. They will be men who have ordinarily but little time to give to public affairs, men who, though not in any sense professional politicians, are known and trusted by their neighbours. These would not be recommendations for membership of a Constituent Assembly. The framing of a Constitution requires a different class of powers. But they would be eminent recommendations for representatives charged with the duty of saying Aye or No to a Constitution already framed. A Constitution adopted by a large majority of local Assemblies composed of representatives of this type would have secured the best attainable evidence that it answered to the wishes of the French nation.

If a Convention for each department should be thought an over-large allowance, it would not be difficult to group several departments together. Almost all Frenchmen now admit that the abolition of the old provincial divisions has been only in part successful, and that, even where it has been successful, it is by no means an unmixed gain. For every one except the legislator Normandy and Brittany, Gascony and Limousin, have still a meaning. It is only in the administration of the country that the varieties of race, of history, of temperament, which these names represent, are ignored. The late Duke of Broglie has pointed out that, twelve years ago, the military divisions which France then contained reproduced with substantial accuracy the old provinces, and that by restoring to each division its old name and its old associations an effective local government might easily be created. This course might be taken for the purposes of the local Conventions which have been spoken of. The number of separate bodies whose business it would be to ratify or reject the Constitution would thus be reduced to nineteen, any five of which would be able to prevent ratification in the first instance and change afterwards.

ANOTHER WORLD.*

THIS is a very curious book, very clearly written, but the exact purport of which it is somewhat hard to understand. "Hermes," whose name appears on the title-page, is ostensibly the editor, not the author, of the fragments of which the work is composed, and which are all uttered by a sage who speaks in the first person, and who, we are to understand, was once, and perhaps is still, the ruler of a planet belonging to our solar system. How the editor received the communications of this mysterious person he does not profess to explain; but, either in solemn earnest or with grave sustained irony, he would urgently dissuade the reader from setting down any of the revelations to the account of a wandering imagination.

From what we have said, many readers in this table-rapping age will be inclined to think that we have here one of those spiritual manifestations which are fast taking a place among the bores of the period. But there is nothing in common between the random utterances of supposed spirits and the plain, matter of fact, and even minute descriptions given by the sage in his fragments. Though he himself, as it seems, organized the polity by which his planet is governed, and though his narrative consists in a great measure of a record of his own legislative labours, there is nothing rhapsodical or enthusiastic in his style; he talks about his kingdom of Montalluyah as a Japanese ambassador might talk about Japan. About a spiritual world he does not profess to discourse. The citizens of Montalluyah live longer than we do, but they are equally mortal—human beings to all intents and purposes, who, thanks to their legislator, have attained a degree of civilization superior in many respects to our own. In describing the manners and customs of this "other world," the narrator does not quit the topics to which earthly thinkers are accustomed. Health, education, marriage, the removal of disease, the prevention of crime, the employment of physical agencies, all come under consideration, and, however strange some of the "revelations" may be, they can seldom be called fantastic. "Hermes," indeed, far from wishing to be conspicuous as a dealer in the marvellous, seems to have published the words of his supposed instructor with a view of furnishing some useful hints to his less enlightened brethren, who, when they learn how things are managed in Montalluyah, may find reason for imitation:—

> Let all [he says in his preface] taste the fruit, though they do not behold the tree; profit by the diamonds, though they know not how they were extracted from the mine; accept what is found to be wholesome and fortifying in the waters, though the source of the river is unknown.

Montalluyah then, we may assume, is a Utopia, but the account of it differs herein from that of many other Utopias, that apparently it is almost entirely devoid of satire. Nor is it the sole, though it is the chief, object of "Hermes" to hold forth a model for imitation. He describes animals, plants, and minerals to which nothing corresponds among the objects to be found on earth, and the gravity with which the descriptions are given is most remarkable. If, while repeating the words of the narrator, the "editor" is laughing in his sleeve at the reader, it must be admitted that the use of the sleeve is most efficacious.

Let the book speak for itself. We set down what we gather here and there without the interruption of comment, accepting the narrator of the fragments for the nonce as a veritable and veracious historian. Montalluyah is not only the chief city in the world in question, but its name extends to the entire planet, in which there is but one kingdom governed by a Supreme Ruler, with the strange title "Tootmanyoso," and by twelve in-

* *Another World; or, Fragments from the Star City of Montalluyah.* By Hermes. London: Samuel Tinsley. 1873.

ferior kings.] In religion the people who inhabit it are rigidly monotheistic. In ancient times, it seems, the powers of nature were worshipped till a purer faith was introduced by a mythical sage named Elikoiah, who is only incidentally mentioned, but who was evidently the founder of such civilization as pertained to the inhabitants when the narrator of the fragments, raised to the rank of Tootmanyoso, began his work of reform.

According to mythological tradition the chief antagonist of the venerable Elikoiah was the hippopotamus, who in the early legends of Montalluyah plays a part not altogether dissimilar to that of the serpent in the Mosaic record. However, it was afterwards discovered that this original foe to the mankind of the planet was capable of being utilized to an indefinite degree, and during the reign of the reforming Tootmanyoso it became one of the most valuable animals in the kingdom. The method of training the hippopotamus is described with as much minuteness as if the planetary speaker had an eye to the manager of our Zoological Gardens. The reforms of the Tootmanyoso extended to every particular by which the moral or physical well-being of his people could be affected. Two principles mainly guided him. He settled within himself that in all cases of crime or disease prevention is better than cure, and also that for certain occupations certain persons were exclusively fitted. In these principles there is of course nothing novel; but the minuteness with which the account of their application is given is really surprising. Nothing is too great, nothing too small, for the solicitude of the Tootmanyoso. Now he constructs gigantic works compared with which the Egyptian pyramids are mole-hills; now he promotes the use of machines to prevent babies from hurting themselves by tumbling on their heads. No one can be more perfectly aware than the Tootmanyoso himself of the narrow frontier between the sublime and the ridiculous; but he answers scoffers by remarking that incalculable evil results from the neglect of "little things." Indeed the education of children on the principle that evil ought to be destroyed in the germ is with him an object of especial care; his whole proceeding being founded on the conviction that it is better to extirpate faults in the child than to punish crimes in the man. He founded a college of "character-divers," who by a natural gift, aided by a peculiar discipline, were able to penetrate into the dispositions of the young, and thus to eradicate faults, to develop good qualities, and to guide instructors as to the sort of training suitable to each individual case. He also established "amusement galleries," where in the intervals of study children were allowed to follow the bent of their own inclinations without restraint, thus facilitating the progress of the character-divers in their work of investigation.

The principle of putting the "right man" in the "right place" was pursued by the Tootmanyoso with a vigour which led to the minutest subdivision of labour. The profession of an oculist, for instance, extended, in his opinion, to far too large a subject for the exhaustive study of one man; and physicians were especially employed each in the care of some part of the eye, and so on in the various branches of medical science. One beneficial result of the minute subdivision of studies was an increased facility in the application of physical agencies, among which electricity holds a place so important that it is scarcely too much to say that an electric fluid circulates through all the institutions of Montalluyah. Men of science in that favoured land have discovered that every kind of body or substance, whether animate or inanimate, contains an electricity of its own, and that these different electricities stand in the most varied relations to each other:—

Some are diffused; some are concentrated; others are so tenacious of the body to which they belong that they are all but steadfast. Some are sympathetic; some antipathetic, attracting or repelling each other; some mingle gently; others, when brought into contact, cause violent explosions.

For what purposes these electricities—a large stock of which is preserved ready for use in a large "electric store-house"—may *not* be employed we cannot discover. By them bodies are lightened, the facilities of locomotion are increased, the germs of disease are eradicated, optical instruments are rendered more efficient, and musical instruments more delightful, flowers are made more beautiful, and photographic art is perfected. With such electricities as there are in Montalluyah, and with a Royal Society guided by such a Tootmanyoso, it is easy to believe that an antediluvian longevity is attained by nearly all the inhabitants, who at last die gently from old age. We can scarcely make out why they should die at all.

In illustration of one of the humblest uses to which electricity is applied we give the statement of a "fact" and its results:—

In my reign some interesting discoveries were made with regard to water. From a source situated in the midst of a lovely scene flowed a spring of remarkably pure quality, some drops of which, taken at a distance, presented, when viewed through a microscope, a true picture of the landscape close to the source from whence they came. Rocks, trees, shrubs, sky, were there faithfully delineated with their varied forms and colours, together with the resemblances of two persons, lovers, seated on the banks. As we afterwards learned, they had been attracted by the beauty of the scene, had sat for a long time in the same place, and their portrait was, as it were, fixed on the water. The electricity of the sun and light had thrown the shadow or picture of the scene on the fluid, whose electricity had been sufficiently strong to retain it, and bear it to the spot whence the drops of water had been taken. This circumstance, and our knowledge that the reflecting power of the water is the result in part of its peculiar electricity, led to a very interesting discovery. With the assistance of a powerful attracting electric machine we can produce, together with the surrounding landscape, the likeness of a person, or of a group, actually many miles from the machine, if near the water. The image is received on the reflecting mirror of the machine, and an artist immediately copies outlines and colours.

Even some of the spectacles presented in public for the amusement of the people are produced by electrical agency. The only art that does not greatly thrive is the dramatic. Innocent plays of a pastoral kind are indeed occasionally performed; but the tragic drama is extinct. Before the reign of the reformer there was probably a sort of Elizabethan era; and when he came to the throne plays based upon crime were commonly acted. But when, through the aid of character-divers, electricity, &c., crime had fairly been driven beyond the boundary, tragedy became nearly unintelligible, the new generation being scarcely able to understand a plot relating to passions almost foreign to their nature.

So curious and so unconnected are the subjects set before us, that any selection we make must be by a somewhat haphazard process. Perhaps, as being a narrative complete in itself, and not resembling anything we have met in works of Oriental fiction, we shall not do wrong in giving the history of the Allmanyuka. The people of Montalluyah, it seems, who are generally fond of good living, and have been encouraged even by the reformer in a taste for gorgeous costume, which is minutely described, were accustomed in the early part of the Tootmanyoso's reign to make liberal use of sauces seasoned with stimulating spice. An epidemic disease arose, and, by means of a microscope (which was of course electrical), was traced to the operation of unwholesome condiments. Not without misgivings, so generally was the taste for the spice diffused, did the Tootmanyoso forbid its use. The extreme heat of the climate rendered stimulants necessary, and there was no known fruit or vegetable that could be employed as a substitute for the prohibited kind. The injurious condiments were indeed secured in large warehouses, and placed under the charge of the inferior kings before mentioned; but the Tootmanyoso was aware that, unless some new stimulant were discovered, the serpent would have been scotched, not killed. He shut himself up in a little cabinet at the summit of his palace, and passed some hours in meditation and prayer. At last a light burst upon him, and, having provided his people with a temporary cordial, he gathered a vegetable which bears the name Japperhanka and has a rich creamy taste, and grafted it on a tree called the Klook, the fruit of which has a sour aromatic flavour. By this combination he succeeded in growing a small vegetable uniting the flavour of cream with the piquancy of lemon, but lacking the stimulating qualities of the prohibited article. Into the seed of this new vegetable, therefore, in which an incision had been made, were inserted particles extracted from the seed of every spice-plant, and the care of the preparation was entrusted to the principal gardener, who after a while came to his master with the intelligence that a little bud was bursting forth in the urn in which the seed had been sown. In about three years fruit made its appearance, and the first specimen was brought in by the gardener in a basket, beautiful even for Montalluyah, where basket-work is carried to extraordinary perfection. On perceiving the contents of the basket the Tootmanyoso uttered "such a cry of joy as might escape a parent on finding a long-lost child." The first cooking of this precious product was not to be entrusted to the care of an ordinary *chef*. The Tootmanyoso, having ordered a small bird to be got ready, made with his own hands the sauce on which so much depended. The success was beyond expectation. So exquisitely appetizing was the condiment, that an epicure (the word is known in Montalluyah) might easily be tempted to eat the vegetable without the addition of the meat. Afterwards the fruit was extensively cultivated, declared wholesome by the new infallible doctors, and relished by all the people, who were loud in their manifestations of gratitude. As for the great inventor, he betook himself to the harp and sang hymns of thanksgiving. The harp, it is to be observed, is in Montalluyah the chief of all instruments, and a very magnificent instrument it is:—

Around its framework most elegant and tasteful ornaments are executed with the minutest perfection—small birds of variegated plumage perched on graceful foliage of green enamel, with flowers in their natural colours, so executed as closely to resemble nature. The birds, flowers, and foliage are connected with the chords of the harp, and conceal from view small vases or reservoirs set in the framework of the instrument. From these with every touch of the chords a beautiful fragrance is exhaled, the force or delicacy of which depends on the more powerful or gentler strains produced from the instrument.

The instant the player strikes the chords, the little birds open their wings, the flowers quiver in gentle action, and then from the vases are thrown off jets of perfume. The more strongly the chords are touched, the more powerfully does the fragrance play around.

In tender passages the perfume gradually dies away, till it becomes so faint as to be appreciated only by the most delicate organizations. The result, however, is, that the sense is gratified, the heart touched, and the whole soul is elevated.

As the Tootmanyoso generally speaks with an eye to our earth, shall we hazard a conjecture that in the description of the fruit vegetable "Allmanyuka" he intends a parable for the edification of teetotalers, hinting that before they attempt utterly to banish alcohol, they had better invent some wholesome stimulant with which even the most ardent advocate of permissive licences would not presume to interfere?

When we conclude with stating that the chapters, forty-seven in number, describe (*inter alia*) a suspended mountain which threatened to tumble down and crush all Montalluyah, till the Tootmanyoso propped it up with a colossal mountain-supporter,

the extensive use made of the microscope, the detection of incipient insanity, the rules observed in regulating the choice of a husband, the marriage ceremony, the language of flowers, elaborated to a high degree of perfection, the means employed for the cultivation of babyhood, ships of swan-like form that are incapable of sinking, and the hippopotamus, we have said enough to show that this odd book possesses at least the charm of variety, and is likely to contain hints on a vast number of subjects of interest to mankind.

MEMORIALS OF THE REIGN OF HENRY VI.*

THE general plan of these volumes leaves little to be desired in point of illustration. The first half of the first volume consists of an introduction, with an appendix to the introduction, and a copious chronological table of letters and documents, in which every paper printed in both volumes has been carefully epitomized and chronicled; after which follow notes to the chronological table, in which the editor has justified some of the tentative dates assigned to letters either wholly without date or without any other clue than the subscription of the day of the month. We have then a further supplement to the introduction, and a comparative table of documents according to their sequence in the volume. Again, more than half of the second volume is taken up with an "appendix of documents," a "glossary of rare words, and index of places less commonly known," a biographical index, and a general index. What more, we thought, could possibly be desired? Still we are bound to say that upon closer inspection we did not find that the execution of the work quite fulfilled the expectations we had formed. It is, however, we believe, Mr. George Williams's first venture in this series, and while several points strike us as open to criticism, we by no means wish to depreciate his editorial work, or to have it inferred that there is any probability that a subsequent publication from the same editor's hands will not be everything that could be desired. We have to object to details of arrangement, and we must note various marks of haste in the getting up of these volumes. In the first place, the appendix to the introduction consists of documents which ought to have found their way into the body of the work, whereas the supplement to the introduction should have been incorporated with it, and the chronological table of letters and documents is considerably diminished in value by the fact that it is not chronological except as regards letters and documents which are dated and give evidence of their own. In the first fifty pages the papers are in their proper order; in the last twenty they are arranged in the table in the order in which they appear in the volume. The plea for this is that these letters are undated, or that their dates can only be doubtfully or approximately fixed; and yet the dates of the greater part of them are perfectly ascertainable as far as the year is concerned. Some even may be tied down to a particular month and day, and some have the date and address on them in full, whilst again several of those which appear in the chronological series have been placed there from conjecture. Again, we think it a mistake to class together a glossary of rare words and an index of places less commonly known; neither do we understand the editor's idea of "places less commonly known," if Agen, capital of the department Lot-et-Garonne, is to be ranked among them. Moreover the explanations given of some of the really rare words hardly satisfy us. For instance, the first word in the index—*Accaeteria*—is explained as meaning the exchequer. Now this is identical with the English word *accatry*, which is not the same with exchequer, but has usually a special reference to provisions, such as come under the province of a house steward. We may, in passing, observe that we have come across many misprints which are not noticed amongst the *Corrigenda*; and Mr. Williams is sometimes even too laborious in explaining the methods by which he reaches his conclusions. It must often happen that an editor has great difficulty in fixing the dates of letters, but when he is satisfied that there remains no longer any room for doubt, it is often a work of supererogation to put before his readers the whole process of investigation which has resulted in his own satisfaction. An instance in point occurs as regards the letters which passed between Bekynton, in the second year of his consecration, and the Abbot of Glastonbury, the date of which is fixed beyond all reasonable doubt by that of two other letters which appear in the appendix, and which, if they had appeared in the body of the work, instead of in the appendix, would have carried their own evidence of date with them. As one of them happens to be dated Sunday, August 22, there is scarcely any appreciable difficulty in assigning it to the year 1445, and the editor need not have complicated the matter by informing us that August 22 fell on a Sunday in 1456, after the Abbot, to whom the letter was addressed, was dead and buried. As regards the style of printing adopted, we have the same fault to find which we have so often before noticed in the volumes of this series. Latin words should be presented in the style in which they were usually written, and as they appear in the MS. from which they are printed, and not be spelled so as to accommodate them to the Latin of the Augustan age. If there were no other objection to the correction of such words as *dampnum* into *damnum*, the difficulty of correctly carrying out the practice would, we think, be conclusive against it. Instances may be seen throughout both these volumes. We may instance one such in the variation of the word that was intended to be *antidata*, which occurs twice. In the one instance it is given as in the MS. *antidoda*, and no notice of the error is taken (for in this instance it is a mere error of the scribe). In the second occurrence of the same word it is by another error of the scribe spelled *antitoda*, but here Mr. Williams has corrected the text, and added a note stating what the reading of the MS. is. When we have added that the introduction seems to us deficient in method, we have finished the series of complaints which we have to make with respect to these valuable volumes.

For, indeed, they are entitled to be called valuable, both for their contents and for the great pains bestowed upon them by one whose heart has evidently been in his work. Probably no one unconnected with Eton and with King's would have taken so much interest and spent so much time and labour in editing Bekynton's official correspondence. The introduction contains a full account of the sources from which the volume is derived, a life of Bekynton, who was the writer of the greater part of the documents contained in it, and two other sections illustrative respectively of the domestic history and of the foreign relations of England during the fifteenth century. The greater part of these volumes has been edited from a MS., on vellum, in the Lambeth Library, of the fifteenth century, and therefore almost, or quite, contemporary with the events detailed in it. This the editor supposes to have been compiled under the direction of Bekynton himself, part of it belonging to the time when he was Archdeacon of Bucks, and part to the time when he held the bishopric of Bath and Wells. By far the most curious document in this volume is a copy of a draft of the compact between the Dukes of Bedford and Gloucester that they will bear true allegiance to the King, and assist each other with all brotherly affection, and will enter into no other compacts without the consent of both parties. Towards the end of the document, in that part of it which is intended for the attestation of the witnesses, it purports to be an agreement between the two Dukes on the one hand and Catherine, the Queen's mother, on the other. It is printed in the order in which it appears in the MS., on folio 50–52, between two documents which bear date respectively 1441 and 1442. It is unfortunately not dated, and probably never was really executed; at least no tidings of any such stipulation have reached us from any other quarter; and no argument as to its date can be derived from its position in the Lambeth volume, which, though frequently following the order of events, occasionally also deviates from it. It is of course of a date many years earlier than its position would indicate, for the Duke of Bedford died in 1435. The editor has placed it in his (so-called) chronological table without any suggestion as to its date. We can only conjecture that it is very early, possibly in the very first year of the reign. But the allusion which it contains to the seniority of the Duke of Bedford, and the reverence due to him on that score from the Duke of Gloucester, leads us to suppose that the document is of prior date to the enactments in Parliament of the year 1422 that the former should be Protector during his residence in England, and that during Bedford's absence as Regent of France the Duke of Gloucester should enjoy the prerogative of Protector in his own right. And we will observe that, in common with all the other documents in this index, it is very fully analysed and described; the only fault we have to find with this index being that it contains about seventy letters placed in the order in which they happen to occur in the text, instead of being inserted as nearly as possible in their proper order of time.

We proceed to notice a document of about twenty years later date, when the infant King was about attaining his majority. The journal of Thomas Bekynton on his third embassy to Gascony in 1442 is printed from a MS. belonging to the Ashmolean Collection at Oxford. Wharton refers to this diary as being at that time in the register of Charles Booth, Bishop of Hereford. The editor thinks that Wharton only knew of this volume by report, because he speaks of the journal as having been written by Bekynton, which it plainly is not, and also because he makes no allusion to the rest of the contents of the volume. This latter argument falls to the ground, unless the copy from which this transcript was made is identical with that which was once in Booth's register. On this point we can offer no opinion. The loss of that volume, which contained the registers of Booth, Fox, and Boner, who were successively Bishops of Hereford, is much to be regretted, as there is good reason to suppose that no bishops' registers of that time were kept so well as these. How a journal of 1422 ever found its way into a bishop's register of a century later, we must leave to others to determine. But there this document, or another copy of it, certainly was when Wharton wrote the dedication to his *Anglia Sacra* in 1689. The present is the first publication of the diary in the original Latin; but a translation of it made by Sir Nicholas Harris Nicolas was published in 1828, and a French translation made from the English version appeared in the *Indicateur*, a Bordeaux journal, in 1842. The contents of it relate to a subject of which history has taken little notice—namely, the embassy sent in June 1442 to the Count of Armagnac to contract a marriage between Henry VI. and one of the Count's unmarried daughters. It was evidently

* *Memorials of the Reign of King Henry VI.* Official Correspondence of Thomas Bekynton, Secretary to King Henry VI. and Bishop of Bath and Wells. Edited from a MS. in the Archiepiscopal Library at Lambeth, with an Appendix of Illustrative Documents, by George Williams, B.D., Vicar of Ringwood, late Fellow of King's College, Cambridge. Published by the authority of the Lords Commissioners of Her Majesty's Treasury, under the direction of the Master of the Rolls. 2 vols. London: Longmans & Co. 1872.

a piece of policy on the English side to cement an alliance with a native prince which might tend to render more secure the power of the King in the South of France, which was already tottering to its fall. But we learn from Bekynton's journal that the first motion came from the Count himself, and that the proposal was followed by the sending Sir Robert Roos, Sir Edward Hull, and Bekynton, recently appointed Secretary to the King, with a commission empowering them to contract the marriage with one of the three daughters of the Count, who, however, is not named. This commission is dated May 28, 1442, and Bekynton started from Windsor on his mission June 5, and after being joined by his colleagues, set sail from Plymouth on the 10th of July. The reason of the delay of the journey is sufficiently curious. The King, it appears, was afraid of being tied down to one particular lady whom upon seeing he might not fancy, and so issued fresh instructions to the envoys to the effect that they were to make their choice among the three young ladies. But whatever advantage was likely to accrue to the Count of Armagnac from the English alliance, the English soon began to cool in their project. Nothing was likely to be gained by a connexion with a family one part of which, including the Count's eldest son, the Viscount of Lomagne, was fighting with Charles VII. against England. Negotiations, however, proceeded for many months, and an artist was sent for from England to execute portraits of the three ladies from whom the King was to make his choice. Meanwhile the English were gradually losing ground in France, and it became plain that the alliance in a political point of view would be wholly unprofitable. So the ambassadors took their leave at the beginning of January 1443, and in the second week of February landed at Falmouth, and proceeded to inform the King of the entire failure of their negotiations.

The appendix of documents contains several contributions in illustration of the history of the period. But the account of the MSS. from which they are derived is sadly mixed up with the biography of Bekynton, and the discussion of the dates of certain letters. This is much to be regretted, for the introduction is full of instructive matter, which, owing to these constant dislocations, is propounded in a needlessly perplexing form. We cannot bestow too much praise on the unsparing trouble taken by the editor in getting up these volumes; and any one who will compare the document which we have been describing with the English version of the same, as published by Sir N. Harris Nicolas, will see some of the valuable results of the editor's diligence. Mr. Williams notices the mistakes in the proper names of places and persons which occur in this version, and modestly ascribes the superior accuracy of the present edition of the journal

to the happy accident which submitted the sheets when they were already prepared for publication to the revision of M. Francisque Michel, whose intimate acquaintance with the language and literature of France in the middle ages, joined to a minute knowledge of Bordeaux and its neighbourhood, acquired during a residence there of thirty years, enabled him to detect at a glance numerous inaccuracies, which had been too confidently copied from the pages of Sir H. Nicolas.

There is another document, in producing which Mr. Williams has done similar good service—namely, the extracts in No. CCLXXXV. from the *Dialogue in Praise of William of Wykeham*, from a MS. in the library of New College, Oxford. Several passages which are here reproduced had been previously printed by Henry Wharton in his *Anglia Sacra*, and, with an inaccuracy very uncommon in this accomplished and laborious scholar, had been mistaken by him as applying to Bekynton, whereas they really refer to Thomas Chaundler, Chancellor of Wells. Wharton printed from a copy in the Cotton Collection, and fell into several blunders from sheer inattention to the matter which he was copying; and many of these, we regret to say, because it detracts from Wharton's well-deserved fame, are scarcely excusable on the plea kindly set up for him by Mr. Williams —namely, "that the biographical notices of the Bishop and Chancellor are so mixed up with the philosophical disquisitions that it is not easy to disentangle them; and as he has brought together in a continuous narrative the passages relating to both, without any intimation of the *lacunæ*, the consequence of this omission of only a few words has been to fuse the two biographies into one."

In conclusion, notwithstanding the criticism which we have not scrupled to pass on various details of his work, we may offer Mr. Williams our thanks and congratulations for the valuable addition which he has made to the series of historical works published under the superintendence of the Master of the Rolls.

FALSE CARDS.*

MR. HAWLEY SMART is a writer whose novels are always welcome to the reviewer. He is not ambitious. He makes no especial pretension to a moral or a purpose. He writes primarily to amuse; very often he succeeds, and he is seldom or never dull. His aim is lightness and brightness. His style is easy without being slipshod. His knowledge of life is comprehensive if not profound, though in places it does remind us a little too much of Ouida and the author of *Guy Livingston*: and although he may be most at home among men and among the better classes of Bohemians, he can sketch attractive and womanly women. Yet we cannot say that as a writer he grows upon us; no one of his later books has equalled his earliest in freshness, and in our opinion *Breezie Langton* still remains by far his strongest title to reputation. There was much that was inartistic in it, as must always be the case when a clever man with a fertile fancy and without experience sets himself to tell his first story. Almost inevitably he dwells unduly on detail, or loses himself as he wanders into fascinating episode; he lets himself write much that is clever and misplaced, and then he has not the heart to retrench it on revision. But these sins against the stricter canons of the critics are very venial in the eyes of the reader, and, after all, it is his readers a writer writes for. If we are in really pleasant company we do not mind turning aside out of our way; we are supposed to be travelling through the book for pleasure, not hurrying along with an object. So, if *Breezie Langton* was somewhat discursive, we bore Mr. Smart no grudge on that account. He had kept us merrily on the move all along; we had had a good deal of "excellent fooling," and of pretty and rather touching love-making; and among the many distractions of some fictions that were better and very many that were worse, we retained pleasant memories of the author and his heroine.

We have met Mr. Smart more than once since then, and although he has always kept us in good humour, he has never quite fulfilled his first promise. Perhaps he raised our hopes unduly, but assuredly our prepossessions were all in his favour, and we took up his books prepared to laugh and to like. We cannot say that he has developed the originality of which we had suspected him; and if we are inclined to rank *False Cards* next to *Breezie Langton*, it is because the most telling points of this last novel seem to be borrowed from his first. The heroines, for instance, have a good deal in common in the circumstances of their lives as well as in their characters, and Lettice Cheslett reminds us agreeably of Breezie Langton. Lettice has her lot cast apart from her sex; she has learned nothing of the conventionalities of society, and in the frankest innocence compromises herself with its proprieties. She has enjoyed no more congenial companionship than that of an old and somewhat penurious grandfather. The instincts of her inborn delicacy are safe guides through many real dangers; yet they do not save her from becoming the victim of appearances, and her innocence and unprotected condition awaken our interest and appeal to our sympathies. It is the accident of a chance acquaintance she has formed that will decide her fate; and although we have a reasonable confidence that all will end happily, yet the subsidiary interest of the plot turns partly on her behaviour in trying circumstances, partly on that of the lover whom she has made the master of her destiny. Mr. Hawley Smart has evidently a strong artistic sympathy with the clever, good-hearted, somewhat reckless citizens of Bohemia. His writing plainly becomes a labour of love when he invites us to accompany Charlie Collingham to the office of the *Morning Misanthrope*, or takes us home to the room which that rising young journalist occupies in common with his friend the dramatic author. Perhaps even there Mr. Smart uses the privilege of the romancer and idealizes. At least we do not altogether believe in writers of real power turning out their daily tale of work with the phlegm and in the matter-of-fact manner in which a journeyman baker might draw his batch of hot bread from the oven. We suspect that few aspiring writers and dramatists are so happily thick-skinned as to be impervious to the most savage criticisms, and merely "take it out in tobacco smoke" when other men would be stung. Yet perhaps there is nothing intrinsically improbable in that fortunate blending of sensibility, stoicism, and epicurism; and Mr. Smart's literary gentlemen strike us as very real existences. We can scarcely say as much for Mr. Lightfoot, the professional scamp; yet although we believe Mr. Lightfoot to be purely fictitious, we must confess that the pains Mr. Smart has employed in his elaboration have created one of the most amusing characters in the volume. Mr. Lightfoot lives by his wits and the weaknesses of human nature. He systematically studies the advertisements in the daily journals in search of anything he may turn to his advantage. When in funds himself, he advertises under a variety of aliases, and figures in a Protean infinity of shapes, sowing broadcast that he may reap plentifully. His graceful and clever wife is a helpmate for him. For himself, he is a man of boundless resource and unfailing presence of mind. He has the tact of a man of the world, and bears the stamp of excellent society. He always says the right thing at the right moment, argues closely and logically, and is enough of a lawyer to give a shrewd guess at the lengths he may go without compromising himself with the authorities. Although playing a subordinate part, he figures perhaps more conspicuously than any one else. In the opening chapter we find him civilly baffling a bench of dignified magistrates who have him under examination, and who, after thinking they hold him fast, are disgusted to see him slip through their fingers. Mr. Lightfoot, indeed, is never so great as in moments of extremity, when he can display the fertility of resource and promptitude of resolution on which he prides himself. So when he turns amateur detective the shrewdest officer of the regular force is compelled to acknowledge him as his master. In short, Mr. Lightfoot is the Admirable Crichton of scamps and rogues; with his matchless gifts he might have shone in the Senate or led at the Bar; but if he is fantastically improbable, he is not the less amusing.

When he takes us out of Bohemia and Alsatia Mr. Smart leaves the ground on which he is strongest. In the world of respectability

* *False Cards.* By Hawley Smart, Author of "Breezie Langton," &c. London: Hurst & Blackett. 1872.

the story becomes comparatively commonplace and the characters tame, although there is a fairly solid plot, and a lady who makes all the mischief in her power. The scenes are laid between London and the small provincial town of Aldringham, chiefly in the latter. Two families figure prominently. One is that of Mr. Holbourne, the wealthy banker, who resides in an old-fashioned mansion in Aldringham. He has a son Reginald, a very handsome daughter Grace, and a niece Marion Langworthy, who, as we surmise at once, is to be the *deus ex machinâ* destined to work the mischief in the plot. The other family is that of the Collinghams of Churton Manor; and it likewise consists of four members. There are Sir John the father, a blind daughter Sylla, an elder son Robert, with whom we have little to do, and the younger one Charles, who figures with Reginald Holbourne as joint hero and leading lover. Charles is desperately in love with Grace Holbourne, and the young lady returns his passion. Reginald used to be in love with his cousin Marion Langworthy, and that designing and cold-blooded damsel still holds him to his engagement, although she is fully determined to throw him over should circumstances render it desirable. In the house where he lodges in London Reginald stumbles across Lettice Cheslett; he is taken first by her sweet face and girlish candour, and then drifts gradually into a warm attachment which is fanned by circumstances into a passion. The course of their true love could hardly have run very smooth in any case, for the old and pompous banker at Aldringham is not the man to welcome a daughter-in-law with neither money nor connexion. But the jealousy of Miss Langworthy, employing Lightfoot as her instrument, takes care to trouble it effectually, and condemns poor Lettice to very hard times and a long series of trials. Grace Holbourne and Charles Collingham have their anxieties too. There is a deadly breach between the young man and his proud old father, owing to an unfortunate misunderstanding which seems unlikely to be cleared up, and in the meantime Charlie has betaken himself to journalism for a livelihood. The couple of love stories are well told, and there is a good deal of incident to break the tender monotony of the billing and cooing. In either case Marion Langworthy figures as the evil genius, although her intrigues harry Grace Holbourne into an elopement and a happy marriage. Marion has approached her uncle by his weak side, until at last she has taught him to see with her eyes and hear with her ears. His daughter's position becomes so miserable that Collingham persuades her to trust herself to him while his prospects are still very precarious. Being moved by spite and jealousy, Marion's machinations against Lettice Cheslett and the faithless Reginald are even more audacious. It is jealousy, we may presume, that makes her forget her natural prudence, and be fool enough to trust herself and her reputation to the tender mercies of the unscrupulous Mr. Lightfoot. When she employs that intelligent gentleman as her agent, she at once makes him her master. So, again, there is an audacity foreign to her quiet scheming disposition when she presents herself to Lettice in Reginald's absence, and, by appealing adroitly to the girl's pride and to her fears for her lover, persuades her to take to flight, leaving no trace behind her. We are inclined to say that, had Miss Langworthy been reasonably consistent, she would have been guilty neither of the one imprudence nor the other. But the actions of a woman whose vanity is touched are even more unaccountable than those of a woman passionately in love. In any case we must admit that there is no violent improbability in the extravagance of behaviour which lends the story its excitement.

Having so much evil in her character, and more hardihood and decision than fortunately fall as a rule to the share of her sex, naturally Marion is the most sensational of the characters. She is far from being the most interesting, for she never engages our sympathies. She has no heart; we feel her to be cold and calculating. Not only has she no love for her cousin Reginald, to whom she is engaged, and towards whom she indulges in effusive outbreaks of sentiment when he appears to be likely to burst away from her fetters, but she cares nothing for the uncle who treats her as a daughter and loads her with kindness and gifts; nor for her cousin Grace, who has been used to regard her as a sister, until she finds her playing the cuckoo in the hedge-sparrow's nest and ousting her out of her father's affections. Lettice Cheslett, on the other hand, is in all respects the very reverse of Marion. Lettice knows little of the world even for her tender years; she has had no experience of what the world calls society; she is one of Byron's bread-and-butter misses. Yet we not only take a fancy to her from the first, as we might to a pretty, confiding child, but we learn to admire and respect her before we take leave of her. The nearest approach to genuine art in the story lies in the passages where Mr. Smart indicates the mutual influence for good of a man and a girl strongly attached to each other. Lettice is disturbed in the midst of the passionate pleasure she finds in the consciousness of being fondly loved by a man she has regarded as a demigod. While all the fibres of her heart are still thrilling to the shock, she sacrifices herself and her newborn passion to what she fancies to be his real interest. So sharp is the internal struggle that she nearly succumbs to it. Nor does her lover prove unworthy of her, for her devotion reacts upon him, and transforms and elevates him. Perhaps the transition is somewhat violent, which not only makes a selfish man unselfish of a sudden, but converts a light and irresolute character into one marked by unflinching determination of purpose. Yet we can conceive the thing possible, were the consciousness of the worth of a girl like Lettice to impress itself deeply on a susceptible nature terribly agitated by the dread of losing her. As for Grace Holbourne, she is a handsome, amiable, and very loving woman, and that is all. There is nothing marked in any of the other characters, although they are more than presentable as they flit about in the background. Perhaps the best is Mr. Holbourne the banker, with his pompous manners, his ostentatious deference to persons more highly placed than himself, and his rather vulgar consciousness of his own proud position as local magnate and millionaire. The one we like the least is Polly Meggott, a sprightly young female, who "does" for Charles Collingham and his friend in their rooms, relieving the monotony of their domestic retirement with "chaff" that must have jarred upon natures less irrepressibly cheerful. The plot, although slight, holds the story well together. The solution of the mystery that has weighed on the life of Charles Collingham is almost too simple, nor does retributive justice fall sufficiently heavily on Marion Langworthy, whose hatred and malice have caused so much unhappiness. But with its judicious mixture of the grave, the gay, and the tender, the book is to be recommended as one that may be run lightly through, with very little necessity for skipping.

AMERICAN LITERATURE.

THE peculiar economical and social position of the United States, and the minuteness with which the Census registers at the close of each decade every particular of their development, render its records among the most interesting of statistical works, though far too cumbrous for popular reading. If the results were summarized in a small volume, with a few pages of text pointing out the most striking and significant features of the national stock-taking, accompanied by about a score of tables giving the chief particulars for the several States and Territories, with the totals for the Union at large, and in certain cases for each of its great natural divisions, we can conceive few economic records more thoroughly acceptable, or more likely to attract universal attention. As the figures are presented in the official returns—by far the greater part of the tables being made out by counties, or even smaller subdivisions which are scarcely known or heeded beyond the immediate neighbourhood, with a deficiency of totals and of summarized tables enabling the reader to compare the larger masses at a single glance—the volumes are matter for painful search and study rather than for that easy mastery of facts which best conduces to their rapid acquisition and convenient digestion. Thus the first volume*, now before us, gives in eight hundred quarto pages of small print, spread over lengthy tables and "meandering through" wastes of blank columns, information the real substance of which, so far as it concerns or interests the general public, might be concentrated into some forty or fifty pages of a handy size and convenient type. This elaboration of detail is doubtless necessary and proper; but surely the digest we desire might be placed at the beginning or end of each volume, and spare the ordinary reader the trouble of looking further, except perhaps to search the detailed records of his own State or county. The "historical notes" and other explanatory portions of the volume, though important and useful, in nowise supply the lack of such a compact and instantly available summary. But the materials, though imperfectly digested, are ample beyond precedent, and, if not complete according to the ideal of the census-takers, seem marvellously abundant to those who find, after sufficient search, almost any statistical information they can desire for any purpose, practical or speculative. In this, as in all other cases where the collection and diffusion of knowledge respecting their country is in question, the democratic Government of America shows no sign of that tendency to parsimony which seems to be an ingrained characteristic of English Liberalism; nor do the people manifest any of that jealousy of official inquiries, that antipathy to Government "intrusion into their private business," which is so marked a feature of the stolid conservatism of English daily life and English habits of thought. The figures of this volume, though confined to "population and social statistics," contain matter that might well furnish the theme of half-a-dozen careful articles. The traces of the war still linger in its pages, though less perceptible here than in those which register the decline of Southern wealth. The white population of some of the Southern States, like Alabama and South Carolina, has actually declined since 1860, and that of others remains stationary. This is not due to exhaustion of the soil, or it would show itself rather in the older States, like Virginia; nor can it be ascribed to the ravages of war, for the Border States, which suffered most severely, do not show the same loss of population. We are inclined to believe that misgovernment and negro supremacy have much to do with it, as the States which remain stationary or fall back are those in which the ascendency of Northern adventurers and native freedmen is most marked. The negroes do not seem to be very great gainers. Their numbers have increased in ten years by about ten per cent.; the natural increase, according to the Census

* *Ninth Census.* Vol. I. The Statistics of the Population of the United States, embracing the Tables of Race, Nationality, Sex, Selected Ages, and Occupations. To which are added the Statistics of School Attendance and Illiteracy, of Schools, Libraries, Newspapers, and Periodicals, Churches, Pauperism and Crime, and of Areas, Families, and Dwellings. Compiled from the Original Returns of the Ninth Census (June 1, 1870), under the Direction of the Secretary of the Interior, by Francis A. Walker, Superintendent of Census. Washington: Government Printing Office. London: Trübner & Co. 1870.

authorities, should have been twenty-five. So far, then, as population is a test of the wholesomeness of institutions, the black race has not profited by emancipation. The process, or its consequences, may be regarded as answerable for a deficit of 600,000 lives in a population which should have reached five millions. In the North the foreign-born population is the element whose abnormal development influences the figures of the Census. We find the Irish-born, though far short of the monstrous estimates of some among themselves, the most numerous, reaching to above 1,800,000; the Germans come next with 1,600,000; then some 550,000 English. The Chinese, mostly confined to the Pacific Coast, and to particular districts there, only number some 62,000. It is worth notice that the excess of men over women is infinitely less than in even our older colonies, and less than might have been expected in a country where so large a fraction of the population are immigrants. Above ten years of age there are fourteen millions and a quarter of males, and almost fourteen millions of females. Another table, not without its interest, gives the churches, sittings, and property of each religious community. First come the Methodists, with six millions and a half of sittings and nearly seventy millions of dollars; next the Regular Baptists (largely negroes, we believe), with four millions of sittings and forty million dollars; Presbyterians, rather more than two million seats, and rather less than forty-eight million dollars; and the Roman Catholics, whose figures are about two and sixty respectively. The last, it will be seen, are thrice as rich in proportion to the number of sittings as most of the others; their churches will barely accommodate the Irish-born population. The Unitarians and Universalists, few in number, are also wealthy. The average, it will be observed, is about ten dollars per seat; but the Unitarians have forty, and the Universalists twenty-five. The Jewish ratio is one to seventy. The Episcopalians have less than one million seats, and more than thirty-six millions of endowments, being, as is well known, the richest of the sects whose numbers are at all considerable. The local distribution of sects, indicated in an earlier table, is a remarkable fact, and would afford scope for a good many historical and speculative inquiries. Altogether, there are few works more suggestive to the political student, as there are few more tedious to the careless reader, than the records of a Census, and, whether on account of the character of the facts, or of the fulness with which they are collected and set forth, no Census is equal in interest to that of the United States. The Census volume includes several useful maps, showing the density of population and the distribution of particular elements. We have also received in a separate form a complete series of the maps belonging to the Census; and they illustrate very clearly the distribution of races, of crops, of diseases, and of education. It is perhaps a defect that in showing the distribution of the different races—German, Irish, Black, &c.—they mark only the number on a square mile, and not the proportion to population generally, so that the parts most deeply tinted may be those where the proportion is smallest, and those most lightly coloured may mark a settlement almost exclusively German or Irish.

Next to this great volume in size and weight, and perhaps, of all the volumes on our list, furthest removed from it in character and value, is Dr. Dowling's History of Romanism * "from the earliest corruptions of Christianity" down to the proclamation of Papal Infallibility. The author has amassed a good many effective quotations from Roman Catholic and other authors, in proof either of charges of moral enormities which the accused, if they cannot deny, would be glad to palliate, or of doctrines which seem to him as bad or worse, but which Ultramontanists at least would accept and maintain as the boast rather than the reproach of their community. The way in which the two are classed together as of pretty equal atrocity, the bitter partisanship which manifests itself in every page, and assumes that the Church of Rome was from the first as useless and her influence as noxious as in ages when civilization had outgrown its leading-strings, the bias visible in each statement and each inference, and the manner in which such epithets as "anti-Christian" are scattered up and down through nine hundred pages, may gratify the author's theological hatred, and perhaps quicken the passions of those who feel as he does; but with those who have yet to acquire his prejudices, and especially with the young, the only effect of such a style must be to set them on their guard against the writer, and dispose them to a sort of antagonistic sympathy for the object of such wearisome and venomous attacks. The "Emblematic Title-page," and the preface which explains it, exhibit the temper of the author's school in no amiable light. The figures of two Reformers unveil a Papal cathedral menaced by celestial lightnings, while the Pope tramples on the Bible, encourages assassins, and sells absolution, and his mitred supporters hide their faces before the invectives of a black-robed Protestant preacher. This absurd frontispiece, which is evidently a subject of special pride to the author, reminds us of a picture of the Last Judgment, lately exposed in a London shop-window, in which a co-religionist of Dr. Dowling's had taken occasion to vent his own theological animosities in a similar manner, and to consign Popes and cardinals, monks and nuns, exclusively to the regions of despair on the left of the Throne.

Myths and Myth-Makers † is the title of a modest treatise of very unpretending dimensions, in which the "solar theory," as it is called, is explained in popular terms, and the alleged origin of the favourite legends of Aryan nations in celestial and meteorological phenomena set forth so simply that it can hardly fail to make an impression upon the minds of those who come fresh to the subject. The interpretation of some of the wildest and most weird traditions of German and Scandinavian folklore by reference to elemental phenomena, and to the phrases under which these have been personified, gives novelty and consistency to the solar explanation of classic mythology and mediæval legend. That the lightning is the mystic plant, rod, or serpent, which opens subterranean caves and admits the favourite hero to appropriate buried treasures—Ali Baba's *sesame*, and the original of the divining rod—is an ingenious and plausible offshoot of the general principle of elemental mythopoiesis; while in the case of the superstitions attaching to rats and mice, of which several are quoted, the author shows himself capable of seeking a sound interpretation outside the ordinary limits of his theory. Perhaps the weakest part of his book is that which relates to the wehrwolf superstition; for while he repeats the well-known explanation how the Greek "light-born" Apollo and his mythic relatives came, by a mere etymological blunder, to be figured as wolves, and the "bright" stars as "bears," he fails to find any relation between these and the parallel superstitions of Northern Europe, where no etymological confusion can explain the transformation of men and women into wild beasts, and especially into wolves. But altogether the book is a very readable popular treatise on an interesting subject, and the writer does not endanger his theory, so much as some of his predecessors have done, by forcing it into places which it cannot possibly fit, and using it to unlock mysteries of which it clearly does not supply the appropriate key.

The lady who recorded the experiences of an English Governess at the Siamese Court ‡ gives us in the "Romance of Harem Life" a series of stories of Siamese royalty and its *entourage*, the adventures of ladies attached to the royal harem, their errors and their punishment, which, whatever their other merits, are certainly as sensational as the most enthusiastic admirer of Miss Braddon could desire, and ugly and horrible enough to give the nightmare to those precocious *blasé* children of modern days on whom the simple horrors of the old ballads are powerless, and who can read the *Mysteries of Udolpho* or the *Castle of Otranto* without disturbing the rest of their nurses. False taste, false fine writing, false sentiment abound throughout. The stories themselves are professedly true in substance: and they may, for aught we can see, be a pretty fair reproduction of the tales that a foreigner, supposed by sex and by faith to sympathize with the fugitive slaves of the seraglio, might be likely to hear. Only when a Siamese lady enslaves herself and finally incurs a death of torture in order to procure for her husband the royal concubine on whom he had set his heart, we confess that our credulity is a little staggered. The book is not a pleasant one; but it contains some striking pictures of a life of which Englishmen know little or nothing, and of the condition of women under circumstances and laws among the most peculiar to be found even in the East.

Miss Edna Proctor's *Russian Journey* § is a series of sketches with pen and pencil—of which the latter are generally forcible, and sometimes decidedly good—of various scenes witnessed in the course of a somewhat hasty visit to Russia. The authoress shares that enthusiasm for Russian aggrandizement, Russian despotism, and the "manifest destiny" which ordains that the Romanoffs shall divide the world with the Yankees, which is so common among travelling Americans, and which makes their glorification of their own freedom and their contemptuous pity for the bondage of European nations so ludicrous in English eyes. When we came to find Alexander II. celebrated through several pages as "the Prince of the Free," we could not but look back to the beginning of the volume we had just laid down, where we read that the realms of the irresponsible despot of Siam rejoice in the title of the "Kingdom of the Free." It is true that Russians have a marvellous capacity for putting things in the best light before foreign visitors, and that American visitors have rarely the leisure or the opportunity to look below the decent surface which it suits their host to display. Yet we hardly expected to find a citizen of the Great Republic selecting as the especial theme of her admiration the freedom enjoyed by the subjects of the Czar.

We have to mention two books of very diverse appearance and pretensions on the same subject—the beauties of the famous Yosemite Valley of California ‖, with its mountain peaks, its lakes, its waterfalls, its rocks, and, above all, its "mammoth trees."

---

* *The History of Romanism, from the Earliest Corruptions of Christianity.* With Chronological Tables, Indexes, Glossary, and numerous illustrative Engravings. A New Edition, with Supplements containing the History from the Accession of Pope Pius IX. to his proclamation of Papal Infallibility, and his Deposition as a Temporal Sovereign, A.D. 1870. By John Dowling, D.D. New York: Edward Walker. London: Trübner & Co.

† *Myths and Myth-Makers: Old Tales and Superstitions interpreted by Comparative Mythology.* By John Fiske, M.A., LL.B., Assistant Librarian and late Lecturer of Philosophy at Harvard University. Boston: Osgood & Co. London: Trübner & Co. 1873.

‡ *The Romance of Siamese Harem Life.* By Mrs. Anna H. Leonowens, Author of the "English Governess at the Siamese Court." Illustrated. Boston: Osgood & Co. London: Trübner & Co. 1873.

§ *A Russian Journey.* By Edna Dean Proctor. With Illustrations. Boston: Osgood & Co. London: Trübner & Co. 1873.

‖ *Scenes of Wonder and Curiosity in California.* Illustrated with over One Hundred Engravings. By J. M. Hutchings (of Yo-Semite). New York and San Francisco: Roman & Co. London: Trübner & Co. 1873.

The one is little more than a guide-book of somewhat superior quality; the other * is a volume that might lie on any drawing-room table, containing a number of photographic views of the chief wonders of the Valley, splendidly got up, and accompanied by a letter-press of equally ambitious character. As books to be read, neither of the two has much to recommend it; but from either, by judicious skipping, the reader may gather some idea of the natural marvels of that beautiful scene—if by any chance, during the years through which they have been extolled with all the powers of American exaggeration, he has not happened to hear enough of them already.

We must not omit to notice another couple of volumes, each a curiosity in its way, on the favourite topic of American thought; elaborate rituals of the national dollar worship. *Money and How to Make It* † discusses at length the various occupations, agricultural, manufacturing, commercial, and professional, which are open to a youth wishing to attain that object of universal desire, and describes in detail the nature of each, the advantages and drawbacks it presents, and the conditions of success in it. It undertakes not only to assist his choice between different pursuits—on which the writer does not dwell very largely—but to instruct him in at least the elementary principles of each, and to furnish him with a variety of maxims, moral and practical, for his guidance therein; and, in short, is something between a Guide to Professions and an introductory encyclopædia of industry. *Getting On in the World* ‡ is a treatise of more moderate scope and more attainable purpose: its object being merely to indicate the general principles of practical prudence, the considerations that should govern a man's choice of a career, and the qualities and circumstances on which success in life generally depends. The author's mind is curiously divided between a desire to discourage belief in "luck" as a creed of mischievous moral tendency, and a firm faith in its reality which is proof even against algebraic demonstration and some acquaintance with the theory of probabilities.

Dr. Harman's *Journey to Egypt and the Holy Land* § is a work of the average quality of an American traveller's narrative, his own journal being the framework into which are inserted the quotations, reflections, and recollections, historical and other, that fill up the meagre skeleton to the dimensions of a moderate volume, and completely hide the dry bones of the ground-plan.

We do not often touch upon works purely theological, but we may just mention Mr. Collyer's volume of sermons, published under the title of *The Life that Now Is* ‖, as a very favourable specimen of that homely taste for practical illustration, that disposition to realize sacred principles by means of familiar images and ideas, which is characteristic of American, and especially of New England, preachers, and has led some of them very far astray. Mr. Collyer's homely simplicity is accompanied by true reverence and sound taste, and renders this volume as good a specimen of the practical type of American preaching as we have recently seen.

The works of fiction on our list are, as usual, more numerous than any other class of books. The author of *Camping Out* carries his boy-heroes through two more volumes ¶ of adventure, very readable, but hardly so lifelike or so real as the first series. *His Level Best* ** is the title of a short story which gives its name to a volume of wild, laughable, lively tales; and *A Comedy of Terrors* †† aspires to be at once sensational and comic, through about the usual length of a two-volume English novel.

---

* *The Wonders of the Yosemite Valley and of California.* By Samuel Kneeland, A.M., M.D., Professor of Zoology in the Massachusetts Institute of Technology. With Original Photographic Illustrations. By John P. Soule. Third Edition, revised and enlarged. Boston: Moore, Lee, & Shepard. New York: Lee, Shepard, & Dillingham. London: Trübner & Co. 1872.

† *A Book for the People: Money and How to Make It.* Comprising the History of Money, the general Principles of Money-making, with definite Directions for successfully conducting nearly all kinds of Business; to which are added Money in the Professions; how Working-men may make Money; Woman's Part in making Money; a Talk with Boys about Earning and Saving Money; how Parents should mould the Money-getting desire in their Children; with Suggestions as to Lending Money, and the Expenditure thereof to meet family needs, &c., &c., &c. By H. L. Reade. New York: John P. Jewett. London: Trübner & Co. 1872.

‡ *Getting On in the World; or, Hints on Success in Life.* By William Mathews, LL.D., Professor of Rhetoric and English Literature in the University of Chicago. Chicago: Griggs & Co. London: Trübner & Co. 1873.

§ *A Journey to Egypt and the Holy Land, in* 1869-1870. By Henry M. Harman, D.D., Professor of Ancient Languages and Literature in Dickinson College, Carlisle, Pa. Philadelphia: Lippincott & Co. London: Trübner & Co. 1873.

‖ *The Life that Now Is.* Sermons by Robert Collyer, Author of "Nature and Life." Boston: Lee & Shepard. New York: Lee, Shepard, & Dillingham. London: Trübner & Co. 1872.

¶ *Our Young Yachters' Series.* Vol. II. Left on Labrador; or, the Cruise of the Schooner Yacht "Curlew." As Recorded by "Wash." Edited by C. A. Stephens. Illustrated. Boston: Osgood & Co. London: Trübner & Co. 1872.

Our Young Yachters' Series. Vol. III. Off to the Geysers; or, the Young Yachters in Iceland. As Recorded by "Wade." Edited by C. A. Stephens. Illustrated. Boston: Osgood & Co. London: Trübner & Co. 1872.

** *His Level Best; and other Stories.* By Edward E. Hale. Boston: Osgood & Co. London: Trübner & Co. 1872.

†† *A Comedy of Terrors.* By James de Mille, Author of "The Dodge Club," &c. &c. Boston: Osgood & Co. London: Trübner & Co. 1872.

A new and neat "household edition" * of the poems of Whittier, the Quaker poet, politician, and philanthropist, does credit to the publishers, and can be recommended, as at once cheap and good, to the author's English admirers.

---

* *The Complete Poetical Works of John Greenleaf Whittier.* Household Edition, Boston: Osgood & Co. London: Trübner & Co. 1873.

NOTICE.

TRAINING COURSE of LECTURES and LESSONS for TEACHERS.—COLLEGE of PRECEPTORS (Incorporated by Royal Charter), 42 Queen Square, W.C.

The Council have appointed JOSEPH PAYNE, Esq., F.C.P., their first Professor of the Science and Art of Education.

Professor PAYNE will deliver Three connected COURSES of LECTURES in 1873, accompanied by Illustrative Lessons, Exercises, Expository Readings, Discussions, and Examinations, with the object of making Teachers familiar with the principles, practice, and history of Education.

Certificates will be granted by the College to those who, after attending all the Three Courses, pass a satisfactory final Examination.

For particulars apply at the College.

Fees, payable in advance—2½ Guineas for the Three Courses, or 1 Guinea for any Single Course.

Inaugural Lecture at 7·30 P.M. on Thursday, January 30, at the College. Admission free.

JOHN R. O'NEIL, *Secretary.*

CLIFTON COLLEGE.—SCHOLARSHIPS.—The following will be open for Competition at Midsummer next: 1. One or more Entrance Scholarships of the value of £90 a year during the holder's stay at the College. 2. The Guthrie Scholarship of £70 a year for Two Years, for Boys under seventeen. 3. One or more of £25 a year for Two Years, or till election to another Scholarship, for Boys under Sixteen. 4. One or more of £25 a year for Two Years, or till election to another Scholarship, for Boys under Fifteen. An allowance for age is made in favour of Young Boys for Nos. 1 and 4. Further information may be obtained of the HEAD-MASTER or SECRETARY, The College, Clifton, Bristol.

The College, Clifton January 16, 1873.

QUEENWOOD COLLEGE, near Stockbridge, Hants.—The FIRST TERM of 1873 commences January 15 and ends April 9. Preparation for the London Matriculation, and for the Royal College of Surgeons.—For Particulars, apply to

C. WILLMORE, *Principal.*

TRINITY COLLEGE, Glenalmond, Perth, N.B.

Warden—Rev. R. THORNTON, D.D. Oxon.

A School on the model of the greater Public Schools of England. Terms (including every necessary expense), 80 and 90 Guineas, according to age. There is also a Theological Department, for Candidates for Holy Orders. Particulars may be obtained from THE WARDEN.

RAMSGATE COLLEGE SCHOOL.—The next Term will commence on January 28, 1873.

Head-Master and Principal—Rev. THOMAS STANTIAL, D.C.L. Oxon.

Vice-Principal—F. G. BANKS, Esq., M.A., Worcester College, Oxford, Graduate in Classical Honours; assisted by Graduate Masters of experience.

Many Pupils of this School have recently taken high Honours at University and other Competitive Examinations, of whom a list will be furnished on application. For a prospectus of Terms, &c. apply to the Rev. Dr. STANTIAL, Chatham House, Ramsgate.

LADIES' SCHOOL, Mary Street House, TAUNTON, for the Daughters of Clergymen, Professional Men, and Gentlemen.—The Education given is a thoroughly sound one, and the assistance of experienced Masters is procured in the study of those branches of learning which are generally neglected in the education of Ladies. The real work done is tested by the College of Preceptors and the Oxford Local Examinations, and by examinations carefully conducted in the School itself. Four Pupils passed the Senior Oxford Local Examination and Two the Junior, in June last. And at the Christmas Examination of the College of Preceptors, Eight Third Class, Five Second Class, and Three First Class Certificates, including special and Honour Certificates, and the College First Prize for English subjects, were gained by the Pupils. Inclusive terms do not exceed 50 Guineas per annum. Full particulars will be forwarded on application to the LADY-PRINCIPAL. The highest references given.

FOLKESTONE.—The Rev. A. L. HUSSEY M.A., Ch.Ch., Oxford (late of Priorley House, Burks), PREPARES BOYS of Nine and upwards for Eton and other PUBLIC SCHOOLS, at Durham House.

FOLKESTONE.—Mr. W. J. JEAFFRESON, M.A. Oxon (formerly Principal of the Elphinstone High School, Bombay) will continue, with the Assistance of a Cambridge Honours-Man, to prepare PUPILS for the Universities, Indian Civil Service, Woolwich, and all Competitive Examinations.—Terms and References on application.

A GENTLEMAN (formerly in the Army), Married, living on his own Estate, in one of the best parts of Hants, assisted by a Militia Officer of great Experience in Tuition, wishes to receive SIX PUPILS to prepare them for the University, Civil Service, and Competitive Examinations. Both Gentlemen well versed in Modern Languages acquired Abroad. Church of England. The Advertiser, from his position, can offer gentlemanly Advantages. Highest references given and required.—Address, C. C., King's Library, Alton, Hants.

FRENCH FAMILY.—Mr. AUGUSTE BODART, who has had considerable experience in Tuition, continues to receive, on his own Estate, in one of the best parts of Boulogne, Two or Three PUPILS of good English Families, to whom he will devote his whole attention. One Vacancy.

The Pupils have peculiar Advantages, and there are great facilities for acquiring the French Language.

For further particulars, address to the Principal Notabilités of Boulogne, or to Mr. AUGUSTE BODART, 33 rue du Prince Albert, Boulogne-sur-mer, France.

AMALIENBERG CASTLE, Murgthal, G.-D. of Baden, and 24 rue de la Faisanderie, Passy, Paris.

Dr. HEDLER and BROTHER receive in their Establishments in Paris and Germany a Limited Number of ENGLISH PUPILS who wish to acquire a thorough knowledge of French and German. Both Establishments are beautifully situated, and offer in every respect all comforts of a private home. Highest References in England, France, and Germany. One of the Partners is now in London, and will be happy to see Parents or Guardians at 22 Hollies Street, Cavendish Square, any day from Eleven to Three, except on Saturdays. Letters can be directed to the above Address, for Inquiries, to Castle Amalienberg, or Paris.

PUPIL.—A GENTLEMAN, who has the Management of considerable Property in Kent, is prepared to receive into his Family a YOUNG GENTLEMAN wishing to be Instructed in the Duties of a LAND AGENT.—Address, X.Y.Z., Mr. Snelling's Library, Tonbridge.

ROMAN and INTERNATIONAL LAW.—Wanted, PRIVATE LESSONS in the above Subjects by a GENTLEMAN, who would be glad to meet with a Barrister able to give him an Hour in the Morning Three or Four Times a Week. A Critical Knowledge of the Text of certain Portions of the Digesta required.—Address, by letter, to R. T. L., 4 Arundel Club, Salisbury Street, Strand.

UNSALARIED GOVERNESS.—A LADY, well connected, an accomplished Linguist (having lived on the Continent for many years), a good Musician, experienced in and fond of Teaching, wishes to be received into a Gentleman's Family living in London, where she would give the Daughters Instruction, from Nine A.M. to One P.M., for her Board. Excellent references given and required, and a personal interview.—Address first, D., care of Miss Fitzer, High Street, Exeter.

A CLERGYMAN'S WIDOW wishes to meet with a LADY to LIVE with her; or she would take the entire Charge of a Young Lady requiring a Chaperone. The highest references given and required.—Letters to be addressed, L. H., 38 Southampton Street, Strand, W.C.

DAILY GOVERNESS.—A LADY is desirous of obtaining the Services of a DAILY GOVERNESS for the Instruction of her Two Daughters, of the respective ages of Sixteen and Ten, and of her Son, aged Six. She wishes to meet with a Lady who is thoroughly competent to give Instruction, without the aid of Masters, in English, French, German, Music, and Drawing, and who has had experience in Tuition; or a German Lady with a sufficient knowledge of the English Language would be acceptable for the Instruction of the Daughters of the Advertiser, who would make other arrangements respecting her Son's Education. The Advertiser is living at South Kensington, and would require the Daily Attendance of a Lady from Ten to Six o'clock, excepting on Saturday, when the Hours would be from Ten to Twelve o'clock.—Address (by letter), S. G., care of Messrs. Smith, Elder, & Co., 15 Waterloo Place, S.W.

A BACHELOR of ARTS of the University of Cambridge, who has had much Experience in preparing the Sons of Noblemen and Gentlemen for Eton, Harrow, the Universities, and Public Examinations, wishes to meet with an ENGAGEMENT.—Address, L. M. N. O., Post Office, Ebury Street, Pimlico, S.W.

HYDROPATHY.—SUDBROOK PARK, Richmond Hill. *Physician*—Dr. EDWARD LANE, M.A., M.D. Edin. Turkish Baths. Consultations daily (Saturday excepted) at 7 Princes Street, Hanover Square, from Ten till Twelve.

WINTER SEASON.—GRANVILLE HOTEL, St. Lawrence-on-Sea, Thanet.—During the Winter Months a Reduction of 25 per cent. will be made upon Apartments taken by the Week. Board, £4 3s. per week; Apartments according to size and position; Attendance, 1s. a day. Hydropathic, Turkish, or one and every description of Baths in the Hotel. Table-d'hôte at 6 30 P.M.

BRIGHTON.—BEDFORD HOTEL.—Every endeavour is made to render this Hotel equal to its long-existing repute. Spacious Coffee Room for Ladies and Gentlemen. Sea-Water Service in the Hotel.—Communications to The MANAGER, Bedford Hotel Company, Limited.

CAUTION.—The "NEW CHARTA PERFECTA COURT NOTE PAPER," Registered.—The Public are respectfully cautioned that the "NEW COURT NOTE PAPER" (as used by the Royal Family) is to be had only of JENNER & KNEWSTUB, Heraldic Engravers, Stationers, &c., by Special Appointments to their Royal Highnesses the Prince and Princess of Wales, 33 St. James's Street, and 66 Jermyn Street, S.W.

OVERLAND ROUTE.—The PENINSULAR and ORIENTAL STEAM NAVIGATION COMPANY BOOK PASSENGERS and receive Cargo and Parcels by their Steamers for

	From Southampton.	From Venice (calling at Ancona).	From Brindisi.
GIBRALTAR ..... MALTA	Every Thursday, at 2 p.m.	—	—
ALEXANDRIA ..... ADEN ..... BOMBAY	Every Thursday, at 2 p.m.	Every Friday Morning.	Every Monday, at 5 a.m.
GALLE ..... MADRAS ..... CALCUTTA ..... PENANG ..... SINGAPORE ..... CHINA ..... JAPAN	Thursday, Jan. 2 and 16, at 2 p.m.	Friday Morning, Jan. 10 and 24.	Monday, Jan. 13 and 27, at 5 a.m.

WILLIAM S. BURTON, General Furnishing Ironmonger, by appointment, to H.R.H. the Prince of Wales, sends a CATALOGUE, containing upwards of 850 Illustrations of his unrivalled Stock, with List of Prices and Plans of the 30 large Show-rooms, post free.—39 Oxford Street, W.; 1, 1A, 2, 3 and 4 Newman Street; 4, 5 and 6 Perry's Place; and 1 Newman Yard, London, W. The Cost of delivering Goods to the most distant parts of the United Kingdom by Railway is trifling. WILLIAM S. BURTON will always undertake delivery at a small fixed rate.

WOOD TAPESTRY DECORATIONS.—HOWARD'S PATENT.—Wood Tapestry can be applied to all even surfaces, being an adaptation of real wood, in lieu of painting or paper hanging, being beautiful in effect and exceedingly durable.

HOWARD & SONS,

Decorators, 25, 26, & 27 Berners Street, London, W., and Midland Buildings, New Street, Birmingham.

LADIES' BOOTS for SKATING.—Satin Boots, 10s. 6d. Guinea Cork-soled Boots. Velvet Boots, 5s. 6d. Catalogues, post free.

THOMAS D. MARSHALL, 192 Oxford Street, W.

ESTABLISHED 1864.

TIMEWELL, SPECIAL TAILOR and MILITARY OUTFITTER to Gentlemen who require no Credit, 8 Sackville Street, Piccadilly, W. "A private trade of highest class and character, yielding to its patrons the full advantages of their position." Book of Prices post free.

CLARK'S PATENT STEEL NOISELESS SHUTTERS, Self-Coiling, Fire and Thief Proof, can be adapted to any Window or other Opening. Prospectuses free. CLARK & CO., Sole Patentees, Rathbone Place, W.; Paris, Manchester, Liverpool, and Dublin.

THE LITERARY MACHINE (Patented), under Royal patronage, for holding a Book, Writing-desk, Lamp, Meals, &c., in any position, over a Bed, Sofa, or Chair, and screening the Face from the Fire. Invaluable to Invalids. Admirably adapted for India. A most useful and elegant Gift. Prices from 30s. Drawings free.

J. CARTER, 6A New Cavendish Street, Great Portland Street, W.

COLD CREAM of ROSES. In Jars, 1s.

PIESSE & LUBIN prepare this exquisite Cosmetic with the greatest care, fresh daily. Cold Cream Soap, free from alkali, 2s. per lb. Sold by all fashionable Druggists and Perfumers. Ask for PIESSE & LUBIN'S manufactures to prevent disappointment.—Laboratory of Flowers, 2 New Bond Street, London.

IRON WINE BINS.—FARROW & JACKSON (Business established 1780). First Wrought-Iron Wine Bins, invented and made by the late Mr. Farrow in 1821. First Wine Bins, with separate rest for each bottle, registered by present firm March 1, 1861. The new Exhibit Bins, also with separate rest for each bottle (but so arranged that the necks of the bottles are outwards, an advantage peculiar to this form of Wine Bin), registered by them March 26, 1872.—18 Great Tower Street, 6 Haymarket, 91 Mansell Street, London; and 23 Rue du Pont Neuf, Paris.

COCOA FOR INVALIDS.

SAVORY & MOORE'S DIGESTIVE COCOA.

Specially prepared for Sufferers from Indigestion, Debility, and Pulmonary Complaints; is highly nutritious, easily digested and palatable, and adapted for the most Delicate Stomach.

Sold in Tins from 1s. 6d. by all Chemists and Italian Warehousemen, and by the Manufacturers,

SAVORY & MOORE, 143 New Bond Street, London, W.

WM. YOUNGER & CO.'S ALES.—As a tonic and for purity and quality nothing can exceed these Ales in value.

Sold by leading retailers. See Trade Marks. Breweries, Edinburgh. Established 1749.

London Stores, Belvedere Road, S.E.; Liverpool Office, 31 South John Street.

SALT & CO.'S EAST INDIA PALE and BURTON ALES, in Bottle, also in Cask, in the finest Condition. CHAMPAGNE—Rosny, 42s.; Carte Blanche, 34s.; Sillery, 24s. per dozen. PORT—Cockburn's Old Crusted, 42s., 36s., 30s.; Dressed, 24s. per dozen. SHERRY—S. Fino, 30s.; Fino, 24s.; Pale or Gold, 24s. per dozen. CLARET—Good, 12s.; Superior, 15s., 18s., 21s. per dozen.—MOODY & CO., 46 Lime Street, London, E.C.

KINAHAN'S LL WHISKY.

This celebrated and most delicious old mellow Spirit is the very CREAM of IRISH WHISKIES, is unrivalled, perfectly pure, and more wholesome than the finest Cognac Brandy. Note the Red Seal, Pink Label, and Cork branded "Kinahan's LL. Whisky."

Wholesale Depôt, 20 GREAT TITCHFIELD STREET, OXFORD STREET, W.

SATURDAY REVIEW

OF

POLITICS, LITERATURE, SCIENCE, AND ART.

No. 901, Vol. 35. February 1, 1873. [Registered for Transmission abroad.] Price 6d.

THE COMING SESSION.

THE Ministers have made no secret of their principal plans for the Session, although it is probable that they may bring forward some minor measures which have not been formally announced. The nature of the Local Taxation and Government Bill is sufficiently explained by the recent republication of Mr. GOSCHEN's speeches and statistics of 1870. No Minister would proclaim on the eve of a Session that his own opinions on an important matter were unchanged unless he knew that his colleagues were prepared to reproduce his project of legislation. It is greatly to be regretted that Mr. GLADSTONE, Mr. GOSCHEN, and Mr. STANSFELD should not have paid any attention to the arguments against the Bill of 1870, which have never been answered. A readjustment of taxation which has not been demanded by the class which it is apparently intended to benefit must in almost all cases involve a gratuitous disturbance of existing relations. The rates are, with one exception which is about to be removed, at present administered by the representatives of those from whom they are raised. If owners are directly taxed, they will have practically no share in the management of local finance; for Mr. GOSCHEN's well-meant offer of a few seats at a Board containing a majority of occupiers would be wholly nugatory. Large proprietors indeed will, unless more sweeping changes are made to their detriment, be able to protect themselves against pecuniary loss, though not against the annoyance of being compelled to make new arrangements. Some of them may find compensation in the opportunity of buying up the lands of neighbouring small proprietors, who will in many instances be embarrassed or ruined by a wanton addition to their burdens. The collateral object of the Bill may perhaps be attained in the creation of an unfriendly feeling between landlords and tenants; but only a short-sighted Minister would wish to get rid of the county members who at present form the most solid part of the Opposition. Mr. GLADSTONE is quite strong enough in numbers; and if he could drive the Conservatives in a body from the House, he would, to a far greater extent than at present, find himself at the mercy of mutinous sections of his own party. Repeated threats of the secession of Nonconformists or extreme Liberals have again and again proved innocuous, because professed malcontents were not really disposed to help the Opposition into office. The agitators and the fanatics would become far more troublesome if a compact body of Conservatives were not at all times ready to support the Government against subversive measures. It is incredible that Mr. LOWE, Mr. CARDWELL, Mr. FORSTER, or Mr. GOSCHEN himself should wish to give additional strength to revolutionary factions. The Ministers are by this time aware that their plan is in the highest degree distasteful to all persons, of whatever party, who possess property in land. Mr. GLADSTONE and Mr. GOSCHEN in two successive Sessions announced in ironical language their intention of gratifying the unwise demand for a readjustment of local taxation; nor were they careful to conceal their purpose of injuring a class which furnishes a large proportion of their political opponents. Perhaps they may derive some advantage in the course of the debates from the angry feeling which they have deliberately provoked. Country gentlemen with all their merits are not invariably distinguished by calmness of temper or by controversial tact. Those who guide their counsels ought to take care that resistance to a necessarily complicated measure should not be rashly indiscriminate. It is impossible to oppose with effect the establishment of County Financial Boards; and those who, not without reason, doubt whether the Boards will do any good, will act wisely in reserving their opposition for less plausible portions of the Ministerial proposals. It may be worth while to consider whether different rates could not be separately charged on owners and occupiers respectively, and be administered in either case by the contributors to the special rate. Opposition may perhaps be paralysed by the inability of county members to reject a boon offered to the majority of their constituents. Measures which are introduced in the fifth Session of a Parliament are unfortunately addressed to the prejudices of the electors as well as to the judgment of the House of Commons.

The question of Irish University Education will, irrespectively of the merits of any measure which may be proposed, present great, if not insuperable, difficulties. It is scarcely possible that any plan which can be devised should fail to cause a dislocation of party relations. It is easy to yield to sectarian clamour, and sometimes it is safe to defy it; but in this instance one of two intolerant sects must necessarily be disappointed. It is difficult to say whether the narrowness of English Nonconformists or the bigotry of Irish priests is the more respectable; but both are indispensable supporters of the Government, and the allegiance of one or both may be forfeited even by the most prudent and statesmanlike proposal. The Government will probably propose to create an Examining Board with the title of a University; nor is it easy to suggest a more plausible method of solving or evading the difficulty; but as soon as it becomes necessary to provide for the constitution of the governing body, or for the appropriation of endowments, the Roman Catholic hierarchy will prefer claims which will be regarded as inadmissible by English and Scotch Liberals, and probably by many members of the Conservative Opposition. On a question of this kind it is useless to appeal to the constituencies, because their various opinions will be faithfully represented by their present members. Although it is reported that Mr. DISRAELI intends to concentrate his efforts on the defeat of the Irish Education Bill, the leaders of the Opposition will commit a serious blunder if they take advantage of the inevitable complications which must arise to thwart any reasonable plan which the Government may propose. In this matter, if in no other, Mr. GLADSTONE and his colleagues can only be actuated by the desire of abating a practical grievance which affects some Irish Roman Catholics, and of settling an irritating controversy. If it were found possible to drive them from office by snapping a division, or by coalescing with any section of the majority, their successors would immediately find themselves in the presence of the same complications. As it is not unlikely that among the results of the struggle may be a more active agitation for Home Rule, it is especially desirable that the responsibility of maintaining the unity of the Empire should devolve on the party which throughout the vicissitudes of political fortune is intrinsically the strongest. In dealing with English elementary education the Government will occupy a strong position as long as it remains on the defensive. From this point of view it is unfortunate that Mr. FORSTER during the last Session intimated his intention of making the appointment of School Boards compulsory; and the Secularists and Dissenters will insist on the redemption of his pledge. Any Bill for the purpose will be rejected by the House of Lords, even if it passes the House of Commons. In rural districts, where education is supplied by voluntary schools, the ratepayers may now at their discretion elect School Boards; but they have the good sense to abstain in the majority of cases from establishing bodies which would have nothing to do except perhaps to send half a dozen idle children to school. Press of business or the necessity for further consideration may be conveniently alleged as an excuse for not meddling further in the coming Session with the legislation of two years ago.

Both Houses of Parliament will be required to devote a portion of their attention to measures for the improvement of the law. The ATTORNEY-GENERAL has promised to introduce a code

of evidence which may, if it is adopted, and if it is found advantageous, serve as an instalment of a code of the entire law. The Lord Chancellor, having long been assured of his eventual succession to the office which he has now attained, has enjoyed ample time for deliberating on the principles of the measures which he is expected to propose. There can be no doubt that any Bill which he may introduce will be submitted in the first instance to the House of Lords, where he can himself superintend its progress. In Lord Cairns and Lord Westbury he will have competent and perhaps not unfriendly critics, nor will the peers as a body be disinclined to promote any measure of reform which may bear an exclusively legal character. It will be less easy to secure their favour for essentially political schemes of alteration in the tenure of land. The Bill for the abolition of primogeniture in case of intestacy ought to be introduced in the House of Commons, where it will be accepted by the moderate members of the majority as innocuous and inoperative, and cordially supported by extreme Liberals as a step towards Mr. Cobden's scheme of compulsory subdivision. Any Bill for the simplification of titles to land will necessarily involve restrictions on the power of settlement and entail; and the landowners have not yet been convinced by the arguments which are adduced to prove that it is for their interest to facilitate the alienation of their estates. It may be confidently asserted that no comprehensive measure relating to land will be passed by the present Parliament.

There is no reason to anticipate any of the casual incidents which sometimes endanger Governments or precipitate dissolutions. No foreign complications are known to exist, nor is there any visible risk of grave administrative miscarriage. It is known from Mr. Lowe's recent statement that he has already annihilated, or appropriated to the payment of the *Alabama* damages, the surplus which might otherwise have required an embarrassing choice among various claimants for relief. To Income-tax repealers and to Malt-tax repealers he will return the cheerful answer of the proverbial traveller with empty pockets who sang in the presence of the highwayman. If the money which might have been applied to the satisfaction of the American claims has already been spent in reducing the funded debt, there is no more to be said. A respectable section of the House of Commons approves of efforts to reduce the debt, and the payment is effected in a more unobjectionable manner by direct appropriation of a casual surplus than by complicated conversions of Consols into Terminable Annuities. It is an unavoidable misfortune that the end of a Parliament should be foreseen. In the last Session of a Parliament or in the last but one, the most single-minded Ministers are exposed to a suspicion that the wares which they offer are only made to sell, or, in plainer language, to be exchanged for votes at the general election. There is much reason to fear that the measures of the present Government may be attributed by ungenerous adversaries to the corrupt motive of purchasing support, and of sowing dissension in the hostile ranks.

PRINCE BISMARCK.

PRINCE BISMARCK has taken an early opportunity of explaining to the Prussian Chamber the motives and the significance of his resignation of the post of Premier. The substance of his explanation is extremely simple. Rumours had been spread that he resigned because his policy had received a check, and the inference was drawn that a policy to which he was more or less opposed would be henceforth pursued by the Cabinet. His reply is, that he resigned, not because he had received any check, but because he was overworked, and he stated positively his belief that no change would be made in the policy of the Cabinet, and his resolution to resign office altogether if any important change were made. That a Prime Minister should cease to be Prime Minister, and content himself with the headship of a department, is undoubtedly to English notions a downfall. But Prince Bismarck pointed out that Germany was not like England, and that he had not descended in the scale of power. As Foreign Minister of Prussia, as the Chancellor of the Empire, and as supreme ruler, under the Emperor, of Alsace and German Lorraine, he still retains complete command over the conduct of affairs so far as they are common to Prussia and to Germany. As to Prussian affairs, he has succeeded in putting at the head of the Cabinet a man in whom he thoroughly confides, who will carry out his policy, and who would as instantly resign as he himself would resign if in any essential point his policy were contravened. What he has freed himself from is the onerous task, which he confesses he has found most trying to his nerves, of teaching his colleagues one by one what he wishes them to do. Each Prussian Minister is independent of his colleagues, and responsible only to the King. The Prime Minister has to educate his colleagues one by one when he wants them to get new ideas into their heads, for he cannot tell them that if they do not coincide with him they must go. Nor is there any pre-existing harmony of general opinions and principles on which he can rely. Men of different parties and divergent political traditions and opinions sit in the same Cabinet, and educating them is therefore a wearisome task for a man who has some novelty in his mind which he is bent on getting them to adopt. This task Prince Bismarck proposes henceforth to devolve on General von Roon, who, in his opinion, is quite capable of discharging it. If he could himself have gone on educating his colleagues by long and repeated and often daily discussions, Prince Bismarck would have been happy to do so. But health and strength are somewhat failing him, and when he considered what was the portion of his work which took most out of him with least advantage to the public, he decided that the function of lecturing and persuading his Prussian colleagues was the one which he had best abandon. No doubt he gives up something. General von Roon may be the other self of Prince Bismarck, may see through his eyes, and echo his opinions, but he cannot have the same influence; and it must be one thing to be lectured and persuaded by an honest old soldier, and another to have the process performed by one of the most eminent statesmen in Europe. The point for Prince Bismarck to decide, and on which he had to satisfy his hearers, was whether, in abandoning thus much of power, he retained enough to secure a position worthy of him and practically sufficient for the ends he has in view. He thought that he would retain all that was necessary, and the Chamber seems to have adopted the same conclusion.

The main test of his abiding influence in the Cabinet and of the continuity of Ministerial policy was the attitude assumed by General von Roon and his colleagues in the great ecclesiastical quarrel which has sprung up. Prince Bismarck, speaking to a Chamber aware of the intentions announced by the Government in this respect, might confidently appeal to his hearers to say whether they were not satisfied that his policy was the policy of the Cabinet, although he had ceased to be Premier. The Government measures are sweeping enough and strong enough to make it certain that the clerical party has gained nothing by the change of Premier. In the first place, the Constitution is to be changed in one or two points, so that the objection which is sure to be made to the proposed changes on the ground of their being unconstitutional may be first disposed of. Then it is proposed to enact, first, that any one may change his creed who pleases without trouble or hindrance; secondly, that all persons exercising a clerical function shall have received a lay and not especially ecclesiastical education; and thirdly, that the inferior clergy shall be legally protected against the caprices of their superiors. This is carrying matters with a very high hand, and an opposition will be offered to the proposals of the Government which will certainly be bitter and determined, and which possibly may be in the first instance successful. What Prince Bismarck asks is, whether, having secured so much of what he wants in the policy of the Government, he would have been wise in ruining his health by continuing to discharge the fatiguing duties of guiding and impelling each member of the Cabinet in his decisions on a score of questions of more or less importance. To this question there was an obvious reply; and this was, that, although the Prince might be taken to have shown that he could not have done better in the interests of the public than he has done if the existing constitution of the Prussian Ministry is to remain unaltered, he might have given a different character to the Ministry altogether, and at once saved his health and augmented his influence. While each member of the Cabinet is independent of the other, each has to be gained over in turn by an enterprising chief; but if a homogeneous Cabinet were appointed, if all who worked with him were his friends and supporters, this painful and laborious task of converting unsympathizing colleagues would have been spared him. According to the English system, the Premier chooses subordinates who will work with him, and if they at any time refuse to work with him, they must go out of office, and he can replace them as he thinks best. It was very natural that a critic in the Prussian Chamber should have objected, in answer to Prince Bismarck's

explanation, that the Prince had only to get a Cabinet of the English pattern appointed, and his whole difficulty would have been removed. To this the Prince made an elaborate reply, which deserved and commanded close attention, and which to foreigners is full of instruction as to the real political state of Prussia, and in a minor degree of Germany.

There are two reasons why the English Ministerial system cannot at present be introduced into Prussia. The first is, that the Crown is not ready for it; and the second is, that the people are not ready for it. The King in Prussia governs as well as reigns. The Ministers are really his Ministers. He sees that the work of each department is carried on to his satisfaction. This is not merely a theory; it is a fact. It was a theory, not a fact, that LOUIS XV. or LOUIS XVI. governed France; but it is a fact that the HOHENZOLLERNS since they had a kingdom to govern have governed it. Prussian society is based upon the expectation that they will govern. The notion that the King is the head of everything forms part of the thoughts of every ordinary Prussian. The aristocracy looks to the King as its head, the soldiery fight for and with the King. Of course a man of the KING'S age and habits cannot govern as much or perhaps as well as an experienced able sovereign in the prime of life could govern, but he holds his own, works very hard, and makes his weight felt and his views respected. For him to abandon the position he now holds, and to adopt the comparatively humble and unobtrusive position of a sovereign under the regular Parliamentary system, would be not only a great personal sacrifice, which he would scarcely make unless he were obliged, but it would also be a great political change. The nobility in Prussia are powerful, and it is the personal tie binding them to the Sovereign that keeps them in subjection of some kind to the Government. The army is accustomed to obey not a Minister, but the King, and the military position of Prussia forbids it to try sudden experiments on the temper of the army. Even in this ecclesiastical struggle it is the thought that the KING calls on his subjects to support him against a foreign Prince that contributes more than anything else to the firmness of the bulk of those who are ready to support Prince BISMARCK. Then, again, the Prussian people are not ready, in Prince BISMARCK'S opinion, for the change to pure Parliamentary government. The conditions under which this kind of government can be thoroughly successful are, he hinted, beginning to fail in England, and English Prime Ministers have begun to find that they cannot firmly adhere to any line of policy while in office. But at any rate there are two requisites of the success of Parliamentary government which are found in England and are not found in Germany, although Germany may be visibly getting nearer every year to having them. In the first place, there is not that amount of political education in Germany which makes Englishmen anxious and determined that the national interests shall be upheld and order and domestic peace preserved, although the conduct of affairs may be in the hands of those to whom they individually are opposed. That is to say, in England Liberals and Conservatives think more of the country than of party triumphs; and this may on the whole be said to be true, and it is no doubt one of the very best and latest fruits of a long political education. In the next place, England has a superiority which Prince BISMARCK puts in a very odd way. He says that in England, when revolutionary measures are to be carried, we are clever enough to put the Conservatives in office, because they may be trusted not to carry revolution too far; whereas, when repressive measures are to be carried, we put the Liberals in office, because they will not be too severe. This seems at first sight to be a somewhat hasty generalization from the history of the Reform Bill of 1867 and that of Mr. AYRTON'S recent Park Regulations. But it is quite true that each party is obliged to carry on the government, not only in accordance with party principles, but with the wants and opinions of the country. A Conservative Government is obliged to do more than it might wish, and a Liberal Government is obliged to do less; and this is mainly due to the spread of political education, not through the bulk of the English community, which has little education, political or other, but through an indefinite number of persons who have got too far on in political education to be the mere slaves of party. It is, amongst other reasons, because such a body of persons is only just coming into existence in Prussia, and cannot as yet be said to have numbers or weight to give it importance, that Prince BISMARCK thinks the introduction of the English system of Parliamentary government into Prussia would be at present premature.

THE NEGOTIATIONS WITH RUSSIA.

AMONG other secrets which must be wholly or partially revealed on the meeting of Parliament will be the nature and result of the recent negotiations with Russia. The satisfaction which has been expressed with the policy of the Government may perhaps be well founded; but it is difficult to appreciate facts which are at present unknown. Something has been said, and possibly something may have been done; and it is at least certain that the Russian Government attached great importance to the communications with England. The Governor-General of the Russian possessions in Central Asia delayed his departure for his province until the return of Count SCHOUVALOFF; but it is only known that the official journals have been instructed to announce that a friendly understanding prevails between the two Governments. It is added that the negotiations commenced three years ago, a statement which is probably intended to depreciate the importance of recent events. The assertion that a neutral zone has been established between the English and Russian territories is a mere conjecture; nor can greater weight be attached to the rumour that Afghanistan is to be permanently neutralized. The Persian Minister in London has formally contradicted the statement that a part of the national territory has been ceded by treaty to Russia. On the other hand, it is repeated that the SHAH made the cession by a simple decree, as if he had been a mulatto President of a Republic transacting business with American speculators. Mr. VAMBERY, whose authority on all questions relating to Central Asia is of the highest order, complicates, or perhaps solves, the controversy by the statement that the valley which the Russians seem to have occupied was at no time practically included in the Persian monarchy. Mr. LOWE not long since ironically defended the authenticity of a legendary grant of land at Oxford on the ground that, as the property had not belonged to the supposed donor, his liberality was not incredible. It is not improbable that the SHAH may have been more ready to part with the valley of the Attrek if it was inhabited, not by subjects of his own, but by independent Turcoman tribes. There may perhaps be other engagements between Russia and Persia, but it is impossible to penetrate the secrets of Oriental diplomacy. The publication of General DUHAMEL'S memoir proves that in 1854 competent judges thought that for a Russian army the best road to India lay through Persian territory. It is probable that the same opinion might prevail at the present day if an invasion were contemplated; but it would be the height of folly to go to war because hostilities at some future time are not impossible. General DUHAMEL'S plan involved a war between Russia and Turkey, which at that time was actually raging, as well as between Russia and England. It is not certain that in a future war Russia could reckon on a Persian alliance. The SHAH proposes shortly to visit Europe, for the purpose probably of forming a judgment of the comparative strength of rival Powers. If he shares the acuteness which is attributed to his countrymen, he will not undervalue the resources of England because he will see but a handful of soldiers in the capital.

Among other disquieting rumours are statements of movements among adventurers under Russian protection who bear Afghan names and titles. In two cases they are said to have given up their prisoners to the Russians, who have therefore probably instigated their incursions. It had been previously known that Afghan fugitives and malcontents, including some members of the reigning family, had entered the Russian service. The accounts of their proceedings are for the present so vague and uncertain that it is impossible to judge whether they possess political importance. It is highly improbable that the Russian Government should during the negotiations with England openly encourage or permit any attack upon Afghan territory. It is acknowledged on all hands that, either by treaty or by interference on the part of England, Afghanistan must be secured against Russian encroachment. If it had been known that Afghan exiles under Russian protection were promoting disturbances on the frontiers of their country, Count SCHOUVALOFF'S negotiation must have been hopeless. When it was thought worth while to object to the permanent conquest of Khiva, an attack on Afghanistan by dependents of Russia would have been regarded almost as a declaration of war against England. If Count SCHOUVALOFF has really undertaken that the expedition against Khiva shall be recalled when it has effected its ostensible purpose, it may be inferred that the Imperial Government had never intended to dethrone the present dynasty. A commercial treaty extorted by the menace of annexation will probably satisfy the wishes of the Russian Government, especially as means will be adopted for

enforcing the observance of its provisions. If the Oxus can be used for navigation from its mouth to the city of Khiva, the Russian flotilla on the Sea of Aral will almost alone secure the obedience of the KHAN. The various relations of the sovereign princes of India to the Supreme Government supply ample precedents for almost every form of protectorate and political superiority. In course of time the Russians may find it practicable to employ the turbulent warriors of Khiva as auxiliary troops who may be useful in making further acquisitions. It may be confidently asserted that no treaty which could have been devised by the joint ingenuity of Lord GRANVILLE and Count SCHOUVALOFF would have prevented the ultimate absorption of Khiva in the Russian Empire. It may nevertheless have been prudent to take precautions against dangers which are still at a distance.

The judgment of the English and Indian Governments will be subjected to a severe test by an application for a commercial treaty from the ATALIGH GHAZEE, or ruler of Eastern Turkestan. In no other quarter is there greater probability of an early collision with Russian interests and policy. The same potentate who is now anxious to form friendly relations with India was lately induced or compelled to enter into a commercial treaty with Russia. Among civilized States in Europe or America there would be no necessary inconsistency between two commercial treaties executed by the same Government; but it is scarcely possible that the engagements of an Asiatic ruler with Russia should leave him at liberty to enter into similar relations with England or with the Indian Government. An unfailing accompaniment and a chief object of Russian progress and aggression is the extension of the protective or prohibitive tariff of the Empire to new regions. Like the Americans, who will much sooner discover the error of their system, the Russians are bent on rendering themselves industrially independent of foreign countries; and they also resemble the Americans in their readiness to enlarge the limits within which they are to enforce prohibition. A strict and consistent Protectionist ought to recur to the ancient French system of Customs duties, impeding trade between neighbouring provinces. If the Russian Empire, like the Roman, included the whole of the known world, free trade would, in spite of inveterate prejudice, become at once universal. There is no reason why the same freedom of intercourse should not be equally advantageous while other States maintain their national independence; but it is impossible to convince Russian statesmen that markets are not necessarily connected with dominion. Russia is conquering Central Asia, partly in accordance with an ambitious instinct and tradition, and more immediately for the purpose of multiplying producers of raw material and consumers of manufactured goods. All the Asiatic territories and dependencies are condemned to deal exclusively with Russia, unless indeed Lord GRANVILLE has obtained a promise that Khiva or any other country in Central Asia shall retain its freedom of trade. A commercial treaty with the ATALIGH GHAZEE will necessarily involve the obligation of protecting him in his compliance with the terms of the bargain. A Russian invasion of Eastern Turkestan for the avowed purpose of excluding English goods from the market would almost amount to an act of direct hostility. Whether it is allowable to conclude a treaty with full notice that it will clash with previous engagements to another Power is a question that will require the gravest consideration. A war undertaken for the purpose of vindicating an exclusive treaty might be morally unjust; but it would be difficult to prove that it was not excused by a legal pretext.

One of the strongest reasons for a patient, and even a temporizing, policy is the certainty that sooner or later economic fallacies will be everywhere dissipated. Less than a century ago England was employed in conquering tropical islands, as Russia is now annexing Asiatic provinces, for the purpose of securing exclusive markets. It is now understood in England that it may be convenient to deal with a shop even though the customer may not own the ground on which it stands. Within thirteen years a large part, and perhaps a majority, of the French nation has made the same discovery; and the present generation will almost certainly witness the abolition by general consent of the preposterous American tariff. Truth, when it is of the theoretical, and more especially of the profitable kind, will inevitably prevail in the end, though the conversion of Russia may probably be remote. As soon as Russia attains the intellectual condition of England, or borrows the results of English experience, the barriers which are laboriously raised between producers in England and consumers in Central Asia will crumble down without the necessity of war. The political ascendency of a civilized Power in a barbarous region will probably be, on the whole, beneficial; but in the meantime barbarians have sounder notions of trade than half-taught societies governed by crude and erroneous theories. There is no reason to believe that even the universal establishment of Free-trade will put an end to war; but it will remove one of the chief motives and pretexts of aggression. The English, even if they should hereafter resume the warlike propensities of their ancestors, will never again go about the seas conquering sugar islands. Russia itself will hereafter buy English cotton goods if they retain their present quality and comparative cheapness.

THE LIVERPOOL ELECTION.

THE sudden death of Mr. GRAVES created a vacancy at Liverpool which was unwelcome to both the political parties there, not only because they alike regretted a member of more than usual fitness for his post, but also because they had no candidate ready, and saw before them the prospect of a contest at a very inconvenient time. No one much likes to come forward at the fag end of a Parliament to sit perhaps for a few months and then have to retire into obscurity. The result is that the two parties have been driven to fall back on candidates with little else to be said in their favour than that they live in Liverpool. The Liberal Committee did indeed aim at better things. After inviting in vain some Liberal merchants of local eminence, they thought that they would look out for a stranger to the town who would do them credit and justify their choice by having connected his name with some great work of public utility. Mr. FITZJAMES STEPHEN, who has shown practically in India that he knows what codification means, and who is now endeavouring to get something effective done in the way of codification in England, was the stranger to whom they addressed themselves; and the choice was equally creditable to them and to Mr. STEPHEN, who was selected, not because he was up in the usual Liberal phrases, but because he could do one thing well which Liverpool, as well as the rest of England, has a strong interest in seeing well done. It was not indeed much that they had to offer him. There was scarcely a hope that he would have been returned, for the Liberal party is in a minority, and the minor men of the party were apparently strongly averse to any but a local candidate. But they had something to offer, for they would have made the name of their defeated candidate widely known, and Mr. STEPHEN might thus have probably found a seat at the next general election, not perhaps at Liverpool, but for some humbler constituency. However, Mr. STEPHEN declined and the Liberal Committee were so much puzzled and disheartened, that they suddenly resolved to make Mr. CAINE, a highly respectable young ironmaster, their candidate. The minor Liberals immediately caught at the suggestion, for he was local enough to suit their warmest wishes, being, as they proudly declared, the son of a Liverpool merchant and the grandson of a Liverpool tailor. The Conservatives had pitched upon Mr. TORR, an elderly merchant who has been assiduous for many years in aiding churches, schools, and hospitals, who is a Protestant to the backbone, and has, as he informed his friends, six generations of ancestors lying in the same church —all of them Protestants to the backbone—who has long lived in a general belief that the Conservatives are the right party because they keep so firmly to their principles, and whose more definite political views appear to have leapt into existence towards the close of last week.

The candidates appear to be very well matched, and, except that one of them will vote as Mr. GLADSTONE bids him, and that the other will vote as Mr. DISRAELI bids him, there does not seem to be any tangible difference between them. They really think alike on almost every point. They both keep as clear of general politics as they can, for they know but little of them; and as to the local interests of the town, they both promise to protect them to the best of their ability. They both are very zealous friends of the labourer; Mr. CAINE thinking that the gas-stokers have been too severely punished, and that the legal relations of masters and servants should be changed; Mr. TORR vaguely offering as his view that Parliament should somehow set up a High Court of Arbitration between employers and employed. Neither of them has anything to say about Irish Education, or Local Taxation, or Law Reform, and Mr. TORR candidly confessed that he was not aware that there were any special subjects of importance with which the Government was going to deal this Session. He had, however, one definite suggestion to make, which shows how far respectable local merchants ordi-

narily trouble themselves with the financial problem of the nation; and this was, that without the public expenditure being increased, the English navy should be made equal to the navies of all other European Powers put together. But it is no use dwelling on what is said by local candidates selected simply because they are local, and because under peculiar circumstances better local candidates hold back. Their greatness has been thrust upon them, and they ought not to be judged as if they had claimed for themselves any special fitness to sit in Parliament for Liverpool. It is more interesting to see what, under such circumstances, are the points on which the election is likely to turn, and many members who now hold precarious seats will study attentively and with much personal interest the history of the Liverpool election. Since the present Parliament first met, it has created two points of difference which rend the hearts of constituencies, and as to which it is most doubtful what is the card which lovers of expediency ought to play. Beer and the Bible are now the causes of eternal discord. A candidate is either the friend or the enemy of the publicans. He is either a supporter or an adversary of the 25th clause of the Education Act. These are the questions for which those zealous people who control large masses of votes really care, and it is by judicious boldness, or adroit manœuvring, or impenetrable haziness on them, that candidates of the humbler type have to seek to win their elections.

Differences about beer do not seem to rage very fiercely in Liverpool at present. Mr. CAINE is a supporter of the Permissive Bill, and the Liberal publicans appear doubtful whether they can overlook so grave an offence; but the acrimony of the religious dispute is so strong that it absorbs to a great degree minor points of difference. It, if anything, will break up the Conservative majority, and the local Liberal papers have candidly owned that until its disruptive power was made manifest, their side had scarcely a ghost of a chance. At the last general election the contest turned on the disestablishment of the Irish Church, and then the vigorous Protestantism of the strong Orange party at Liverpool carried everything before it. But now things are different. The registered electors are said to number 53,000, of whom 13,000 are Catholics, mostly of course Irish immigrants. The Orangemen and the ordinary Conservatives would probably still beat the Catholics and the ordinary Liberals; but the Education Act has wrought a sudden dislocation of parties. The Catholics and the members of the Established Church are in favour of the existing system, which works to their advantage. The Orangemen, who are led by Presbyterians, are dead against it. The old allies of the Conservatives are, therefore, on the eve of quitting them, and their old enemies are on the eve of joining them. This makes the election very uncertain, for the Orangemen or the Catholics may go over to the other side, or may remain neutral and not vote, or may at the last moment sink their differences, and go with their old party rather than see the seat lost. At present the ultra-Orangemen are in great wrath. It was in vain that Mr. TORR avowed himself to be the strongest of Protestants, and evoked the shades of his Protestant ancestors. He seemed to have wavered at first, but ultimately he made up his mind that he would support the existing system, and then his Orange friends began to howl at him. Mr. CAINE is in an equal difficulty. He would naturally declare that the 25th Section should be altered so as to suit the views of the Protestant Dissenters, but then there are thirteen thousand Catholics, and it will not do to lose them. He has thus sought refuge in vagueness, and contents himself with hoping "to see some modification in the Education Act "which will remove all causes of strife from so sacred "an object as the education of our children in all that it "befits a Christian to learn." There is no harm in hoping, and Mr. CAINE is free to show himself the most sanguine of men. No one can say what he means, and it must be owned that he has managed to use words which commit him to nothing, and give persons of very different opinions an excuse for believing that he will be found to be of their way of thinking. All this is very poor work, and the result of the election cannot be more than a matter of the merest local interest. But it must be remembered that, although Liverpool may probably get a different type of representative at the next general election, many smaller boroughs will then be in very much the same position in which Liverpool is now, and there is a serious risk that the complexion of the next Parliament may be in a great degree determined by the issue of petty struggles on matters which, in comparison with the larger interests of the nation, are of a very trivial character

FRANCE AND THE RIGHT.

IT is difficult to follow the proceedings of the Committee of Thirty with that respectful interest which is undoubtedly due to a body so respectable in its composition and enjoying so largely the confidence of the National Assembly. In theory the Committee is charged with a most important duty; it has to sketch out the first draft of the next French Constitution. In fact, its work is to devise the best sort of knot by which to tie M. THIERS's hands. Even this limited commission is subjected to a further restriction. The knot must be one that is agreeable to M. THIERS, and by this time it is pretty well understood that the only knot which will answer this description is one that he can untie whenever he likes. Within the field thus marked out the Committee is free to consult its own pleasure. The result of its deliberations will have indeed to be confirmed by the Assembly; but M. THIERS has as good as promised that if its proposals do not fetter him, except in form, he will not oppose their adoption. The drawback to this modified liberty of action is the necessity of giving the recommendations an air of severity and decision. The Committee was appointed to harvest the fruits of a victory claimed by the Right, and before it can come back to the Assembly with any show of joy it must bring something like a sheaf with it. In these matters M. THIERS has an unpleasant way of carrying off the crop, and leaving his adversaries in possession of the field and of such gleanings as they can find on it. He has not altered his habits on this occasion. The Committee has come to be regarded by the public as a mere whetstone for M. THIERS's ingenuity. Whenever it has come to a resolution there is a momentary curiosity to know whether he thinks it worth resisting or evading. But, except on these occasions, the existence of the Committee seems to be forgotten. It is essential to its dignity, therefore, that its last act should be imposing in form, whatever it may be in reality. The knot must at all events have a good many twists in it. In the early part of the week M. BROËT's proposal seemed to combine all the necessary conditions. It provided an elaborate machinery for regulating the appearances of M. THIERS in the Assembly. A Minister had first to state his conviction that the occasion was one which demanded the intervention of the President in the debate. This conviction had then to be embodied in a formal motion, upon which the decision of the Assembly was to be taken. When the Assembly had voted, the result of the division would be communicated to M. THIERS, and if it was in favour of hearing him, M. THIERS would send a message to the Assembly announcing his intention to speak. Here were formalities enough to please the most exacting member of the Right. Yet inasmuch as in the last resort M. THIERS could always demand through his Ministers to be heard, and could threaten to resign if leave was refused, his position towards the Assembly did not seem to be radically changed. His sword was left in his hands, and a single application of it to the cords promised to leave his motions as free as ever.

It is now supposed that M. THIERS is not inclined to accept M. BROËT's proposal. It may be that it is too cumbersome, that it interposes too many delays in the way of his speaking when it may be essential that he should speak promptly. It may be that the appearance of restraint is too great, that he wishes not only to be able to throw off the cords, but that the country should see that he is able to throw them off. It may be that he thinks the Committee is growing presumptuous, and needs to be taught its proper place. At all events, he is said to have told M. DE LARCY that he should prefer a compromise founded on M. DELACOUR'S amendment to one founded on M. BROËT'S. M. DELACOUR'S proposal is that the President should have the right of speaking in debates on interpellations when the interpellations relate to measures which have been discussed in the Council of Ministers, and countersigned by the Vice-President of the Council. It is easy enough to divine why M. THIERS should prefer this way out of the difficulty. It virtually gives him the right of speaking on every interpellation which is important enough for him to care about. There is not a single Ministerial act which may not be made to conform to M. DELACOUR'S standard. Every step the Government takes may be made the subject of a formal Cabinet deliberation, and be recorded in a minute countersigned by the Vice President of the Council. It is a further advantage perhaps in M. THIERS'S eyes that the Committee has already refused by a majority to take this amendment into consideration, so that an implied slight is administered to it by selecting this particular amendment as the basis of the consultation to be held

next week. It is not quite so easy, however, to see how the majority of the Committee can make the adoption of this proposal consist with their dignity. If they succeed in the attempt, the defence set up will probably be that M. DELACOUR's suggestion is a direct recognition of Ministerial responsibility. The only measures of which it condescends to take notice are measures which have been discussed in Cabinet, and which have been countersigned by the Vice-President. There is something imposing about the very word "counter-"signed"; it seems to imply that M. THIERS's signature standing alone does not go for much. The Vice-President is thus raised to a rank approaching that of a Prime Minister, and made specially responsible for all the acts of the Government. On the other hand, the result of the proposal is more than ever to identify M. THIERS with his Ministers. If he is only allowed to speak in defence of measures which have been discussed and countersigned in this formal way, he may be trusted to take care that nothing shall be discussed or countersigned of which he does not fully approve. Considering that the one desire of the Right is to separate M. THIERS from his Cabinet, to make it possible to get rid of the one without getting rid of the other, this seems to be a strange mode of attaining their purpose. It is intelligible that they should wish to encumber M. THIERS with a Vice-President of the Council whose countersignature shall be necessary to the validity of any act of the Ministry. It is intelligible that they should hope to secure this end by shutting M. THIERS's mouth upon every act which is not so countersigned. What is puzzling is that they should not see how valueless this precaution is unless they also secure the right of appointing the Vice-President. With this loophole left unguarded M. THIERS will in reality be just as much his own master as before. He will continue to be his own Prime Minister, and he will take care that no one shall serve as his lieutenant who is not willing to back his chief's bills. Probably, if the Committee consents to M. DELACOUR's proposal, it will be attributable to the growing conviction of the members that their affairs cannot be wound up without loss of credit, and that the longer they wait the greater the loss is likely to be. The absurdity of trying to convert M. THIERS into a dummy, while proclaiming all the time that it is absolutely impossible to dispense with him, is becoming too patent to be endured much longer. According to one theory which has been suggested, M. THIERS is using the Committee as a barometer of public opinion. He is watching the opinion entertained of its deliberations in the provinces, and as soon as this becomes sufficiently hostile he will appeal to the Assembly to take the constitutional problem into its own hands. Whether this is true or not, the idea can hardly fail to have occurred to the members of the Committee. They have got hold of a burning question, and if they mean to drop it without apparent discomposure, they had better drop it before it gets too hot to hold.

The blindness of the Right has never been more conspicuous than in the line they are taking about the military contracts at Lyons. The raking up of these accusations against the Government of National Defence can but throw suspicion on the patriotism of those who bring them forward. The speech of M. LACOUR in Thursday's sitting was exceedingly damaging to the Right. This is true, quite independently of any charges which may be made out against the economy of the administration at Lyons. M. LACOUR may have made extremely bad contracts; he may have paid a great deal too much for what he got; but unless it can be shown that he was in league with the contractors, and that the proceeds of their frauds went into his own pocket, the charge is altogether worthless. It does not appear that the report of the Committee goes this length. It speaks of reckless and wasteful profusion, and of gross want of caution in the acceptance of tenders. M. LACOUR's answer in effect is, that in a war of resistance, suddenly improvised and carried on without the help of regular troops or of military stores, caution and economy were impossible virtues. The one thing to be done was to send as many men as possible into the field, and arms and clothing had to be found for them at any cost. The most extravagant contract may have to be accepted under these circumstances, because, unpromising as its terms may be, they supply a chance of getting what is wanted; and where so much is at stake even a chance ought not to be thrown away. Of course this reasoning is lost on the Right, who hate M. GAMBETTA more than they hate the Germans. But though they may deny the force of it in their own minds, it is exceedingly imprudent to lose sight of the force which it will have in the country. M. LACOUR's speech will be a storehouse of extracts for use in the next general election. Men who wish to be successful candidates should not give an ex-prefect the opportunity of complaining that two years after the fact he is accused of spending money too freely in equipping French troops to fight against invasion.

MR. LOWE AND THE DEPUTATIONS.

ALTHOUGH Mr. LOWE's readiness to receive deputations is the result of good nature, he probably derives a certain pleasure from the opportunity of confuting volunteer advisers. In one recent case he has been convinced by the arguments of the hotel and tavern keepers that they ought not to be subjected to a special tax on their assistants which is not imposed on any other class of tradesmen. To the shopkeepers who lately repeated their complaint against the co-operative Civil Servants Mr. LOWE had the satisfaction of pointing out the obvious truth that, while they disclaimed any objection to co-operation, they really objected to nothing else. Through so candid and intelligent a spokesman as Mr. W. H. SMITH the tradesmen could not complain that they were undersold by the Co-operative Stores which have no necessary connexion with the Civil Service; but, if all the clerks in the Government offices were prohibited from taking part in the management of the Stores, the grievance of the retailers would not be redressed. As Mr. LOWE aptly observed, it would be useless to stop up the little hole for the kitten while the large hole for the cat remained unavoidably open. If the agitation proceeds, it is possible that the Government may, for the purpose of abating a troublesome clamour, discountenance the employment of Civil Servants in the management of Co-operative Stores; but the shopkeepers must be well aware that they would gain nothing by the substitution of non-official managers. It is happily impossible, as well as unjust, that any Minister should interfere with the household arrangements of clerks in Government offices. In former times the farmer and the rural consumer were commonly bound to take their corn exclusively to the lord's mill; but no London householder can be compelled, even if he is a clerk in a public office, to buy his goods at the nearest shop, unless indeed he finds it necessary to avoid giving offence to a creditor. It was desirable that the question should be discussed between the CHANCELLOR of the EXCHEQUER and the representatives of the discontented tradesmen rather than in the House of Commons, because the strength of the agitation consists not in arguments, but in votes. Fortunately no political party is likely to pledge itself against the co-operation of the middle classes, especially as a suppression of the system would transcend the power of Parliament. Mr. LOWE's modified disapproval of the administration of stores by Civil Servants can only be justified on the assumption that they exhaust in their supplementary business a portion of the energy which ought to be devoted to the public service. It is possible that by working too hard out of office hours a clerk might be rendered less capable of discharging his official duties; but it seems impracticable to define by any peremptory rule the limits of voluntary exertion.

It was perhaps with a consciousness that he had used some questionable statements and arguments in the recent discussion on the Malt-tax that Mr. LOWE allowed a more anomalous deputation to reopen the dispute. The opponents of the tax were on this occasion almost exclusively represented by an oratorical farmer, who, after alleging that Mr. COBDEN and Mr. BRIGHT were great men, asserted that beer was food, and that taxes on food were forbidden by the law of GOD. Mr. LOWE probably appreciates the ability of Mr. COBDEN and Mr. BRIGHT, although both of them have attacked him with unscrupulous virulence when he has on various occasions ventured to dissent from their opinions. It is too much to expect that he should consider himself bound by the authority of his most bitter assailants on a question which he is quite as capable of understanding as either Mr. COBDEN or Mr. BRIGHT. On the introduction of his first Budget of 1870 Mr. LOWE strongly expressed his dissent from Mr. BRIGHT's project of relieving the poorer classes from nearly all contribution to the public revenue. Half a century ago COBBETT earnestly protested against the innovation of substituting tea for beer as the labourer's beverage; but when Mr. BRIGHT invented the phrase of a free breakfast-table he was probably not thinking of beer. In a certain sense beer may be called food, because it is undoubtedly nutritious; and it may be added that good beer taken in moderation is a wholesome as well as a palatable kind of food; but gin and brandy also possess nutritive properties; and yet it is not commonly thought that a tax on spirits is inconsistent with any divine law. A wrong-headed gentleman announced the other day that he would have disobeyed the law of GOD if he

had not committed a contempt of the Court of Queen's Bench. Experience shows that in popular rhetoric the law of GOD means neither more nor less than the favourite hobby of the speaker. It would be inconsistent rather with good taste than with accuracy to say that any mischievous arrangement is contrary to the law of GOD because it injuriously affects the welfare of men. The CHANCELLOR of the EXCHEQUER has never attempted to deny that the Malt-tax, like most other taxes, does harm, inasmuch as it makes beer dearer, and the cultivation of barley less profitable; but, as long as a national revenue is required, all questions of taxation involve a balance of evils. When seventy millions have to be raised, the law of GOD only declares that the money must be obtained with the smallest possible injury to the community.

The insincere agitation against the Income-tax has of late been actively prosecuted, although the promoters have not demanded another interview with the CHANCELLOR of the EXCHEQUER. It is evident that the repeal of the Income-tax would render impossible either the abolition or the diminution of the Malt duty; and consequently the Associations for the repeal of various taxes judiciously abstain from noticing each other's proceedings. If Mr. LOWE were inclined to the indulgence of sarcastic humour, he might advantageously admit deputations against the Malt-tax and the Income-tax to a common audience. Every argument which could be used in support of either contention would tell against the opposite party, and in many cases the same authorities could be quoted in support of two inconsistent conclusions. There is one difference between the rival Associations which tells in favour of the farmers and the beer drinkers who really wish to get rid of the Malt duty. The opponents of the Income-tax, while they professedly denounce the whole impost, are exclusively concerned with one of the Schedules. A pawnbroker who has taken an active part in the movement formed by an odd coincidence one of the deputation of tradesmen to complain of the Civil Service Co-operative Stores; yet this indefatigable advocate of the interests of retail tradesmen gravely complained at a meeting at Bath of the pressure of the Income-tax on widows, on clergymen, and generally on owners of small fixed incomes. The Association proposes to increase the burden on the possessors of a humble competence; and some of its members would simultaneously prohibit the petty annuitant and the clerk from providing himself with articles of consumption at ready-money prices. The agitators undoubtedly expect that the repeal of the Income-tax in its present form would be followed by the imposition of an increased tax on realized property; and it would be impossible to distinguish between larger and smaller shares of the same kind of property, although, as at present, an abatement might be allowed to the poorest class of taxpayers.

As long as the institution of property is maintained, it is not the business of the financier to remodel the proportions in which wealth may chance to be distributed. No strong effort of imagination is required to assume that the whole cost of government might be defrayed from the rent of public domains. Many of the small German States were in former times administered by the Governments from their own revenues without the necessity of taxation; and at present the Prussian monarchy is enabled in the same manner to dispense with a Civil List. When the land revenue of India covered the expenditure, the country was, in the opinion of many economists, exempt from taxation; and if the plans of modern revolutionists at any time succeed, there will be no need of taxes, as there will be no property on which they can be levied. If a community which had been previously untaxed required an additional revenue, it would be the duty of a sound and equitable financier to raise the amount with perfect equality from all taxpayers. Every person would become positively poorer, while none would be relatively poorer or richer. A well-contrived Income-tax would be the cheapest and justest mode of providing the requisite amount; but experience shows that in practice exemptions must be allowed to the poorest classes, and perhaps abatements to some who are immediately above them. From the whole income of trades and professions, which is not less permanent than the rent of land or the interest of money, exactly the same deduction ought to be made as from the income of realized property. Any deviation from the plain rule of equality and uniformity evidently increases the comparative wealth of one class at the expense of another. Notwithstanding the undeniably vexatious nature of the tax, no alternative mode of raising a revenue is either so fair or so inexpensive. Duties on commodities necessarily tend to check industry and commerce; while the mischief of a direct tax ends with the simple exaction of money. If the financial reformers who advocate an extension of direct taxation were not perversely opposed to equality of assessment, their case would be stronger; but it seems hopeless to secure dispassionate consideration for the most fundamental fiscal questions.

HARCOURT AND LIBERTY.

IT is obvious enough, as Mr. VERNON HARCOURT says, that the decision of the Court of Queen's Bench on the Rules of the Parks, so far from having settled the question, has only opened a new campaign. And what sort of a campaign Mr. HARCOURT would like to make it, if he could, is pretty clear from his letter to the *Times*. It is a very fine letter in its way; only it is rather a speech than a letter, and reads somewhat coldly in big type. It reminds one perhaps a little too much of a rehearsal by daylight. It wants the gas, and an audience, and after-dinner enthusiasm to make it go off briskly. We must try to fancy Mr. HARCOURT surrounded by gay and festive Druids, glasses jingling, long clay pipes quivering with sympathetic emotion, bursts of laughter and cheering coming in to give point and emphasis to the orator's flourishes. It is a pity Mr. HARCOURT or his friend the Editor could not have spiced the address with a judicious handful of "cheers" and "laughter"; there is no mistaking the places where the speaker would have paused for the company to do its part in the performance. There are some good bits about the necessity for a "diurnal digest of Liberal coercion" and handy-books of Mr. AYRTON's decrees—"Every man his own Ayrton," two editions a day—and about the people of London having to walk out two and two like boarding-school misses, with a policeman on one side and a Ministerial duenna on the other, which might be trusted to set the table in a roar. Then there are what the reporters have a way of calling an "eloquent "tribute" to Mr. BRIGHT, and some thrilling sentences about "the great Common Law of English liberty" and "safety-valves "of property," which certainly require a chorus of cheers to give them their right ring. When the speaker went on to quote GROTIUS, and to talk about *temperamenta juris* and *temperamenta belli*, and usages of disputishable enjoyment, the Druids would have puffed very hard in awe-struck admiration. All that Mr. HARCOURT has to say about the Parks Bill, when reduced to its narrow literal meaning, is no doubt reasonable enough. He points out that there are two questions at issue, and that the decision in the Queen's Bench settles only one of them. The Judges have given their interpretation of the statute; but it has yet to be ascertained whether the statute thus interpreted is in accordance with the intentions of Parliament. And this is a question which Parliament alone can decide. Mr. AYRTON was understood to say at the close of last Session that no new rules would be enforced until Parliament had had an opportunity of considering them, and immediately afterwards he issued new rules and directed the police to enforce them. We shall not have long to wait for Mr. AYRTON's explanations as to the apparent discrepancy between his promise and his acts. It will be perhaps more important to know how the Parks are in future to be regulated, or whether it will be thought worth while to make any attempt to regulate them at all. Mr. HARCOURT, as far as we can make out, is against all kinds of rules and regulations on principle, and of course he has a perfect right to try to persuade Parliament to carry out his views. Whether meetings should or should not be allowed in the Parks, or, if allowed, under what conditions, are questions which may very properly be discussed. There is, as Mr. HARCOURT observes, an effectual means in a free country of getting rid of foolish and unjust laws, and that is, not by breaking, but by repealing, them.

All this of course is perfectly fair and reasonable. We may have our own opinion as to whether, in the interest of the community at large, the best use that can be made of the Parks is to turn them into happy hunting-grounds for roughs and agitators. But of course Parliament has just as much right to settle what shall be done with Hyde Park as to settle what shall be done with Kew Gardens or the British Museum. As long as the question is to be left for Parliament to decide we are satisfied. All we ask, or have ever asked, is that the people who want to hold meetings in the Parks will be good enough to obey the law as it is until they can get it altered to suit their wishes. Mr. HARCOURT professes to hold the same view; but his language is strangely at variance with his professions. The mischievous part of his letter consists, not in what he says in so many words, plainly and openly, but in what he hints, insinuates, and sug-

gests. "Respect the law, my good friends," he says; "if you "ask me what you should do, I advise you strongly to respect "the law." And then, in the same breath, he goes on to show what a wretched, rubbishy old scarecrow the law is, and how unworthy of respect, and how much superior moral rights are to mere legal privileges. Mr. HARCOURT is of course too good a lawyer to venture to dispute the law of the Parks as laid down in the Queen's Bench—at least to dispute it directly. But he tries to attack it indirectly, and to argue that something which he calls "the great Common Law of "English liberty" is entitled to much greater respect than judicial decisions or "the coercive Statute law of Household "Suffrage Parliaments." Let us admit, he says, for the sake of argument, that there is no legal right of meeting in the Parks. But, after all, what are legal rights? "The greater part of the "people of this country have very few rights, properly so called, "except the right to labour"; and then he quotes with approval Mr. BRIGHT'S "true and striking remark"—which we should say was rather more striking than true—that "the only right "which thirty millions of people have in the country which "they call their own is the right to walk on a dusty high road." We may here quote Mr. BRIGHT against himself; for he once went so far as to admit among popular rights the right to be buried, and if for rhetorical purposes he shut out of view various other rights, such as that of being governed by Parliament and not by an autocrat, and being tried by independent judges and free juries, it does not follow that those rights do not exist. Mr. HARCOURT went on to add on his own account:—"The truth "is that in law, with the exception of a very limited number "of persons, the English people are trespassers in England "altogether, save so far as they have occasional rights of "way." If all proprietors enforced their rights, he asks, what would become of the English people? We have a notion that proprietors as a rule—and proprietors belong to all classes of the population—do already enforce their rights pretty closely, and we fancy the English nation would go on very much as it has done. We believe that, in London at any rate, the right of way through the streets does not include the privilege of holding a public meeting in the back garden, any more than in the front parlour, of any house Mr. HARCOURT or Mr. ODGER may take a fancy to. Most parts of the country belong to somebody or other, and the fact that a bit of land is public property has not yet been held to confer a universal right of squatting. We are speaking now, however, only of law in the sense in which we know it. We were not aware, until Mr. HARCOURT published this remarkable letter, that there were so many different kinds of law in this country. We were acquainted with only one kind of real practical law —that is, the law interpreted and enforced by the Courts. But Mr. HARCOURT deals in all sorts of law which have apparently no connexion with any known courts of justice. The old-fashioned law expounded by judges is out of date, and we need new oracles to proclaim the "fundamental "principles of liberty, of justice, of straightforwardness, "and of common sense." We are afraid that some of Mr. HARCOURT'S systems of fancy law are only the Mrs. HARRISES of jurisprudence.

Mr. HARCOURT'S recent speeches scarcely prepared us, we must confess, for this pitiful and pernicious claptrap. The use of the word "Crown" in connexion with the Parks has created a good deal of confusion and misapprehension among ignorant people as to the relations of the public to this kind of property which Mr. HARCOURT might have usefully assisted in dispelling. The Crown, of course, in this instance is only another name for Parliament. The property belongs to the public, but to the public collectively and not individually; and it is the collective public which, through Parliament, determines to what purposes the property shall be applied, and in what manner its use shall be regulated. It is begging the whole question to call Mr. ODGER and his friends the public. They are only a part of the public, and the property is the property of the whole public, and not of a part of it. Many reasons might possibly be suggested why public meetings should be held under cover in the National Gallery instead of in Hyde Park. But at present the National Gallery is used, by the authority of Parliament, for an exhibition of pictures, and not for holding meetings in. According to Mr. HARCOURT'S suggestion, however, if the mob were one afternoon to break open the doors and hold a meeting in the gallery, they would acquire a "constitutional right" to use the building for the same purpose for ever afterwards at any time they chose. The Crown, says Mr. HARCOURT, is an august euphemism for Mr. AYRTON. Nobody knows better than Mr. HARCOURT that it is a synonym for Parliament, and that practically Mr. AYRTON has no authority except what he derives from Parliament. Mr. HARCOURT also observes that there is no resemblance between the proprietary authority over Knole or Chatsworth and over the Parks; and it is of course true that no private owner exercises the summary authority conferred by the Parks Act. The public in relation to the Parks is in the position of a private owner whose common-law rights have been supplemented by a special Act of Parliament.

THE RIVAL LEAGUES.

NO real friend to elementary education can look with any satisfaction on such meetings as those which have been held last week and this week by the Education Union and the Education League. There is no cause to question the zeal or the good faith of those who take part in these gatherings. But unhappily the zeal is in both cases untempered by discretion, while the good faith is too narrow to take into account more than one aspect of the question. Both Societies carry the word Education on their banner, but neither give it more than a secondary place in their programme. The League would to all appearance prefer that children should not be taught anything rather than they should be taught religion within certain hours or by certain persons. The Union would to all appearance prefer that children should not be taught anything rather than they should be taught religion except within the precise hours or by the precise persons to which the League object. That the State can have any interest above and beyond this particular controversy in seeing that no child shall grow up ignorant of the rudiments of secular knowledge does not seem to occur to either one or the other. Those who try to disentangle this paramount consideration from its religious or anti-religious accompaniments, cannot fail to be unpopular with both sides. But the cause they advocate is the cause nevertheless of the whole community, the cause of every one who knows that, whatever else children may learn or leave unlearnt, there is a certain amount of elementary instruction without which they can learn nothing, the cause even of those who, knowing this, persist in acting as though they knew it not.

Let us try to fancy a stranger unacquainted with the recent history of elementary education endeavouring to appreciate the actual position of the controversy. He would see a great number of voluntary schools doing thoroughly useful work at a very small cost to the State. If it were not for these schools, he would be told, the cost of elementary education would fall upon the ratepayers, a class already very heavily burdened and not as a rule animated by any keen enthusiasm for knowledge. At this point he would probably jump to the conclusion that the main thing to be considered was how to induce these voluntary schools to go on with their work instead of handing it over to the ratepayers. He would soon find out, however, that their managers are perfectly willing to keep their schools going provided they are allowed to include religion among the subjects taught. He would now think that he had got to the bottom of the difficulty, and that the opposition to voluntary schools must be prompted by the determination of their managers not to separate religious from secular instruction, or to allow of one being had without the other. By-and-by he would learn that this separation is already enforced in voluntary schools, that no child is obliged to be present at any religious lesson to which his parents or guardians object, and that, to make it easier to offer this objection, the religious lesson can only be given before or after the other work of the day. When, after this, he heard that there was a considerable section of politicians who think that to shut up these voluntary schools and leave the ratepayers to build and maintain schools out of their own pockets would further the spread of education and make it more generally popular, he would probably make up his mind that the ideas of so irrational a party were not worth further study. Let us now suppose this same stranger beginning at the other end of the story, and discovering in the first instance that there are a large number of Englishmen honestly anxious that the children of the poor should be educated, and, above all, that they should receive a religious education. Probably his first thought would be to suggest that, inasmuch as all parties are agreed that children should learn certain secular rudiments, though they differ as to whether any, or, if any, what, religious rudiments should be added, the simplest plan would be to teach the former in common and the latter separately. He would find, however, that those who want to teach religion insist upon having separate schools of their own in which a great part of the expense of teaching even the secular rudiments will fall upon themselves. He would next inquire

what advantage from a religious point of view this system of separate schools involved; whether, for example, the managers are allowed to make converts of children belonging to other religions, or to interweave religious instruction with the secular lessons. He would find that in both these respects the condition of a school manager under the Denominational system and under the secular system is precisely the same. In neither case can he teach religion to children whose parents wish to withdraw them, or at any time except before or after the secular work of the day. In both cases he is free to teach religion to all the children whose parents are willing to send them, either before the secular work has begun or after it is over. The result of this imaginary investigation would probably be to leave the conductor of it divided between wonder at the folly of the Secularist party in wishing to transfer a large part of the burden of secular education from the shoulders of willing and therefore liberal givers to those of unwilling and therefore stingy ratepayers, and wonder at the Quixotic generosity of the Denominationalist party in paying a large part of the cost of secular education, when their opportunities of giving religious instruction to the children would be just as good if they left the ratepayers to find the secular instruction themselves.

Both the Union and the League, therefore, seem to us to be strangely short-sighted. The Union declares that if the work of teaching religion to children is given to the clergy, or to voluntary helpers appointed by the clergy, instead of being given to a schoolmaster who is paid to teach other things and knows that his success in life depends on his teaching other things well, the whole fabric of national religion will be undermined, and Englishmen will be on the high road to communism and anarchy. The League declares that if the work of teaching children to read and write is given to a schoolmaster, who at another time of the day is engaged in giving a religious lesson, the State must shake itself free from the whole concern. The most sacred and venerable principles are invoked on both sides. The claim of religion to be an integral and essential part of a really sound education is set up by the Union, the inviolable sanctity of the individual conscience is set up by the League. Neither combatant is able to see that neither the one nor the other principle properly comes into the discussion; that, if the League had its way, religion might be taught to more children and with more effectual results than it is now; that, if the Union had its way, no ratepayer need pay a farthing towards the teaching of any religion in Denominational schools. This strange battle at cross purposes is perhaps best viewed in connexion with the Twenty-fifth Clause of the Education Act. The Union is shocked at the idea of a parent being obliged to send his child to a Board school, at which perhaps no religion is taught, or at most a religion which the parent thinks exceedingly imperfect, if not altogether mistaken. Its members forget that, under any circumstances, this very difficulty must eventually arise in a large number of parishes. If it is a hardship to make a Denominationalist parent send his child to a secular school, it must be equally a hardship to make a Secularist parent send his child to a Denominational school. Yet when compulsion becomes universal, as in one form or another it is sure to become before long, this latter hardship, if hardship it be, must be very generally inflicted if the Twenty-fifth Clause remains in force. Where there is only a single Denominational school forthcoming, then the parent belonging to another denomination, or to no denomination, will have no choice but to send his child to that school. If this would not be a violation of the parent's conscience—and under the protection of a conscience clause it certainly would not be—how can it be a violation of the parent's conscience to make him send his child to a School Board school under the same protection? The League, on the other hand, is willing that a parent who objects to secularism should, if necessary, be compelled to send his child to a secular school, even though he might send him to a school of which he approves at no greater cost to the School Board, because it is said the ratepayer's conscience, of the two, is more sacred than the parent's. Mr. DIXON tries to justify this by the plea that the conscience of the man who gives is more to be regarded than the conscience of the man who receives. But to this it may be answered that the conscience of the man who is dealing with his own flesh and blood is more sacred than the conscience of the man who is dealing only with money. We deny that either solution of the question involves any hardship; but any conscientious man must admit that, if there were any hardship in the matter, the position of the man who is obliged to send his child to a school which he thinks wicked is far worse than that of the ratepayer who is only obliged to pay for other people sending their children to schools which he thinks wicked. If resistance is noble in the latter case, how much more noble will it be in the former?

It is not, therefore, from either the Union or the League that any settlement of the educational controversy can be looked for. What hope there is must be placed on that great body of rational Englishmen who stand outside both. It is this body that we trust and believe Mr. FORSTER will have in view in any amendment he may propose in the Act of 1870.

CONTEMPT OF COURT.

AFTER the decision of the Court of Queen's Bench in regard to the TICHBORNE Claimant and Mr. SKIPWORTH, and Mr. Justice BLACKBURN'S very clear and positive declaration of the views of the Court as to the law of contempt, it may reasonably be assumed that there will now be absolute silence on all sides in regard to all matters connected with the approaching trial. Upon the very day that sentence was passed on Mr. ONSLOW and Mr. WHALLEY, Mr. SKIPWORTH at a meeting at Brighton attacked the Court, and especially the CHIEF JUSTICE, in most violent and unmeasured language. He asserted that the CHIEF JUSTICE was prejudiced, and unfit to try the case; he protested against the tyranny of the Court in attempting to suppress public meetings on behalf of the Claimant's defence, and he defied the Judges to do their worst with him. In Court Mr. SKIPWORTH admitted that an expression which he used at Brighton—"I hiss the CHIEF JUSTICE"—was not "happy," but he maintained his right to criticize and comment on the fitness of a judge for his public duties. Mr. SKIPWORTH, besides making speeches at various meetings, has written addresses to the QUEEN, the PRIME MINISTER, the Christian Knowledge Society, and the People of England. He represented to the Christian Knowledge Society that the present state of the TICHBORNE case was a greater proof of heathenism than anything that could be found at home or abroad; and he informed the People of England that Mr. GLADSTONE had been overheard saying to the ATTORNEY-GENERAL, "For GOD'S sake, do not deceive me with respect to "the TICHBORNE case," that the ATTORNEY-GENERAL had been seen with his arm round Serjeant BALLANTINE'S neck, and that editors of newspapers were bribed with cheques for 500*l*. The Claimant pleaded that he did not know he was committing any contempt of Court, and that he had no other way of defending himself against the attacks of the ATTORNEY-GENERAL and of the newspapers, who, with one exception, had all conspired against him, than by speaking at meetings. He urged that if the Court fined him they would be taking away the money for his defence, and that if he were to be imprisoned he would be unable to collect evidence and prepare his case. The Court, being willing to make some allowance for the peculiar position of the Claimant, bound him over for three months in recognizances, which were at once provided, not to repeat the offence. Mr. SKIPWORTH was fined 500*l*. and sentenced to three months' imprisonment. It was necessary that the Court should mark its sense of the gravity of the offence; but it is possible that even now, if Mr. SKIPWORTH were to apologize, and to retract his violent language, his punishment would be reduced.

Mr. Justice BLACKBURN was careful to explain that contempt of Court did not necessarily imply an attack on the personal dignity of the Bench, but that it consisted of anything which tended to prejudice the impartial trial in a suit. It might take the form of flattery, bribery, or intimidation, and might be directed against the judge, suitors, or witnesses. The Court was armed with summary powers for dealing with an offence of this kind, because it required to be promptly dealt with. In the present instance the Claimant and Mr. SKIPWORTH were guilty of contempt, inasmuch as they had endeavoured, not only to influence public opinion, but, by vituperative language, to prevent the CHIEF JUSTICE from taking part in the trial. Mr. Justice BLACKBURN observed that, though these efforts had proved ineffectual, it was necessary to vindicate the dignity of the law, and to put a stop to a public scandal. If such things were to be allowed, "a popular "person indicted for sedition or high treason might go about "the country addressing people, and in that case it might "require considerable nerve to resist the influence that might "be used." The CHIEF JUSTICE will preside at the trial at Bar, which the Judges are all agreed is the best way of trying the case, and there is no reason to fear that the Claimant will not have a fair and impartial trial. Till it is over we surely expect silence on all sides. It is, indeed, my

regretted that silence should ever have been broken. Justice is far more likely to be secured to all parties concerned by leaving the case to the Court of Queen's Bench than by any amount of discussion at meetings or in the newspapers. The Claimant is very angry with the press, which, he thinks, is leagued against him, and he seems to consider that the slightest reference to the former trial is an injustice to him. He complains that last week we treated him with "foul abuse." It is difficult to see how an article published on Saturday could furnish a justification for a speech delivered on the previous Monday; and it is scarcely necessary to say that our article contained no abuse of any kind. The reports in several of the morning papers attribute to us expressions which we never used. In incidentally referring to some of the issues raised at the former trial, we imagined that we were dealing with what might almost be regarded as history, and we had assuredly no intention of prejudicing the approaching trial. It appeared to us that we were saying nothing more than that the issue to be tried was in effect the resemblance of the Claimant to ROGER TICHBORNE. This seemed a very innocent and commonplace remark to make. The very name by which the "Claimant" is commonly known at once suggests the existence of the set of questions with which he is associated. And Mr. Justice BLACKBURN himself unavoidably directed attention to them in calling the Claimant "TICHBORNE, ORTON, CASTRO." During the whole time that the civil suit was in progress we never even alluded to it, and in commenting on its conclusion we were careful to guard ourselves against assuming anything as to the possible or probable result of the criminal trial that was to follow. We pointed out the inconvenience and impropriety of the Claimant's demonstrations when they first began, but we have not otherwise taken notice of him or them. The *Times* very justly observes that, while perfect impartiality may be demanded, it is hopeless to expect an impossible oblivion of all past evidence, and that no judge or juror can be found in the country who has literally no preconceived opinion as to the matter at issue. At the same time, there can be no question as to the supreme importance of keeping judicial questions out of the range of loose popular controversy; and for the sake of such a result journalists may reasonably submit to a little curtailment of their freedom.

PROFESSOR SEDGWICK.

ANOTHER veteran in science, with powers scarcely impaired to the last, has passed away from amongst us. Standing in the mathematical tripos at Cambridge in 1808 along with the names of Lord Langdale and Bishop Blomfield, the name of Adam Sedgwick has from that now patriarchal time held a prominent place not only in the comparatively domestic circle of college and University life, but in the annals of academical and scientific progress at large. In his own particular department of study his career serves as a span and measure of the very existence in this country of scientific geology—an existence due in no slight degree to his own labours. When in the year 1818 he succeeded Professor Hailstone in the Chair of Geology founded by Dr. John Woodward, what little was known or conjectured of the structure and history of the earth was divided in the main between the rival schools of Werner and Hutton. The primary outlines of the science as such had been laid down only about the beginning of the century—an achievement which won for William Smith the honours of the fatherhood of British geology. In the steps of this sound and practical observer Sedgwick from the first learnt to approach the secrets of nature. Patient accumulation of facts, and careful correlation of inferences, took the place of the more showy and ambitious methods which had rested upon *à priori* assumption. Personal intercourse and mutual confidence went far towards identifying the mental habits and the educational work of the elder and the younger student of nature. It was in the year 1821, in the course of his exploration of Westmoreland and Lancashire, that Father Smith had the happiness, as we have learnt from Professor Phillips he always deemed it, of meeting for the first time the enthusiastic young Cambridge Professor who had walked over the hills from Teesdale to Kirkby Lonsdale. In his speech on presenting the Wollaston gold medal, as President of the Geological Society, in January 1831, Sedgwick spoke in handsome and grateful terms of the practical lessons he had himself received from Mr. Smith. It was by tracking his footsteps, with his maps in hand, through Wiltshire and the neighbouring counties, where Smith had trodden nearly thirty years before, that Sedgwick owned himself to have traced out the bases of stratification, to have learned the subdivisions of the oolitic series, and to have apprehended the meaning of what had seemed to him at first but arbitrary and somewhat uncouth terms, but which had long since become engrafted into the language of English geologists, and through their influence had been in part also adopted by the naturalists of the Continent. Unobtrusive and singly bent, like his master, upon the cause of truth, Sedgwick was content to let many of his most fertile discoveries and original suggestions lie buried in "Transactions" and casual publications, nor did his name and his services to science ever command that publicity and prestige abroad which have been won by others, his coadjutors in the advance of British geology. But to every serious student of the science at home the consecutive series of his writings serves not only as so much gain to the store of geological facts, but as so many landmarks in the general progress of this branch of physics. It was at no time possible to say how much was due to him individually of the large works which were put forth under the joint names of Sedgwick and Murchison, though he never seems to have grudged the larger measure of honour which fell to the share of his more prominent colleague. His earliest acknowledged publication, a paper on the Geological Structure of the Devonian and Cornish Formations, read before the Cambridge Philosophical Society in 1820, embodied observations recorded and work done by him up to the year 1819. It was made clear that the fossil corals of the Plymouth beds were distinct from, and of older date than, those of the mountain limestone. To the stratification of Devonshire he is found returning fifteen years later in company with Murchison, jointly with whom he communicated a paper to the British Association, laying down the position and relations of the contorted and distorted deposits from Dartmoor to the North-Western coast of Devonshire, and proceeding in successive years to settle definitely the classification of all the older sedimentary formation of the South-West of England. Making his way for the most part on foot, in homely and independent fashion, with fossil bag and hammer on his back, he pushed his minute observations during a series of years not only through the greater part of the British Isles, but over considerable tracts of the Rhenish provinces and of the Alps. In this way, by the labour of his own hand, grew in great measure the noble collection of fossils of which Mr. Woodward's bequest formed the nucleus, arranged and classified by himself and his lamented coadjutor, Professor McCoy, whose systematic description of the series was incorporated with Sedgwick's splendid *Synopsis*. Among his latest public acts, on relinquishing the active duties of the chair which he had filled with efficiency and honour fifty years, was the presentation to the University of the valuable accumulations of his long life. Beyond the legacy of this rich and well-ordered repertory from the book of nature, beyond even the copious and suggestive expositions or comments which he brought by his pen to the understanding and the illustrating of the correlative physical truths, he has left his impress upon the large and earnest body of students whom he trained in his own exact and conscientious methods and kindled by his own warm and glowing spirit.

To give a summary of Professor Sedgwick's contributions to the scientific periodicals of his time would be to epitomize the progress of geological discovery for half a century. Conspicuous among these were his papers on the Magnesian Limestone of the North of England, on the Trap Rocks of Durham and Cumberland, with his description of the mountains of that district and the ranges adjoining, as well as those of North Wales, and on the fossiliferous strata of the North of Scotland, and of the Isle of Arran. The culminating point of his multifarious work was perhaps that in which he reduced to order and unity the entire geology of North Wales, making Cambria as distinct a conquest of his own as Murchison contemporaneously made Siluria. Efforts were made by him to secure for the word "system" a more definite and positive place in scientific nomenclature, restricting it to the threefold division of fossiliferous rocks, which on palæontological grounds were to be distinguished as palæozoic, mesozoic, and cænozoic. Of the Cambrian "series" he would speak as coming under the first of these systems. In the introduction to the most prominent and handsome of his independent publications, his *Synopsis of the British Palæozoic Rocks*, which contains the fullest available retrospect of his labours up to that period (1855), Sedgwick challenged with energy the propriety of the name "Silurian system," as applied by the great subjugator of the Southern principality, who had, moreover, as our Professor indignantly pleaded, swept into his new kingdom of Siluria the entire group of Cambrian rocks. The typical Llandilo flag had been put in a wrong relation to the Upper Bala group by a positive inversion of the sections, and it was put into no less erroneous a relation to the Wenlock group by a misconception of the sections, which did not show a consecutive and complete succession, but one which was broken and discordant. The true Silurian base was to be sought, argued Sedgwick, in the May Hill Sandstone. When he passed below this point, among the vast and complicated groups of Cambria, with which he was then imperfectly acquainted, the author of Siluria "neither rightly interpreted the Caradoc group, nor did he define even with approximate truth the place of the Llandilo group in the great Cambrian series." With what might be taken for jealousy or asperity of temper but for his known constitutional *bonhomie*, and the unbroken harmony of their friendship, Sedgwick proceeds to dispute his friend's identification of the older fossil-bearing rocks of Russia with the Silurian system. The new name Permian, from the ancient Russian kingdom so-called, jarred upon his prepossessions for all things English, besides setting aside in our own Palæozoic series what he considered a far more perfect type for comparison with the corresponding rocks of France and Germany. The Silurian system became in his eyes no longer a philosophic scheme worked out on principle and defined by admitted facts; but "Siluria became a region undefined and expansible—capable of absorbing within itself, right or wrong, all neigh-

bouring countries which had with it any community of character or language." This is now an old controversy which any one may see closed by reference to the later editions of "Siluria," or to the writings of Lyell, Phillips, or Ramsay. But for the study of character the episode is one which deserves to be kept alive. Another subject on which much independent light was thrown by Sedgwick's researches was that of slaty cleavage. In the same introduction he recounts the difficulties thrown by this intricate problem in the way of his analysis of the Palæozoic rocks. As a general conclusion he made out the cleavage planes to be the result of a crystalline, and not of a merely mechanical, motion. Modified as his views have been as well as expanded by later study of this class of phenomena, to him belongs the credit of having made good at least the basis of facts on which the problem rests for ultimate solution.

The bent of Sedgwick's intellect and will was towards the immediate and practical, rather than the theoretical and more remote aspects of natural phenomena. His energies were given to amassing the plain and solid facts which lay beneath his feet rather than to soaring to heights of speculation, or surveying in the aggregate, with more ambitious or imaginative students, the realm of universal nature. With what would seem to many a dull and plodding step, he trod in the path of patient observation and careful discovery, not exercising himself over much in great matters, but heedful of every point of detail. Cautious in every generalization, making sure of every stage in the process of induction, he worked his way to wide and substantial results by sheer effort of poising and setting down his foot upon every stepping stone of knowledge as he proceeded to test it and feel its solidity. Of jumping to conclusions by mere quickness of appreciation, or intuitive force of reasoning, he had a constitutional horror. Upon anything like mere theorizing in advance or in the absence of facts he had no mercy. With a kind of John Bullishness, he turned upon those who would make the hidden things or unknown tracts of nature the playground for a lively fancy, or the stage for showing off that nimbleness or versatility of mind which often passes for genius. This antipathy of his may serve in great measure to explain what might be thought the undue strictness, if not savageness, of an article upon the *Vestiges of Creation* in the *Edinburgh Review* which has by common consent been ascribed to Sedgwick's pen. This work, provokingly rash, and wanting in that seriousness and humility of mood in which matters of such depth and moment should in his view be approached or weighed, while it seemed clever and suggestive, was essentially crude and fanciful, and was resented by the reviewer as an offence to his rigid insistence upon facts, and as insulting the severity of his regard to truth by its lightness of heart in entering on the campaign of cosmical investigation. It is still worthy of note with what tenacity the authorship of the *Vestiges* has been kept a secret. It seems likely to go down in the long line of historic doubts along with the "Junius" mystery. The late Robert Chambers, who had seen the work set down to him in catalogues without number, yet had never uttered a word of protest or disclaimer, could, on his death-bed, be brought by those most near and dear to him who pressed him with the question no nearer than to reply, with a twinkle of that humour which had belonged to him through life, "So they all say!" Could the *Edinburgh* Reviewer have turned again to the subject with fresher powers, and with the light which later progress in research and thought has thrown upon the mysteries of biology, there are doubtless many points in the doctrine of evolution which would have been seen by him in a different aspect, and much that he deemed worthy of intellectual scorn and moral reprobation would have been allowed to call for more patient analysis and more philosophical respect.

With much the same blending of care for established landmarks and warm solicitude for the sound and progressive culture of his favourite physical studies, Professor Sedgwick put forth his *Discourse on the Studies of the University*, which grew from a College chapel sermon, preached in 1832, into a substantial treatise—the fifth edition, in 1850, extending over three hundred pages. In his later matter he returned to the controversy about spontaneous generation, transmutation of species, and similar points upon which the *Vestiges* had dogmatized with a freedom which seemed to him to war against Scriptural and moral truth; at the same time he stood up stoutly against what he considered fanatical objections to the study of physical science, and in favour of the entire harmony between natural law and the divine rule in nature and morals. With his attack on materialism in philosophy he combined strictures upon the utilitarian school of ethics, which gave occasion to as sharp a rejoinder from the pen of Mr. Mill, in the *London Review* for April 1835, reprinted in Vol. I. of his *Dissertations and Discussions*. Allowing his opponent to be no mere college pedant, nor a bigoted, albeit an intemperate, partisan of things as they are, Mr. Mill concludes himself to have proved by his criticism that the Cambridge Professor's name and reputation are his only claims to be heard on such a subject, disputing his definition of the utilitarian system, and making light of his powers of reasoning and expression. It cannot be said that philosophy in the broad or comprehensive sense of the word was the field for the true exercise of Sedgwick's talents. The powers of analysis, and of co-ordination of facts and principles, whether in physical or ethical speculation, were subordinate in him to the results got at once by common sense, or resting upon received and immemorial usage. If the stubborn conservatism of his nature lent some force to his critic's sarcastic saying that he was one of a class who never take the trouble to set before themselves fairly an opinion which they have an aversion to, it must be pleaded that the fault lay in no want of candour or of devotion to truth, but in the constitution of an intellect which was vigorous and clear rather than deep and many-sided. Solid more than brilliant, patient and accurate rather than quick and far-reaching, his intellect was of the class which furnishes good teachers in detail rather than master spirits over the upper realm of philosophy. In the chair which he held till his death, discharging its active duties with all but unabated energy till within the last two years, Sedgwick was emphatically in the right place. Clear and vigorous in exposition, kindling the enthusiasm of his class by the geniality of his manner and his evident love for his subject, unfailing in courtesy and attention to the dullest or most trying of his pupils, Professor Sedgwick has made for himself a memorial in the grateful recollection of generations of Cambridge men such as has been denied to many men of distinction in University life more brilliant or varied in their attainments, as well as more conspicuous in their fame.

AN ECONOMICAL PROBLEM.

A CONTROVERSY has recently been raging in the *Pall Mall Gazette* which illustrates rather curiously an economical fallacy remarkable for its extraordinary vitality. It originated in a reproof administered to Mr. Goldwin Smith by the able writer who uses the signature "W. R. G." Mr. Goldwin Smith spoke of a rich man "consuming the income of six hundred poor families." If this means anything, says "W. R. G.," it means that a nobleman who spends 30,000*l.* a-year consumes an amount of sustenance which would maintain six hundred families. "Of course," adds "W. R. G.," "Mr. Goldwin Smith does not really think this, or would not think it if he gave himself time for reflection." Reflection would show, in fact, that the nobleman by spending money on bread and meat maintains the butcher and the baker and all the labourers dependent upon them. After giving various illustrations, "W. R. G." asserts that, "whether a man of 30,000*l.* a-year spends his money lavishly or invests it sagaciously, it is equally and necessarily employed in remunerating labour"; and he ends by the assertion that these are "hackneyed as well as obvious considerations," and by expressing surprise that it should be necessary to suggest them to "so competent and accomplished a thinker as Mr. Goldwin Smith." Hereupon arose the controversy of which we have spoken, and which it is unnecessary to follow in detail. We have no desire to enter into the irrelevant question whether the conclusions drawn by Mr. Goldwin Smith were right or wrong, or whether his assault upon the rich man was justifiable upon moral grounds. But we will consider as carefully as our limits will permit the precise issue raised by "W. R. G."; for the doctrines which he advocates, whether fallacious or otherwise, are to be met with in a great variety of shapes, and a right understanding of them is of primary importance to any sound views of economical questions.

We begin, however, by remarking that "W. R. G." is radically opposed to the highest authority in Political Economy. He says, as we have seen, in so many words, that it makes no difference to the labourer whether a man spends his money lavishly or invests it judiciously. Mr. Mill, on the other hand—and Mr. Mill is followed by the great body of orthodox economists—maintains that demand for commodities is not demand for labour; or, in other words, that whereas a "lavish expenditure," by which we presume is meant an expenditure on luxuries, does no good at all to the labourer, a judicious investment is so much more put into the pockets of the labouring classes. Mr. Mill's doctrine seems to some people to have a paradoxical sound; and yet "W. R. G." certainly maintains a still more startling paradox. He appears to say that it makes no difference whether a rich man pitches his money to the dogs or spends it in making railways. The spendthrift, the man who distributes all his means in charity, and the judicious employer of labour are all precisely on a level; and this is, in "W. R. G.'s" view, a "beautiful arrangement of Providence." It sounds at first sight more like a very immoral fatalism. Surely it is no compliment to Providence to say that we are under an invincible necessity of producing the same good to our neighbours whatever our mode of managing our property. Are the nobleman who ruins himself by horse-racing, the nobleman who builds himself a sumptuous palace, and the nobleman who reclaims a waste province all to be reckoned, so far as economical considerations are concerned, as equally useful members of society? Surely this is a very hard doctrine.

We are indeed tolerably familiar with "W. R. G.'s" theory. It was frequently expressed by Pope. After describing the "lavish expenditure" of Timon, supposed to represent the Duke of Chandos, the poet adds:—

> Yet hence the poor are clothed, the hungry fed,
> Health to himself and to his infants bread
> The labourer bears. What his hard heart denies
> His charitable vanity supplies.

And Pope's doctrine, which is identical with "W. R. G.'s," was expanded by Mandeville into an ingenious sophistry which puzzled all the ablest thinkers of the eighteenth century. That doctrine, in its simplest terms, was that consumption was equa-

lent to demand for labour. Mandeville—whose ghost, by the way, has written a very clever letter to the *Pall Mall Gazette*—pushed this theory to its logical extremes. He says that, useful as the Reformation has been, he doubts whether it has done more good to trade than the invention of hooped petticoats; and he maintains that the fire of London would probably be found to have done as much good as harm, if we could compare the complaints of the sufferers with the rejoicings of the many masons, carpenters, and bricklayers whom it set to work. The argument was so perplexing that even the extraordinary acuteness of Berkeley could suggest no better answer than that in the long run virtuous people consumed more than the wicked. And the same theory crops up whenever the Royal Family is attacked by some democratic shopkeeper for not spending more money in "encouraging trade."

To explain the nature of the argument, we will venture to make a simple hypothesis. Imagine velvet to be edible, so that a certain quantity might either be worn by a nobleman as a state dress, or might be eaten for breakfast by six hundred families. Then, if the nobleman systematically spends a certain part of his income on velvet, he may either convert it to his own use, or distribute it amongst his dependents. In the first case he will be the only person benefited. The whole result of the labour of the velvet-makers will be to add a certain amount of splendour to a nobleman's costume. In the second case, the same labour will be employed in the same way to provide six hundred families with breakfast. Obviously, then, it would be a simple expression of the fact to say that the nobleman consumed the breakfast of six hundred families; and "W. R. G." could not deny that the expenditure in one case led to purely selfish pleasure, whilst in the other it provided the support of a considerable population. Now to adapt this case to the reality we have only to suppose that one nobleman pays a certain sum for luxuries, whilst another spends the same sum by distributing it amongst his dependents. In the first case a certain amount of capital and labour will be told off to produce the luxuries demanded by the nobleman; in the second case the same amount of labour and capital will be told off to produce the bread, bacon, or beer, demanded by the poor recipients of the charity. It is impossible to maintain that the labouring class does not benefit to the extent of the money which formerly caused luxuries to be produced, and which now causes the production of the means of subsistence. There is of course a third case, in which our imaginary nobleman does not give away his money, but employs those to whom it is given in some useful labour. In this case an addition is made to the capital productively employed.

Thus, so far from all modes of expenditure being equally profitable, there are three well marked stages. In the first, a certain part of the whole energy of society is employed in producing commodities destined to give pleasure to one man; in the next, the same energy is employed in producing commodities destined to support a number of idle people; and in the third, it is employed in supporting people who are themselves adding to the total wealth of the country. Whatever part of a nobleman's personal expenditure is devoted to maintaining servants or other dependents is of course added to the demand for labour, though of unproductive labour; but whatever part is devoted to mere luxuries is necessarily spent upon himself, and so far may be rightly considered as consuming what might otherwise maintain a certain number of poor people.

The ordinary fallacy arises from a very simple cause. People do not observe that everybody spends his whole income in one way or another—for we need not consider the old practice of putting money in a stocking. The Coventry riband-makers complain that the change of fashion leaves them unemployed. But they do not perceive that the money which formerly kept them at work now keeps somebody else at work. They are really asking, though they do not perceive it, that they shall be employed instead of, say, the bakers; and they therefore fancy that the interests of the labouring class at large are being injured, when the real fact is that the demand only changes the distribution of the funds employed in supporting labour, and not the whole amount of those funds. And hence it is inferred that to stimulate consumption is equivalent to encouraging production. The production remains constant, but in one of the above cases luxuries are produced, and in the other case, loaves. Still more natural and still more unreasonable is the complaint against saving instead of spending. Whatever is saved is spent, and is spent more usefully to the labourer. Whether it is directly invested by the owner, or left in the hands of a banker to be invested by him, saving means the employment of more labourers. The money is now spent in making railways, or draining land, or in some other productive expenditure. There is an additional demand for labour and an additional production of commodities. In short, in this as in almost every economical fallacy, the error consists in looking at the immediate result, and not tracing out the complex train of consequences which is set up in the whole intricate network of society.

"W. R. G.'s" attempts to escape these conclusions are not very felicitous. First, he asks if a rich man spends his money in gratuitous distribution, would he be "consuming the income" of the labourers? Certainly not. As we have just shown, such expenditure would be economically to their immediate advantage, however bad its ultimate results. And therefore Mr. Goldwin Smith should have said, not that the rich man consumes, but that the rich man and his personal dependents consume, the income of six hundred families. With this correction the assertion is perfectly accurate, and is not met by "W. R. G.'s" statement. "It may possibly be," adds "W. R. G.," that the rich man would spend his money more beneficially if he employed his labourers in reclaiming waste lands than in making carriages. We add that he would spend it more beneficially to himself if he employed them in making carriages than doing nothing; and more beneficially to the labourers—so far as the immediate results are concerned—if he employed men to do nothing than if he spent the money on luxuries. Finally, a writer signing himself "Catallacticus" asks whether national expenditure on an army be not a consumption of the means of the poor. No, says "W. R. G.," for an army is a necessary condition of the security of labour. This is quite true, and would be relevant if "Catallacticus" had proposed to abolish the army. But from a purely economical point of view "W. R. G.'s" argument is irrelevant. The question is simply whether, other things being the same, an expenditure on an army is not deducted from the means of the poor man. The answer on our principles is plain. The military expenditure is simply a case of expenditure on unproductive labour, using the word "unproductive" in an economical sense. That is, it is better for the labouring classes than expenditure on luxury, and worse than expenditure on productive labour. In so far as the taxes are raised from capital, or discourage the accumulation of capital, its immediate economical effect is injurious; in so far as they are raised from the expenditure on luxuries, it is beneficial to the labouring classes. An army, therefore, is, as common sense tells us, a burden on the country, though it is frequently a burden worth bearing. The United States would be poorer if they insisted on maintaining a million of men in arms, though it may perhaps be essentially necessary for France or Prussia to keep up such a force in view of ulterior consequences. But nobody can deny that the maintenance of the vast military establishments of the Continent is a severe drain on the resources of the countries which support them. Were "W. R. G.'s" principles well founded, it would make no difference whether the same sums were spent in making railways, or in keeping up armies, or in buying pictures.

We can only say, therefore, that "W. R. G.," in spite of his undeniable acuteness, has fallen into economical paradoxes greater and more pernicious than those of Mr. Goldwin Smith. And we may conclude in his own language, "All these are hackneyed as well as obvious considerations. It should not have been needful to recall them to the recollection of so competent and accomplished a thinker as" "W. R. G." In saying which, however, we neither deny nor assert that Mr. Goldwin Smith may have made worse use of his truths than "W. R. G." has made of his fallacies. Our only object has been to decide which is right on the abstract question, without asking what false inferences may be drawn by illogical people from true principles.

THE DIVORCE COURT.

THERE is an ancient fable that Jupiter made men and women in pairs like Siamese twins, but that they grew so powerful and presumptuous, and gave so much trouble to Olympus, that he had to cut them in two. Ever since each sex has had quite enough to do to keep the other sex in order. It would appear from the records of the Divorce Court that there are a considerable number of married couples in this country who are quite disposed to fall in with Jupiter's views. The Divorce Court has already used up a couple of judges. The second broke down under the pressure of his work only a few months ago, and now his successor is already crying out about the overwhelming amount of business constantly pouring into the Court. Sir J. Hannen says he really does not know how he will be able to cope with it. He is getting on so slowly that he has almost begun to despair of clearing off the list. It is like counting the sands, or filling up a bottomless pit. Every day fresh causes are added to the roll, and every term there is a longer and longer list. The Judge has done all in his power to economize time. He has cut down all superfluous forms, and works as fast as he can. He takes his seat earlier in the morning and sits later at night than either of his predecessors used to do. And yet he is able to make hardly any perceptible impression on the flood of business which is continually pouring in, and which fairly swamps the Court. The energies of a single judge cannot keep pace with the busy wickedness of the community. If things go on in this way, the Court will have to sit day and night, and there must be relays of judges. The double shift system would seem to be wanted at the upper end of Westminster Hall even more urgently than in the Welsh collieries. The present condition of this unhappy tribunal certainly deserves attention. Out of a list of 243 divorce causes without juries, only 50 have been disposed of, and there are 27 special jury causes and 44 common jury causes besides. As all the jury causes are contested they will necessarily occupy a good deal of time. And all this while new causes are continually being set down. The Judge, if his present fit of despondency continues, may perhaps be tempted to give up even the long vacation, which in a race with loose married couples certainly places him somewhat at a disadvantage. The Court is a kind of double-barrelled affair, combining probate and divorce business, and there is a good stock of probate work on hand. The new practice of giving costs out of the estate in almost every case of a disputed will can hardly fail to produce an enormous increase of litigation. It may be taken

as a fixed general principle that, when there is any property worth thinking about, no will that could possibly be devised will give universal satisfaction. There are sure to be some people left out, or others who think they should have had more; and disappointed relatives are always prone to suspect the sanity of the testator or the genuineness of the will. For the sake of social harmony and domestic peace, it is not desirable that litigation about wills should receive encouragement. If costs follow the decision, there is a certain check on rash and reckless suits; but if costs are, as a rule, to be paid out of the estate, there is no reason why every will should not be fought by somebody or other, there being always a chance, however slight, of getting something, and no danger of losing anything. The race of speculative attorneys is not yet extinct, and experts are always to be had when there is money to pay them with. With costs and fees guaranteed beforehand, the lawyers and mad doctors should have a nice time before them. An appeal will probably be made to the Government for an increase of judicial power for this Court, and it will be an appeal difficult to resist. Three judges for the Divorce, Probate, and Admiralty Courts would make the ordinary work comparatively easy, and would provide an efficient Appeal Court, instead of the farce which now goes by that name.

When the Divorce Court was first established it was calculated by distinguished authorities that perhaps there might be as many as from eighteen to twenty cases in a year. There were more cases than that to begin with; but this was supposed to be only an accumulation of old domestic troubles. There must be a good many wretched people, it was said, who could not afford the luxury of going to the House of Lords, and who would naturally be eager to avail themselves of the cheap and handy facilities of the Divorce Court. But when once these arrears were exhausted, the ordinary course of business would be found to be moderate enough. This pretty theory has long been blown to the winds. Year after year the number of causes has been continually increasing, and at last there is an utter deadlock of business, suitors are growing mutinous, and the Judge publicly confesses his despair. We can fancy the vast cloud of sinners and victims overflowing the Court, filling Westminster Hall, and stretching up Parliament Street almost to Charing Cross. It is an interesting question how far the existence of the Court and the facilities it offers for separation have had an effect in attracting suitors. The late Judge Ordinary did not hesitate to declare that in his opinion the possibility of freedom begets the desire to be set free, and that the great evil of a marriage dissolved is that it loosens the bonds of so many other marriages. There can hardly be any reasonable doubt that the Divorce Court has a tendency to provide itself with business in this way. When people feel that they are bound for life, they naturally try to make the best of each other, and to adjust the yoke in the easiest manner. But the possibility of release is apt to set the mind brooding and scheming on the hope of it. The number of cases in which the Queen's Proctor intervenes would seem to be increasing, and the appearance of the Queen's Proctor implies of course a pretty strong suspicion of collusion. Some light might possibly be thrown on the working of the Court if we knew the number of reappearances there. There are, we fancy, not a few cases of divorced husbands and wives trying their luck with other partners, and finding their way back to the familiar tribunal. Sometimes the same couple have got married again, and, making a fresh start, have fancied themselves the better for it. There is a tradition, belonging of course to quite other days, of a case where the reunited couple defrayed the expenses of a second honeymoon out of the handsome damages awarded to the injured but forgiving husband. One of the most touching passages of Thackeray's finest novel is a picture of the forlorn wretchedness of poor Lady Clara when she fled from her brutal husband with her only friend. All the sisterhood of friendship was cut off from her. She scarcely dared to look out of the windows of her new home upon the world lest it should know and reproach her. It may be doubted whether the *divorcées* of the present day have quite such a dismal time of it. There are almost enough of them to make a society of their own—a society which has its grades and circles, and holds up its head in its own fashion. It might be supposed that any one who had passed through the experiences which end in a decree of divorce would be disposed to hang it up, as the shipwrecked voyager did his dripping gown, to warn him from tempting fate in the same way again. It is probable, however, that in the majority of cases a new match has been arranged before the old one is broken off.

It would perhaps be too much to expect that, in the face of these unsavoury records, the British Pharisee should abate any of his self-righteousness or congratulation that he is not as other men, not as those wicked French people or those Free-love Americans. It is true we are still a good way behind Indiana, where divorces are said to be issued at the rate of some two thousand a-year. Our law is rather straitlaced as yet, and we have not got the length of authorising divorces for any cause which the judge may happen to think sufficient. Nor are we disturbed like those poor French folk with morbid controversies as to whether it is not better to kill an unfaithful wife out of hand. Very likely the Lord Chamberlain will object to "Claude's Wife" being shot on the English stage. We manage things, as we fancy, in a much more decorous, certainly in a much more business-like, way, though demands for damages are rather going out of fashion. The commonness of divorce may possibly in time have one good effect. It may somewhat check the trade in nastiness for which the newspapers find their materials in divorce trials. Divorces by the hundred must surely pall even upon the most morbid appetite. The chronicles of this unsavoury tribunal scarcely bear out the pictures of a certain school of fiction in regard to the comparative morals of the different classes of society. The hero of these scandals is not always a lord, or even a lord's second cousin. We do not find that the upper classes altogether monopolize the attentions of the over-worked judge. Certain newspapers, it is true, do not fail to make the most of any scandal of the great that may crop up in this way; and the peerage and baronetage enjoy the privilege of having their misdeeds and misfortunes, to say nothing of some other accidents, reported in detail for the edification of the multitude. On the other hand, the working classes do not trouble the Court very much. Divorces still cost more money than they can afford, and the marriage tie lies so lightly on semi-detached couples of their class, that it is hardly worth their while to ask the Court to undo it for them. The records of the Poor-law and of the police courts tell how frequently in this sphere husband and wife are found living apart; and too often their respect for marriage is shown in a weakness for bigamy. It is the middle classes, the respectable, sanctimonious middle classes, who mainly keep up the steadygoing business of the Divorce Court. We have heard Scotchmen argue that the statistics of illegitimacy in the North attest conclusively the superior chastity of the population, and we shall hardly be surprised to hear a similar explanation of the throng of middle-class couples in the Divorce Court. An expert in these matters is said to have pointed to drink and mothers-in-law as the chief agents in bringing about that condition of conjugal affairs which is apt to end in decrees *nisi*. A rough and ready generalization would perhaps lead us to the conclusion that disasters of this kind seldom happen without faults on both sides; but it is impossible to shut our eyes to unpleasant symptoms of a somewhat dangerous degradation of moral tone, and disposition to make light of the obligations of marriage and the sacred union which it involves. The operation of the Divorce Court may perhaps serve as a warning against the agitations now in progress for destroying the unity of marriage, in regard both to property and kinship.

THE ELECTION OF THE SWISS FEDERAL COUNCIL.

WE have marked with pleasure that more frequent notices of the affairs of the Swiss Confederation have of late been given in certain English quarters, and that a remarkable improvement has also been made in the degree of intelligence and accuracy shown in such notices as have been given. The telegrams, to be sure, remain hopeless; the general reader who goes no further will still be tempted to mistake the cantonal affairs of Geneva for the affairs of the whole Confederation. But, for two or three months past, very reasonable accounts of Federal matters have appeared in places where, to say the least, their appearance is quite a new thing. It would perhaps be rating ourselves too highly if we were to venture to hint that we may ourselves have had some hand in this happy reform. A gentle admonition, unpleasant as it may be at the time, does sometimes work improvement in the long run; and if the admonition should even go so far as to take the shape of a kind of metaphorical tunding, it may even be the more deeply impressed on the memory. Our wise forefathers grasped this truth, though the particular application of it might savour of injustice, when they caused boys to be whipped at the beating of boundaries, and sometimes also on other solemn occasions when it was wished that something should be specially kept up in the public memory. No doubt, when their turn came, they would have the satisfaction of handing on the tradition by whipping the boys of another generation; and we shall be neither surprised nor grieved if we should some day see the wholesome process which we cannot help thinking we have set on foot carried on a little further by the hands which have first profited by it. Anyhow we have a pleasure in seeing that the affairs of the one republican state in Europe, perhaps the most successful republican state in the world, the state where the oldest and the newest elements of political life may be seen working together side by side, are at last drawing to themselves some share in English attention. We shall not become less attached to the form of government which the events of our own history have given us, by studying the utterly different form of government which the events of their history have in the like way given to a kindred people. It need shake no man's loyalty to an historic monarchy of England if he learns that the citizens of a republic are not always engaged in cutting one another's throats, and that democracy does not, as a matter of course, carry with it the confiscation of private, or even of corporate, property.

It will be remembered that the elaborate scheme for reform of the Federal Constitution which, after debates throughout the winter, passed the two Houses of the Assembly last March, was thrown out both by the popular and cantonal vote in the *plebiscitum* of May; that is to say, the people gave the conservative vote, the vote that things should stay as they were. On this in the autumn followed the general election, and the general election issued in the return of a National Council in which there is a strong revisionist majority. There may at first seem to be some inconsistency in this, as if the Swiss people repented of their rejection of the scheme of revision. But the election of a National Council whose majority is revisionist proves nothing of the kind. What it does prove is how com-

pletely the last Assembly threw away its own chances of success by insisting that the popular vote should be taken *in globo*. Those who were absolutely opposed to any revision on any point must have been a small minority in the country as well as in the Assembly. What men did object to was to be called on to decide by a single vote on a heap of proposals on all manner of incongruous subjects, some of which they approved, and some of which they disapproved. Each of the various proposals, educational, legal, military, financial, and strictly constitutional, would have had a far better chance of being carried, if it had been put by itself, than the whole scheme had when it was put as a whole. All who objected to any part of the scheme naturally voted against the whole. But in so doing they in no way pledged themselves to oppose all revision in every shape, and there is therefore no inconsistency in a nation which has rejected a particular scheme of revision immediately electing a National Council the majority of whose members are pledged to a revision of some kind, but not necessarily to a revision of the same kind as that which has been thrown out.

The state of things at this moment is this. The National Council, by a majority which may be called unanimous, since only one member voted against it, has addressed the Federal Council, requesting them to bring forward a scheme of revision before the Assembly. That is all. The thing begins afresh; the Executive Government is requested to make what proposals it pleases, without any reference to what has passed. A moderate scheme of revision will be safe to pass the Assembly; and, if it is put in such a shape that men can vote separately on the several heads of the scheme, there seems little doubt that it will be accepted by the people also. But all this will not be done just yet. It is not likely that the Federal Government will propose anything till another session; so there is plenty of time for men to think calmly over the whole matter.

But what we wish specially to speak of now is, not the possible action of the Federal Council which has just been elected, but the Federal Council itself. The two chief Federal Commonwealths of the world were engaged about the same time in deciding in what hands the executive power of the Union should be placed for the next legal term; in the one case for four years, in the other for three. But the difference between the two processes, between the election of the American President and the election of the Swiss Federal Council, is as marked as may be. They agree only in this, that the executive elected must, under all ordinary circumstances, go on for a term fixed by the law, but cannot go on beyond that term without a fresh formal election. In this the two Federal executives are distinguished alike from Kings who stay on for the terms of their natural lives, and from Ministers whose term of power may be cut short at any moment, or may be prolonged for any length of time, according to the directly or indirectly expressed will of the Legislature. But, beyond this, there seems to be no likeness whatever between the way of appointing the executives to the two Confederations, and not much between their duties when they are appointed. The American executive is a single man; the Swiss executive is a Council of seven. Students of constitutional politics have pointed out how the Swiss arrangement at once hinders the Commonwealth from making the most of a great man, and saves it from the degradation into which it might be led by a small man. But, as things go on in the world in general, and especially as things go in a state so placed as Switzerland is, it is perhaps worth while to give up the chance of being ruled by a Washington in order to be quite safe against being ruled by a Pierce. Then again, a single-headed President must have something of a Ministry, because he cannot do everything with his own hands; and such a Ministry is apt to grow, in a sort of underhand way, into the position which the Constitution meant for the President himself. But in Switzerland the Federal Council is a Ministry ready made. The actual management of the departments of state is really in the hands of those whom the Constitution entrusts with power. But the main difference is in the manner of election. Every one knows that the American President was meant by the founders of the American Constitution to be elected in one way; but that, as a matter of fact, he is, without any change in the law, without any breach of the law, elected in quite another way. The founders of the Constitution thought that the Legislature or people of each State would really choose those whom they could best trust to elect a President, and would leave them freely to elect him. Experience has shown that the election of Electors has become a mere farce; that the choice of the President is really decided by the popular vote, and that the only result of the form of choosing intermediate Electors is—whether we think this a good or a bad thing—that a President, after all, may be chosen who has not a numerical majority of a people in his favour. Add to this the necessary consequences of a popular vote taken throughout a large country—namely, the party struggle in its extremest form, and the further consequences of caucuses and conventions, the strong chance that no party will find it convenient to bring forward its best man, the certainty that many men of every party will, for the sake of party allegiance, vote for some one whom they do not think the best man. And when the President is elected, he is, as being himself the result of a popular vote, as much the representative of the people as Congress is. The executive and legislative powers are set up, as it were, on two equal pedestals, as if on purpose to suggest the thought of rivalry with one another. In the Swiss system all these disadvantages are avoided. The founders of the Swiss Constitution, while they made the two Houses of the Assembly so closely after the American model, added an Executive wholly of their own devising. The Federal Council is elected, not by the people, not by the Cantons, not by special electors, but by the Legislative Assembly itself, the two Houses for this purpose voting as one body. And the mode of voting which is chosen is one that gives every member the fullest opportunity for voting for the men whom he honestly thinks the best. In England, we should probably have some proposing of candidates; each member would vote for a list of seven, the lists being in most cases lists arranged beforehand according to parties. In the Swiss way of voting, each of the seven seats in the Council is filled separately; and for a candidate to be elected he must have an absolute majority of the members voting. It is therefore possible that two or three votes may be taken before each vacancy is filled, and it is plain that, in the first voting for the first place, it is open to every member to vote for the man whom he personally thinks the best of all. If his favourite is elected, he has still his other votes for those whom he thinks next in merit; and if his favourite fails, he can judge from the result of the first voting whether it is worth while for him to vote for him a second time. Thus, at the late election, December 9, the voting for the first place gave an overwhelming majority for Herr Welti, the *Bundespräsident* of the last year. He polled 126 votes to 33 divided among twelve other candidates, among whom the highest number of votes given for any one was 9. Those 9 were given for Herr Scherer, a member of the outgoing Council, followed by 6 votes for Cérésole and 5 for Schenk. The election to the second place showed a warm contest between these three, the votes given being Cérésole 75, Schenk 43, Scherer 25, beside scattering votes. Here is no absolute majority, but on a second voting Cérésole comes in with 122 votes, with 26 for Schenk, and 11 for Scherer; the third voting brings in Schenk, the fourth brings in Scherer, the fifth brings in Knüsel, who had not appeared as a serious candidate till the fourth voting. It is evident that all this time there has been no serious party struggle. Members of the old Council, to none of whom there was any serious opposition, were re-elected, the only question being as to their relative merits, perhaps as to which was least opposed to the opposite side. But on the sixth voting there was a real stand-up fight between parties. M. Challet-Venel of Geneva, a member of the outgoing Council who had been strongly opposed to the late scheme of revision, was opposed by M. Borel of Neufchâtel, a revisionist. The first voting gave Challet-Venel a majority, but not an absolute majority; he polled 65 and Borel, 59; while 45 were divided between other candidates, the highest being Herr Anderwert, with 25. On the second voting Borel had 90, Challet-Venel 73, 5 only being thrown away. For the seventh place there was a struggle of the same kind between Näff and Anderwert, which ended in the election of Näff. There were a few members who went on to the end giving scattering votes which could not help any cause. The result is that the old Council is re-elected, with the exception of the substitution of M. Borel for Challet-Venel. The only other serious attempt to throw out a member of the old Council in the person of Herr Näff has been unsuccessful, and it is to be noted that the proportion between the German and the Romance-speaking members of the Council is kept by the substitution of a member from Neufchâtel for a member of Geneva.

This is an eminently fair way of voting, and it showed the good sense of the Assembly when it determined to cleave to it, and threw out a motion for voting by lists. In an Assembly where there are marked party divisions, the list comes to a mere voting for the Liberal or Conservative ticket; in an Assembly where party divisions are not strong, as in a Court of Quarter Sessions, there is a natural unwillingness to oppose a list except on very strong grounds; its proposer therefore has an unfair advantage, and may take the Assembly by surprise. But in the Swiss way—not that it is at all distinctively Swiss—each man who votes can vote purely according to his own convictions, modified by what the course of the voting reveals as to the chances of the candidates. If a few members steadily persisted to the end in throwing away their votes, it only shows that no Assembly is wholly made up of wise men.

But far more important than the mere way of voting, which can be altered at any time by the Assembly for the time being, are the relations which the constitution establishes between the legislative and the executive power. They are wedded to one another for three years without power of divorce: the Federal Council cannot dissolve the Assembly and the Assembly cannot turn out the Federal Council. So far their relations are the same as those of the American President and Congress. But then the President and Congress may easily become rival powers; they stand apart from one another; they never meet face to face; the President has a modified veto, which may lead to disputes between him and Congress. But the Swiss Federal Council is, as we have seen, chosen by the Assembly itself, and chosen in a way which makes it as likely as anything can be in an imperfect world that the best men will be chosen. The Federal Council has no veto on the acts of the Assembly, and its powers in several other respects are less than those of the American President; but, on the other hand, the Federal Councillors, though they cannot vote, may, and often do, attend and speak in either House of the Assembly. In this way the relation between the Legislature and the Executive seems to be thoroughly friendly and confidential. The Legislature is never tempted to vote this or that way, not because it is in itself the best, but because it is likely to keep in or turn out a certain Ministry. The Executive, on the other hand, cannot influence the Legislature by the threat of a penal dissolution. The friendly

relations between the two branches are shown in such cases as the present, when the Legislature, though each House is fully competent to take the initiative in legislation, asks the Federal Council to give it a proposal to discuss. This is the obvious thing to do, when the Assembly has itself chosen the Federal Councillors as being the most likely people to make proposals which will be worth discussing.

It is surely no small work for any Constitution to have brought two of the three branches of the Government into such harmonious working. The weak point of the Swiss Constitution lies in the third branch—the Judiciary. Any new scheme of *Bundesrevision* must specially deal with that, and it must, before all things, hinder the time of both Executive and Legislature being any longer wasted on matters which ought simply to go to a judge and a jury.

THE DUNGENESS COLLISION.

AMONG shipwrecks and disasters at sea the loss of the emigrant ship *Northfleet* will hold a foremost place. The awakening from secure sleep to imminent danger, the confusion, the devotion of some to duty, and the selfishness of others, the apparent nearness of help that came not, the burning of unregarded signals in a crowded roadstead—all these circumstances compose a picture of almost unequalled terror. It has been well shown how, if order had been kept, the ship might have been saved. The expedient of stretching a sail over a hole has carried many a damaged ship thousands of miles in safety, and in this case it was only necessary to check the influx of water for the few hours of night. The want of some signal specially appropriated for urgent danger has been remarked upon; but it has been usual, at least in poetry, to assume that gun firing, if not hostile, conveyed an appeal for help. The blue lights which were freely burned conveyed to the mind of a cruising pilot the idea that one of his craft was wanted very much, or, as he expressed it, that "something extra" was going on. The same idea seems to have faintly stirred the mind of the watch on board a ship which was anchored at the distance of only three hundred yards, but, not being a pilot, the watch troubled himself no further about the matter. Some help came, but not enough. The anchorage was full of ships and every ship had boats, and the loss of three hundred lives by drowning in such a place is as if a man were to die for lack of surgery in Savile Row.

It seems as if the proverbial dangers of the deep had not been diminished, but only altered in character by civilization. There are more ships at sea, and therefore the chance of mischief by careless navigation becomes greater. In a moment the captain of a trader may find himself called upon to display qualities which would adorn the brightest page of the history of the Royal Navy. Indeed the merchant captain has to contend with a special difficulty, for neither his crew nor passengers can be restrained under exciting circumstances from conduct which the discipline of a man-of-war prevents. It is a great support of the authority under which you are placed to know that you may die if you obey an order, but certainly will die if you disobey it. The occurrence of such a calamity, distressing as it is, may afford comfort to those alarmists who perpetually announce that our naval skill and spirit are extinct. Circumstances occur in the most tranquil times to call for the cool courage which formerly won battles, and the quality is usually forthcoming. The expression of Her Majesty's feeling at the death of the brave Captain Knowles may call to mind the lines:—

> Now God be with him, said our King,
> Since it may no better be;
> I trust I have within this realm
> Five hundred as good as he.

The modest figure which we believe occurs in the ballad might with truth be magnified. There are not only hundreds, but thousands, of men in England of unheroic aspect who are capable of dying calmly at their duty, either on sea or land. We need not be disturbed either at Russian civility or German rudeness if the old sterling metal of our race underlies its modern polish. The devotion of Captain Knowles impresses us more from the pathetic circumstance of his parting from his newly-married wife. He put her into a boat, and must have felt that he could hardly hope to see her again. Thus peace produces the incidents, but happily also the courage and endurance, of war. The scene on board the sinking ship was strangely compounded of heroism and meanness. Yet the "navvies" who struggled for places in the boats were capable under other circumstances of cool disregard of danger. If each man had had a distinct duty, he would probably have done it faithfully, and herein this mournful incident of peace only too truly represents what occurs in war. Why do men stand firm at one time and run at another? Is it not because they feel, or do not feel, that steadfastness is likely to serve some useful purpose?

On the evening of Wednesday week there were two or three hundred ships at anchor off Dungeness. The prevailing westerly wind was the cause of this large collection of ships. As trade increases it becomes a serious matter to consider whether these roadsteads, where shelter is necessarily sought, cannot be enlarged. The mate of the pilot cutter *Princess* says that it was "a squally, dirty, dark night." At times he could see the riding-lights of the vessels, but at other times the rain and hail which fell hid the lights. His attention was drawn to the *Northfleet* by her burning blue lights, which is the usual signal for a pilot. He noticed that she had a bright riding-light burning. When he first saw her signals he was about a mile distant from her. As he approached he saw, by the help of the blue light, the people screaming and struggling on deck. The ship was sinking, her boats were full, and there was no sufficient help at hand. The cutter sent her boat, but before it got up the ship had sunk. The boat's crew could see the ship settling down, and the people floating about, and could hear their cries for help. They took off ten men from the rigging, conveyed them to the cutter, and returned for more. Other help arrived, but none came in time to save the greater number of passengers, who perished when the ship went down. The signals ought to have been seen and understood by some of the vessels anchored near, and if assistance had been promptly sent many more lives might have been saved. But it must be owned that forty-five minutes was a brief time for help to come. It is difficult to believe that the steamer which did the mischief was not culpably mismanaged; and if she remained seaworthy, she could have saved the crew of the vessel she destroyed. If the offender was, as suspected, the *Murillo*, it is known that she was able to make her way safely to Cadiz. Steamers traverse the ocean as cabs drive along Fleet Street—that is, without any conception that sailing-vessels in the one case, and pedestrians in the other, have any right to be anywhere. It is matter of common knowledge that, with a heavy westerly wind, Dungeness Roadstead will be full of ships, and a steamer traversing that anchorage is bound to expect to find vessels in her path. It is possible that this question, like others, has two sides to it; but we should think that the steamer could not acquit herself of gross negligence. In proportion to the sympathy that has been excited for the victims will be anger aroused against the authors of this calamity if they disclose themselves. It is highly improbable that they will be able to avoid detection, and if they expected to do this by making off, they committed at once a foolish and wicked act. The reckless conduct of powerful steamers is a growing cause of danger to sailing ships and fishing boats, and no effort ought to be spared for the detection, and, if possible, for the punishment, of such offenders. A ship anchored off Dungeness ought in ordinary weather to be safe, and it is intolerable that danger unforeseen and inevitable should arise from the mere caprice of a steamer to whom all the sea is open for her course. It may not be practicable to do more than raise an outcry against those who ought to pay both in purse and person for the destruction of a fine ship and three hundred lives, but the common sentiment of humanity cannot be disregarded nor the voice of conscience stifled among those who have done this deed. If the captain of the offending steamer be alive, his existence henceforward is not likely to be enviable. How many times better to have died like Captain Knowles than to live like the captain of this steamer!

An incident unusual in our age and country occurred during the terrible interval between the ship receiving the blow and sinking. In order to enforce his order to save the women first, Captain Knowles drew a revolver, and not only threatened to shoot the men who crowded into the boats, but actually did shoot one of them. This man, having narrowly escaped a first ball in his head, received a second in his knee, and now lies at the Dover Hospital. He is a single man, and was going out to Tasmania as a labourer. When he felt the shock of the collision he came on deck, and worked with the other passengers at the pumps until they saw that the water was too strong for them. As hope vanished the confusion on deck increased. But amid all was heard the voice of Captain Knowles, who, having seen his wife into one of the boats, stood at the wheel giving directions for saving life. "The women first; I'll shoot the man that dares to get into a boat." The narrator of course alleges that he was not the first to violate this order; but when other men entered the boats he saw no reason why he should not follow. So he jumped into a boat under the Captain's eye, was ordered out, refused to obey, and received a ball in his knee. He was right from a selfish point of view in preferring the chance of being shot to the certainty of being drowned. So he kept his place in the boat and saved his life. He states that the Captain would have shot another man, but the pistol missed fire. Before he could offer further resistance the boat was filled and cast off, and rowed to a tug-steamer which had just come up. Hardly had the boat got alongside when by the red light which the steamer burned the figure-head of the *Northfleet* was seen to sink slowly under water. The crowded stern rose up in the sea, and with a rushing sound almost immediately disappeared. The tug picked up thirty-four people. If she had arrived earlier, it seems probable that she might have rendered efficient aid. But the tragedy was too rapidly accomplished.

We hear so much of international arrangements, that perhaps it may not be too much to expect that civilized countries will arrive at a common understanding as to the punishment of a new sort of piracy. When a steamer comes into collision with a sailing-vessel the usual rule is said to be "to make clear off." Many a "missing" vessel has thus been sent to the bottom, and none left to tell the tale. The captain of the steamer does not know the name of the vessel he cut down, and he is never afterwards absolutely certain that he has destroyed life, whereas he knows that he has preserved his own professional reputation. Until a stringent law is enacted by general consent, making it a serious offence to leave a vessel after collision without rendering assistance, such cases as that of the *Northfleet* will continue to occur, and British vessels, being the most crowded, will be the most dangerous. It is to

little purpose that we suppress piracy and kidnapping in the Eastern Ocean if we tolerate a more outrageous form of maritime atrocity within sight of our own coast.

MR. SPURGEON ON FOREIGN RELIGION AND ART.

MR. SPURGEON'S record of his foreign experiences appears to have become an annual institution at the Metropolitan Tabernacle. We can quite conceive that it forms a pleasing interlude in "the simple preaching of the Gospel," which he declares to be his peculiar "gift," and an appropriate sequel to "the gigantic tea-party which met in the afternoon in the lower buildings," and adjourned at seven o'clock to the Tabernacle to see the great preacher appear in the character of—we suppose we need not apologize for quoting his own account of himself—well, of "a goose." Mr. Spurgeon began by assuring his hearers that "to him to deliver a lecture was the sternest of all toil"; that he never contemplated it without pain, or began it without hesitation, or finished it "without thinking he was a fool to attempt it, and should be a greater fool if he ever attempted it again." Still he liked to do it now and then as an exercise of Christian humility; though his gifts lay entirely in another line. Whenever his hearers saw a goose flying they might say, "That is exactly like Mr. Spurgeon when he is delivering a lecture." In short, notwithstanding his love of Christian humiliation, "he never would have given the lecture at all, but that the placards announcing it and other arrangements were made in his absence"—we suppose we are to infer, without his sanction. It would be rude to contradict Mr. Spurgeon, even if we felt any temptation to do so, and it is only due to him to say that, whatever other merits his lecture may or may not possess, it certainly possesses the merit of justifying to a remarkable degree his own preliminary description of what was to be expected of it. But even this solitary recommendation he is too modest to lay claim to as exclusively his own. "Lecturing on one's travels nowadays, even if one was up to the mark, was rather a puzzling task, when you just got into a railway carriage, were whirled to the end of your journey and got out again, and that was all you knew about it." What sort of task it is when one is *not* up to the mark his hearers were left to infer from what followed. Probably some of them may have agreed with him, as certainly will many of his readers, that "it is most absurd." One chance of being able to confer some "sparkle and vividness" on his recollections had indeed for a moment suggested itself, but—for reasons which his explanations only render the more mysterious—it unhappily passed away. "He had been in hopes at one time that the brigands would have got hold of him, but" even that fond hope of possible assassination was cruelly dashed to the ground, for "troops accompanied the expedition, and as there was no chance of brigands, he refused to go." What expedition is intended, or why the troops accompanied it, is not very clear. It cannot mean the expedition to Italy, for Mr. Spurgeon was already there; and if he planned some particular expedition with a view to enlarging his experiences by a study of brigand life *au naturel*—as seems to be implied—one hardly sees why the military escort was not declined. Or are we to understand that the Italian Government insists on manifesting its new-born zeal for freedom of conscience and gospel truth by forcing a guard of honour on the illustrious pastor of the Metropolitan Tabernacle whenever he visits their country? Be that as it may, the desired encounter with brigands which might have supplied "something entertaining" did not come off; "everything was reduced to the commonplace level of a railway carriage, an hotel, and perhaps an omnibus, or a cab or two," from which we infer that, as a general rule, the train set down Mr. Spurgeon at the door of his hotel. With such materials to work upon what could be achieved? *Ex nihilo nihil fit.* Not even to the greatest orator is it given to make a silk purse out of a sow's ear. And yet Mr. Spurgeon, as we have already observed, did make a very remarkable discourse—that is to say, a discourse which remarkably illustrated his own felicitous simile of the experiences of a flying goose.

The lecturer began by deprecating a severe rebuke administered to him on a former occasion by a learned writer for saying nothing about pictures and statuary, which it was assumed must be interesting to any person of education and taste. We must confess to a sense of bewildered curiosity as to who the learned writer can possibly have been who was anxious to hear Mr. Spurgeon's criticisms on the Italian picture galleries; and we cannot help thinking that the lecturer showed more wisdom than his critic, if less than his accustomed measure of Christian humility, in refusing to gratify so inexplicable a wish. Our opinion of his discretion would have been higher still if he had persevered in that refusal, without troubling himself to explain the reasons, the sufficiency of which would have been taken for granted by all who knew anything about him. However, he has explained them, and in a manner which fully justifies the closing comment of the *Daily News* reporter, that "his lecture was marked with all his old eloquence, humour, and force of application." More than all, we should have been disposed to say. It was possible, Mr. Spurgeon thought, to see too much of these things, and in fact he took very little interest in them himself. "After walking down more than twenty miles of picture galleries, one did not want to walk down twenty miles more; and after one had seen the portrait of a man twenty thousand times, it began to get rather stale." We have vainly racked our brains and our memory of the picture galleries of Europe to discover whose portrait Mr. Spurgeon can have seen twenty thousand, or even two thousand times, unless indeed his reference is one which, being on less familiar terms with sacred personages than himself, we had rather not specify. That he was "heartily sick of seeing just the same thing over and over again" we can quite conceive. Mr. Spurgeon's artistic eye is probably about as correct as the musical ear of the man who mistook "God save the Queen" for the "Dead March in Saul," and the twenty miles' promenade of Italian and Belgian picture galleries must have been a very vain repetition indeed to him. However, it supplied him abundant scope for that humour and force of application which so enchanted the reporter of the *Daily News*. Last year the lecturer was extremely forcible in his comments on "the Virgin's milk," and he has varied the application this year by some equally appropriate criticisms on "the Holy Families and Virgins" that he saw in different picture galleries. Unfortunately they did not enable him "to form any conception of what the "Virgin Mary was like," but, on the contrary, rather confused him. "He had seen her as a Frenchwoman, a Dutchwoman, a German, a Spaniard, an Italianwoman, and, last of all, he had seen her as black as soot"—an announcement received with loud laughter by his audience at the Tabernacle. And then follow some highly refined and appreciative criticisms on the flaying of St. Bartholomew, and Susannah and the Elders, and then a long comment on the martyrdom of "St. Sebastian, stuck full of arrows like a pincushion turned into a porcupine"; the weary iteration of whose portraits—we may presume in the churches at Venice—does not seem to have inspired Mr. Spurgeon with any admiration for Tintoretto, but only with a very strong feeling of dislike to the Saint, who, he evidently thinks, like Charles II., took much too long in dying. Indeed from his way of referring to Butler's *Lives of the Saints* he does not seem ever to have heard of St. Sebastian before, and evidently still considers him a very apocryphal personage. His general conclusion is, that there is not only a great monotony, but an utter want of talent, among the old masters. The two pictures which really did impress him, on which we might gaze and yet find them inexhaustible," were Paul Potter's Bull at the Hague, and "an excellent picture of a red cabbage," where and by whom is not stated. "So much for the pictures; nobody could now say he had neglected them." We hope the learned writer who wished for his opinion is satisfied with the flood of fresh light thrown on the subject.

After having disposed of the brigands whom he did not meet, and of the pictures of which he met with a good many more than he wanted, Mr. Spurgeon proceeds to make a series of discursive reflections, equally humorous and edifying, on various incidents of his journey. Thus, for instance, at the Brussels station he saw a carpet laid for the Queen of Belgium, who was going to travel by the same train with him, and he was quite ready to join in a hurrah for her; but, to his great surprise, there was no hurrah; whereupon he improves the occasion by observing that, as Belgians who are silent are as loyal as Englishmen who shout, so Quakers are not less devout than Methodists—including Baptists, we presume—but "the reverend gentleman feared he would not make a good Quaker himself, as he was rather too noisy for that." He travelled by night between Vienna and Munich, "and therefore had no opportunity of seeing the *Bremen* Pass," whatever that may be; but at Munich he was much interested—not of course with the frescoes and picture galleries, but with a moveable pulpit at the Basilica, which he thought "would be a capital thing for a Church of England edifice, as it might be placed in one position for the Ritualists, in another for the Evangelicals, and in another for the Broad Churchmen," so as to symbolize "the different sects and doctrines that flourished in the Establishment." The other object of interest at Munich was the statue of Bavaria over the *Ruhmes Halle*, of which he ascended the interior with a candle, but failed to gain "any distinct notion of the statue from inside." Most visitors to Munich will probably be more than satisfied with the very distinct notion to be gained from outside. But the lecturer draws the profound inference that theologians who go very deep into the heart of a subject are not likely to understand it nearly so well as those who contemplate it from a distance. It is no doubt by this judicious process of distant study that he has acquired his own knowledge of "certain theological antiquities, the Fathers," of whom he was forcibly reminded at Venice by seeing "some antiquities which had received their last coat of varnish the day before." And his study of modern languages is evidently conducted in the same admirable and expeditious method. "The German language might be, as some maintained [who had been foolish enough to go deep into the heart of the subject], very sweet; but to him who [having more wisely studied it at a distance] knew nothing about it, it seemed in the dead of night to consist of Yaw, yaw, and Hoch, hoch." Nor was German religion much better than the German language. "At Bautzen [Botzen?] on Sunday he saw two old women worshipping idols on the hills"—*i.e.* kneeling before a crucifix; "while the manliness"—Mr. Spurgeon is using the abstract for the concrete by a well-known classical figure of speech—"was practising with its rifle below." We found just now that Mr. Spurgeon had no very keen eye for Tintoretto's pictures, and was inclined to be altogether sceptical about St. Sebastian. It is only fair to say that he saw something else at Venice for which persons who do not study history on the principle on which he studies theology and language would look in vain; and that is "the particular spot in front of St. Mark's where the Pope of old put his foot on the neck of Barbarossa"—

a story which less accomplished schoolboys than Lord Macaulay's youthful prodigy know to be as purely fabulous as Mr. Spurgeon considers the history of St. Sebastian. However, it supplied him with a neat little Scriptural contrast between "Our Saviour and the present Pope," which we had rather not quote at length, though it provoked the hearty laughter of his audience. We pass over some rather rambling remarks on the decay of Popery at Rome and its revival in England, to come to the *chef-d'œuvre* of Mr. Spurgeon's lecture. It should be observed that its professed subject was "his recent tour in Italy and a visit to Pompeii." On the latter subject, however, he said that his memory altogether failed him, and he therefore craved permission to read a letter he had sent home at the time to Mrs. Spurgeon. All he could now remember was that the sight of Herculaneum and Pompeii reminded him irresistibly of the judgment which overtook Sodom and Gomorrah, the site of those cities "having been at one time a place of pleasure and sin." We could perhaps mention some other places of which the same might be said, but which have not been buried under ashes or lava. But it may be doubted if the Surrey Tabernacle can be considered exactly "a place of pleasure" by "any person of ordinary education and taste" while the bird who had flown to Italy is spreading his wings over the pulpit. Mr. Spurgeon's lucubrations on Christian art are undoubtedly striking, but, to repeat his own words, "it is possible to have too much of these things."

THE GUILD OF LITERATURE.

SOME correspondence in the newspapers has brought to recollection the Guild of Literature and Art, which, it seems, still survives. Many people will remember the name, but there was a general impression that the institution had long ago ceased to exist. It has a curious history, which may be briefly told. The Guild was established in that year of wonders and of all sorts of regeneration, 1851. Its object was to assist struggling or impoverished men of letters and artists, and to found an institution where "honourable rest from arduous labour shall still be associated with the discharge of congenial duties." Mr. Charles Dickens, Lord Lytton (then Sir Edward), and some others took the lead in this movement. Lord Lytton presented the brotherhood with a piece of land near Knebworth, and with a comedy in five acts. The land was to be used as a site for the new institution, and the play was to be acted in order to provide funds to build it. In accordance with this scheme Mr. Dickens led a band of amateur actors through the country, and a considerable sum of money was thus collected. But somehow there was a difficulty about getting the project into a practical shape. Here was the land and the money, but for a long time there was no institution. It was not till as late as 1865 that three houses were built at Stevenage on the ground presented by Lord Lytton. And after this there was again a hitch. Having got thus far, the Guild began to suffer from an odd kind of decay—a decay not of funds, but of objects on whom to expend the funds. The houses were intended for poor men of letters, actors, or artists, but none could be found who were willing to avail themselves of this snug retreat. Most Committees who have anything to bestow are embarrassed by the number of candidates pressing round them. But with the Committee of the Guild of Literature those familiar conditions were reversed, and they had to set to work to seek out persons who could be coaxed, argued, or bullied into accepting their favours. All their efforts, however, to find tenants for their houses, rent free, with a pension, and gas and water laid on, proved unavailing. Once or twice they had a nibble, but the fish always managed to get clear off. It would seem that the houses have remained untenanted during nearly the whole time they have been standing. The Guild continues to exist in the shape of a Committee, the members of which meet at intervals to condole with each other on the impossibility of discovering any necessitous authors or artists, and to see that their funds are safe in the bank. A proposal was made a year or two since to wind up the whole affair, and hand over the money to some other body, but nothing came of it.

It would, perhaps, be rash to conclude that the race of decayed authors and artists is absolutely extinct. When we look into the conditions of life in the Stevenage houses, we can have little difficulty in understanding the unpopularity of the establishment. It is a fault with many kindly, well meaning people that they do not care to make others happy except in accordance with some pet theory of their own. And this was one of the defects of the Guild of Literature and Art. It was a novelist's dream of a happy brotherhood of authors and artists. The poet and the painter, the novelist and the historian, the dramatist and the actor who had given life to his creations on the stage, were all to be gathered together, to spend their declining years, under the patronage of the more prosperous members of their various professions. "Honourable rest from arduous labour" was to be associated with the discharge of congenial duties. The brethren would have constant opportunities for genial intercourse. Occasionally some of the great men from town would drop in with their budget of gossip, kind remembrances from absent friends and flattering words for the old fellows on the shelf. The poet would quaver one of his ditties, the actor would give a recitation, the novelist would tell some good stories, and the artists would have some sketches to show. There would be a quick interchange of thought and wit, and so the days would pass in cheerful and dignified leisure, with just a touch of "congenial duties" now and then to disguise the charity. It was a very pretty notion, and one can almost fancy the sort of story which Bulwer or Dickens might have made of it. It was fitter, indeed, for a romance than for reality. The novelist in making up his book can move his puppets as he pleases. Living puppets are more troublesome, and so the promoters of the Guild discovered. The characters would not get into the pretty framework, or, if popped in for a minute, were out again directly. The truth is, the whole idea was an absurd anachronism. Nothing could be more fantastic or impracticable than a monastic settlement of poor authors and artists from London, planted among the meadows of Hertfordshire. The poor fellows to whom it was proposed to take up their quarters at Stevenage looked at the matter from a hard realistic point of view. It was several miles from a railway station, there was no late train from town, and railway travelling was expensive. They could not run up to town for dinner or the play and back again the same night. Lord Lytton and Mr. Dickens may possibly have persuaded themselves that, if it had been their fate, they could have passed their old age pleasantly enough in the Homes of the Guild, smoking their pipes together in the arbour, and clinking their glasses by the fireside. Successful men often have such fancies, and are scarcely able to make allowance for the void which is left in forlorn, broken-down existences. We cannot help thinking that it was just as well that the Homes should have stood tenantless and deserted. If they had been filled, just fancy what a colony it would have been! The members would all be men who had more or less failed in life. It would be only natural that they should owe the world a grudge for their misfortunes, and their chronic irritation would scarcely be soothed by finding themselves cut off from all their friends and acquaintances, and packed together and ticketed as a bundle of failures. The "poor authors" might possibly have become a kind of show in a dull neighbourhood, where there is little else to be seen; Knebworth on the one hand, and the almshouses on the other. If the money had been distributed in annuities, free from the tie of local residence, the poor old fellows could have lived with their friends and kept up some kind of quiet communion with the world of which they had ceased to be active members, and nobody need have been any the wiser. They would not have been made conspicuous by any badge or label, and would not have had the recollection of their misfortunes thrust upon them at every turn. It is obvious that if charity is to be given to artists and men of letters, it should be given in a delicate, simple, unostentatious form.

It may be supposed that, if the conditions on which the pensions of the Guild were offered had been less irksome and repulsive, there would have been a sufficient number of candidates for them. There must surely be some decayed literary men still left in the world, just as there are decayed lawyers and decayed greengrocers; but it may be taken as a proof of the general prosperity of literature that even its least successful professors should be too independent to accept assistance except on their own terms. It may be doubted whether there ever was any particular necessity for the Guild of Literature. One of its objects was to encourage provident habits and life assurance. But a provident literary man can do a great deal better for himself by insuring his life in some good office than by subscribing to a small class society; and it usually happens that those who require help are just those who have never subscribed at all. One of the difficulties of providing special help for destitute literary men is the difficulty of knowing what constitutes a literary man. The number of professional writers who write books or articles and who do nothing else is comparatively small. A great deal of writing is done by barristers, clergymen, soldiers, who have quite as much right to be reckoned literary men as the professional writers. The idea that men of letters and artists are less bound than other men to be steadily industrious and provident, and that, if they fall into distress, it is the business of other classes, as a matter of duty, to come to their relief, is happily disappearing. A claim of this kind cannot be substantiated, and to yield to it does infinitely more harm than good. A capable man may by hard work make a decent living in literature, as in other occupations, and a few grow rich. But it is well that literary labourers should understand that, as far as worldly rewards are concerned, the value of their work is just what it will fetch in the market, and that they have no right to expect to be maintained on any other terms. There is a remark, however, which one often hears, and as to the truth of which we are by no means clear. It is said that it is a happy thing for literature that it has been relieved from its obligations to private patrons. Unquestionably it is a good thing that poets and historians should be able to get a living without having to cringe to and toady rich boobies, but it is just possible that there may be a servility to the public which is scarcely more honourable or wholesome than servility to a patron. It is absurd to say that a good book will always find a publisher willing to buy it and print it. An author must consider what will please the publishers, and the publishers have to consider the taste of the public, and the taste of the public is not invariably of the highest and purest kind. A writer may not be appreciated till he is dead, and that is awkward for the writer, and especially for his family, if he has one. It is quite possible to conceive various kinds of literary work of great importance, but of an unpopular kind, by which a man could certainly not support himself if he had to depend solely on the public. There is no reason why a wealthy man should not order a book—a treatise, a history, a poem, or what not—just as he commissions a picture from a painter or a

bust from a sculptor. If the patron expected the man of letters to attend him in society, to cut jokes for him, and flatter him, and add to his importance by his puffery and servility, the connexion would of course be degrading and pernicious to both; but as long as the transaction was a simple matter of business, it is difficult to see why there should be anything dishonourable in a writer selling his work to a patron any more than to a printer. At any rate it is the class of men who devote themselves to the least profitable branches of literature who have the strongest claim on Literary Funds and Guilds of Literature.

THE OLD MASTERS AT THE ROYAL ACADEMY.

III.

HAVING in two previous papers dealt with painters who belong to Southern Europe—that is, to the cognate peninsulas of Italy and of Spain—we now turn to certain art groups or schools which by race and by character of work pertain to Northern or to Western Europe. Indeed Holbein, who by the remarkable portraits here exhibited first demands our notice, approaches so near to our shores and comes home so closely to our sympathies as to be almost English. "The Two Ambassadors" (114), one of the noblest portrait pictures extant, was painted in England, and the sitters are English. Sir Thomas Wyatt, poet and diplomatist, in sumptuous apparel, looks from one side of the picture direct to the spectator; on the other stands in more sober garb some learned professor. The black cap of a doctor, and also the sun-dials, the celestial and terrestrial globes, and mathematical instruments ranged by the doctor's side, indicate his calling, just as the musical instruments may be taken to symbolize the Muses to whom Wyatt was devoted. The ambiguous creature in the foreground, which has confounded the critics, is apparently the bone of a large fish; a set of teeth can be made out. The hands are scarcely in the best style of the master; though finely drawn, and full of character, they are hard, and though unusually well coloured, they are wooden. The accessories strike the eye as wondrously realistic; yet the details show no touch of the brush—a method of handling which marks the old German school generally. It can scarcely be supposed that Holbein could find time to get through all this incredible amount of drudgery himself; and accordingly the picture shows the inequalities which are commonly incident to the division of labour. The panel has blackened and fallen into bad condition; the ten planks out of which this unusually large surface is constructed can be distinctly counted by the open cracks between them. This is the most important work by Holbein in England; the still more important composition known as "The Family of Sir Thomas More" being now pronounced a copy, the original of which has been lost. Also from Longford Castle, the seat of the Earl of Radnor, come two historic heads, the portrait of Erasmus (178), and of his friend Ægidius (175), a celebrated traveller of Antwerp. A doubt has been raised by Mr. Wornum whether these two portraits are by Holbein or Quintin Matsys, and as an indubitable picture by the latter artist, "The Misers" (188), hangs close by, no better opportunity is likely to occur of settling the controversy by direct appeal to internal evidence. On comparing these several works, it strikes us that the handling of the "Blacksmith of Antwerp" is heavier, broader, ruder, than the touch of Holbein. In contrast the heads of Erasmus and of his friend Ægidius, though not quite identical in style—for Holbein often differed from himself—are subtle in outline, delicate in modelling, refined, though keen, in intellectual outlook; indeed so perfect are they that they might serve as sample works of the painter at his best. Accordingly Dr. Waagen says that the portrait of Erasmus "is alone worth a pilgrimage to Longford Castle." In the year 1754 the picture was bought as genuine; the price given being one hundred and five guineas, while the companion portrait obtained ninety-one guineas. The smallness of these sums can have no bearing on the question of authorship, that point having been only recently mooted by Mr. Wornum, who may boast of having conferred on Holbein the singular service of robbing him of signal works which most authorities ascribe to him. Turning to the historic evidence, we incline to think that it tends, like the internal traits, to substantiate the claim not of the painter of Antwerp, but of the painter of Basle. The doubt could never have arisen had there not been two portraits of Erasmus to be found or accounted for. It is certain that the one was painted by Quintin Matsys, and sent to Sir Thomas More; it is equally certain that the other was painted by Holbein, who became himself the bearer of the gift to the same Chancellor. Sir Thomas More was thus the happy possessor of two portraits of his friend, and the question is which of the two now hangs in the Royal Academy. Herman Grimm, the well-known German critic, strenuously rebuts the assumption that Quintin Matsys is the author. He attempts to show that Mr. Wornum is wholly wrong in dates and in the reading of the inscription. In fact, the Erasmus portrait bears the signature "Johannes Holbein, 1523," which must suffice to decide the issue save on the supposition of forgery. Herr Grimm, however, is able to substantiate this signature by proof that in the year 1523 the portrait of Erasmus was actually painted in Basle by Holbein. Moreover the letter of thanks written by Sir Thomas More six years previously, on receipt of the Quintin Matsys picture, expressly states that Erasmus is depicted in the act of writing, which should at once settle the dispute, inasmuch as the picture from Longford Castle in no way answers to this description. The companion portrait of Ægidius, on a twin panel, has been long accounted a genuine work by Holbein, though the evidence, we admit, is not quite conclusive. The picture of Erasmus, all questions of authorship apart, is, we do not hesitate to say, the best of the many portraits with which we are acquainted at home and abroad. No face is better known; the scholarly head, the shrewd and searching eye, the sharply chiselled nose and chin, the firmly set mouth, and the quiet mien of this bookish reformer are familiar as household words wherever the Reformation has taken root.

"The Misers," or "The Money Changers," is a motive on which Quintin Matsys played several variations. The idea of the picture now exhibited by Lord Lyttelton is repeated in identical or analogous compositions at Windsor Castle, in the Munich Gallery, and in the Louvre. The Windsor Castle picture has cast its *confrères* rather unfairly into the shade, and yet of this work as well as of its replicas Dr. Waagen writes as follows:—"I am not disposed to consider this example, or others I know of the same composition, as the originals, but rather as repetitions, and chiefly by Quintin's son Jan." Perhaps it might be going a little too far to assert that the work in Burlington House is the original, yet we have heard the opinion expressed that the composition at Windsor is its inferior. Certainly in quality and mastery, in character and realism, the Lyttelton picture is of the painter's very best. No subject is more familiar to the public eye, and assuredly when once seen it can never be forgotten. The picture has the advantage of possessing a telling story which those who run can read; the title is borne out to the letter by the canny couple of usurers who greedily count over their heaps of gold and silver coin. The scene is true to the very life, and the literal and illusive mode of setting down the minutest circumstance adds to the reality. As a study of character there is nothing more graphic in the whole realm of art; Hogarth has never delineated nor Dickens described incidents more true to actual life. In the wrinkles of the faces may be read not only shrewdness but chicanery, not so much the caution and the calculation of the honest trader as the stealth and stratagem of the usurer. And yet the characters are not overdrawn as in the case of a favourite and oft-repeated subject, "The Dishonest Gamester" of Caravaggio. Quintin Matsys lies on the frontier line which divides sacred and secular art; his grandest work is the "Descent from the Cross" in the Antwerp Museum, and no less great in its way is this "Misers." The first quarter of the sixteenth century, to which this work probably belongs, is an early date for a profane subject. The period of Madonnas and Holy Families had not passed away. Teniers and his crew did not come till a century later. Next to the "Misers" happens to hang "The Ale-house Door" (187), by De Hooge, a work which, though little short of perfect in technique, serves to point to the absolute secularization of art in the second half of the seventeenth century. As some compensation for poverty or baseness of idea the Dutch school offers realism, naturalism, and individualism, as in a little gem by Gerard Dow, "A Geographer at his Studies" (76).

Albert Dürer and Jan Van Eyck suffer cruel injury by the panels which are made to pass under their several names. "The Holy Women at the Sepulchre" (171) can at most be but of the school of Van Eyck; the handling is alone sufficient to show the rude mechanic; that such a botch can pass muster for a masterwork says little for the authorities that rule in Burlington House. We have already denounced as spurious "A Triptych" (160), falsely ascribed to Albert Dürer; and scarcely more authentic is "The Procession to Calvary" (173). A similar, if not an identical, composition in Dresden is entered in the catalogue of the Gallery as "Die Kreuztragung Christi. Grau in Grau gemalt." But the Royal Academy apparently thinks to silence all suspicion by printing the words "Painted 1527—with inscription, and the artist's monogram." As if a copyist would not copy inscription and monogram as a matter of course, with special care. We appeal to any artist or any man of well-trained eye to say whether Durer could possibly have been guilty of these bungling touches. "A Portrait Unknown" (189) seems to be ascribed to Dürer on sounder data. We admit that a more repulsive head was never put on canvas, but that is rather the fault of the sitter than of the painter. Yet we have not been able to identify the work. Neither would it be easy to prove by documentary evidence that the portraits of "Luther and Melanchthon" (170), or of "The Electors of Saxony" (184), come directly from Lucas Cranach. These portraits are no doubt to be classed among the very numerous repetitions found in Nuremberg, Munich, &c. &c. In the Manchester Art Treasures there was a picture contributed by the Earl of Craven of "The Elector of Saxony and the Reformers." It is known that a multitude of portraits such as the four now exhibited were manufactured by mechanical journeymen, and that Cranach injured his good name by allowing his monogram to be affixed. More than doubtful also is "The Descent from the Cross" (159), here put down, like many other pictures, at a mere venture. Van der Goes, as a scholar of Jan Van Eyck, could not have been guilty of this handicraft. From what we have said it will be inferred that what Dr. Waagen terms "the Teutonic style" is badly shown at Burlington House.

Yet Rembrandt is strong; indeed "The Lady opening the Casement" (81), lent by the Queen, has for quality and fine elaboration few equals at home or abroad. The nearest approach to it we can recall is the portrait of the painter's first wife Saskia

in the Cassel Gallery. In works of this character, which would appear to belong to the artist's middle manner, it is instructive to study the consummate execution. Rembrandt's first style was comparatively thin, dry, and hard; his latest products, in contrast, are over-laden with pigments, and the surface and texture become somewhat botchy and rotten. The figure now exhibited just strikes the happy mean. The colours are glowing, liquid, and translucent; the face is painted solidly; the flesh tones are enhanced by warm and transparent glazings. The colour is so pitched that white would stand out as a crudity; consequently the white of the linen underdress is made almost golden, after the common practice of the Venetians. Lastly, we may note the dodgy way of painting details, such as a fan, a brooch, and earrings. The pigments are here loaded in positive relief; and this solidity is set in opposition to transparent tones and glittering high lights. But the imitation is above servility; the execution even of the smallest circumstance is broad and generalized. In its way there is scarcely a finer piece of painting in the world. Young artists will do well to analyse the different manipulations now to be seen in Burlington House. They might pass with advantage from this largely treated head by Rembrandt to the miniature "Geographer" (76), by Dow; then to the naturalistic "Woman making an Omelette" (92), by Velasquez; thence to the severe "Ambassadors" (114), by Holbein; afterwards to the stately "Cornaro Family" (146), by Titian; and, lastly, they might end with the highly wrought "Agony in the Garden" (176), by Raffaelle. Thus within the short range of three rooms is found an answer to the question, how representative masters and leading schools set down their facts and gave expression to their thoughts; how they arranged their palettes and handled their brushes; how execution was with them never an accident, but always the outward sign of an underlying law; how each touch was, in a manner, part of the artist himself. Handwriting, deportment, voice, are not more certain indices of character than the touch of one of these old masters on panel or canvas; though dead, they yet speak. We have dwelt on these somewhat obvious ideas because one chief use of a collective exhibition of miscellaneous master-works is to enable the student to take a comparative view of the wide field of art, to make a demonstration, as it were, in the comparative anatomy of art developments, and to determine the landmarks which divide historic schools. The present exhibition by its diversity and its even balance seems eminently well fitted to attain these ends.

The Italianized French school is represented by its chief masters, Nicolas Poussin and Claude Lorrain. "The Worship of the Golden Calf" (105), and "The Passage of the Red Sea" (155), both from the Earl of Radnor's collection, are said by Dr. Waagen to have few equals anywhere, even in the Louvre. These impetuous and somewhat lawless compositions may recall the singular terms used by the Italian poet Marino in introducing Poussin to Cardinal Barberini—"Vedercte un giovane che a la furia del diavolo." The pictures, as usual, suffer from the aggravation of the reds in a darkly primed canvas. The judgment of Reynolds on Poussin may be justly applied to these most characteristic works; there is "great bustle and tumult," "there is no principal figure, no principal light, no groups; everything is dispersed, and in such a state of confusion that the eye finds no repose anywhere." And yet these compositions prove the learned Poussin, who deliberately formed his style on the antique, to be studious in drawing and in character, and highly dramatic in action. We hope in a future year to see the painter's master-work, "The Plague of Athens." Also from Lord Radnor's gallery come two exquisite examples of Claude, the Rise and Decline of the Roman Empire (144-147), which have been respectively engraved by Mason and Woollet. The same title is given to two landscapes in the Grosvenor Gallery. The pictures before us are as enchanted visions; in the one the sun rises on the Bay of Naples; in the other the evening closes over Roman ruins, including the Arch of Titus and the Colosseum. These allegorical compositions may have set Turner's imagination to work in the direction of "Modern Italy" and "Ancient Italy." With the ideal treatment of Claude may be contrasted the literal transcripts of Vandevelde, the greatest marine painter of the Dutch school. "Vessels in a Calm" (79) is a fine study of greys in the sails, the sky, and the sea. We must not forget another masterly work which asserts its rare merit, though the panel is rent from side to side; "Dort; River Scene, with Shipping and Boats" (206), is by Jan Dubbels, an artist who is sometimes mistaken for Vandevelde and Backhuysen. It is said that there are but two examples of Dubbels in England—one in the collection of the Duke of Bedford, the other the luminous liquid and literal coast scene here contributed by the Duke of Northumberland.

Vandyck is represented by no fewer than eighteen portraits; he is only exceeded by Reynolds, who reaches a total of twenty-three works. The courtly manner of Vandyck is almost too familiar to need comment. One portrait, however, that of "The First Countess of Southampton" (111), lent by the Dowager Countess Cowper, calls for special mention as a supreme but meretricious effort. The lady is placed in mid air, borne up among clouds, and above her head descends a shower of golden glory; a globe is under her arm, and a skull lies at her feet. The drapery, though rather flaunting, is magnificent in the cast of its folds and in the lustre of its colour. Vandyck has here put forth all his power.

REVIEWS.

ZELLER'S HISTORY OF GERMANY.*

ONE may doubt whether any natural Frenchman is likely to be just now in a fit state of mind to write a history of Germany. And if a natural Frenchman is not likely to be in a fit frame of mind, an artificial Frenchman is still less likely to be so. If M. Zeller is not a German, we shall begin to doubt whether Mr. Smith is an Englishman. The name might have stood and looked quite in its place in the title-page of a History of Germany as truly German as anything written by Luden or Waitz. But M. Zeller is described in his own title-page as "Professeur d'histoire à l'école normale supérieure et à l'école polytechnique, ancien tuteur de Strasbourg." Here then is the key; it is the old story of the "Hibernis ipsis Hiberniores." M. Zeller, just because he is a French-minded German, is fiercer against his brother Germans than if he were a real Frenchman. Now of course we do not deny for a moment that an Alsatian who feels as a Frenchman has a fair case. He may argue somewhat in this way:—"I am German by descent, German by language; but the political associations of several generations have made me French in feeling; I look on Frenchmen as my countrymen; I look on German conquerors as I should on any other conquerors." All this is natural enough; from a certain point of view it is reasonable enough; and we can even go on to allow that it is only human nature that people in such a case, if they dislike an annexation at all, should more bitterly dislike it than those who stand towards the conquerors in the common relation of foreign enemies. But it is rather ridiculous when people in such a case try to blink the fact of their own German origin, and to represent all Germans from the beginning of things as being, simply as Germans, not only enemies, but monsters. Here is M. Zeller, a man evidently of German descent, whose forefathers, two hundred years ago, perhaps eighty years ago, could have been French only against their wills. A man who has a right to share in all German history up to some point of the seventeenth or eighteenth century feels aggrieved with the course which the last events have taken between Germany and France, and he therefore sits down to appease himself by writing a gigantic libel against Germans in general, from Ariovistus to Bismarck. And what makes it worse is that M. Zeller is not a mere illiterate babbler in some Parisian newspaper, but a scholar who has read his books; who, when his passions do not lead him astray, understands his books; and who can write very much to the purpose whenever his subject does not afford some irresistible temptation to abuse of Germans and Germany. To say that M. Zeller writes his German History from a wholly false point of view would be to use language far too mild for the fact. He writes of the earliest times of German history with all the fanatical partisanship of a man whom the last German victories have caused to be no longer "recteur," but "ancien recteur de Strasbourg." To him the Germans of Cæsar and Tacitus are barbarians delighting in blood and carrying havoc before them; and the Germans of all the ages since have been pretty much the same—men whose sole business has been to invade Roman and Gaulish lands, and, as far as in them lay, to root up their civilization. A man who writes from this point of view, and who stops almost in every page to revile the barbarism of Germans, old and new, is not likely to write early German history in a fair or trustworthy fashion.

But when we say that M. Zeller's way of writing is untrustworthy, we mean that it is his way of looking at things which makes his whole story unfair. We do not find that his actual narrative of facts is in the strict sense inaccurate, though it is so coloured by passion as to be something worse than inaccurate. M. Zeller, in short, is not a shallow blunderer, but a scholar blinded by political fury. The volume which he now gives us goes from the beginning of things down to Charles the Great, and his treatment of the last part of his period is perhaps the most curious thing in the book. M. Zeller rises high above all the mistakes and confusions of mere ignorance or of mere French vanity. He knows perfectly well that Charles—Karl as he constantly calls him—did not speak French, and did not reign at Paris. He knows perfectly well that the dominion of the Franks was not the dominion of modern Frenchmen. Nor does he at all go in for that other line of treating the subject which has been common among a certain class of French writers. We mean the doctrine according to which the Celtic people of Gaul were, down at least to the great Revolution, held in bondage by a Frankish—that is, a German—nobility. There is no trace of either of these two kinds of talk in M. Zeller's book. His view seems rather to be that, as much may be made of a Scotchman if he be taught young, so much may be made of a German if he comes to live in Gaul. Two sets of German savages, the first Merwings and the later Austrasian Karlings, with their several followings, pressed within the bounds of Roman or Gaulish civilization. They came only to destroy but Roman and Gaulish civilization was too much for them, and it changed the original destroyer into a useful weapon against the still unconverted German of the East. Now it is manifest that in all this there is a certain element of truth; the political, social, and religious state of modern Europe is the result of the coming together of Roman and Teutonic elements, and of that coming

* *Histoire d'Allemagne. Origines de l'Allemagne et de l'Empire germanique.* Par Jules Zeller. Paris: Didier et Cie. 1872.

together the Frankish Augustus is the highest symbol. It is to be noticed that in this part of his work M. Zeller gets far more quiet, far less abusive, than he is in the earlier parts. He of course writes everything from his own way of looking at it; he catches at everything which can connect Pippin and Charles with the Western rather than the Eastern part of their dominions; but the perversion is a perversion of colouring, not of mere narrative. He even avoids the fashion into which hasty and ignorant writers so commonly fall of talking about France and Frenchmen before the time. In the days of Charles himself it is still *La France future*. The Frank is in his eyes a German made useful for Gaulish purposes, a view not so much false as one-sided. M. Zeller, even when carried away by the most frantic bursts of modern political passion, still knows his history too well wholly to forget the obvious facts of the case.

The great sin of the Germans in all ages has, according to M. Zeller, been that they have been barbarians, savages, everything of that kind. They were so in the time of Ariovistus, and, in M. Zeller's eyes, they do not seem to be much better in the time of Bismarck. In both ages they are contrasted with the higher civilization of Gaul, which, in both ages alike, it was their chief object to overthrow. Now, if the Germans are barbarians or savages in the time of Bismarck, they are very much to be blamed; but we cannot see that it is at all to their shame if they were barbarians or savages in the time of Ariovistus. Of course a good deal turns on what we mean by barbarians or savages. Mr. Tylor uses each word as a technical term with a fixed meaning; he would on no account call a barbarian a savage, or call a savage a barbarian. More commonly the words are used in a vague way to express something disagreeable, something that we think not so good as we are ourselves, all the more if the savages or barbarians anyhow happen to conquer us. This last is of course M. Zeller's way of using the word, a way on which it is hardly worth while to say more than that it is a game at which two can play, and that no two words in any two languages more closely translate one another than *βάρβαρος* and *Wälsch*. We have heard something of this sort before, when M. Guizot long ago made his famous comparison between the ancient Germans and the Red Indians—a comparison which M. Zeller quotes with great glee. The fallacy was plain at first sight; the comparison was utterly unfair even upon the mere facts, and historically it was utterly worthless. Supposing the Germans at a given time, and the Red Indians at a given time, were actually on a level, still the accidental likeness would be good for nothing, inasmuch as the Germans have—we must venture so to think with all deference to M. Zeller—shown some power of rising above that level, while that level would seem to be the highest which the Red Indians were capable of reaching, even if they had not actually gone down from a lower level. The most patriotic German may fully admit that a German of the days of Ariovistus was, in all points of material civilization, very far behind a contemporary Roman, very far behind a Romanized Gaul, somewhat behind even a Gaul who was not Romanized. But this does not prove any incurable barbarism on the part of the German; it is simply the natural result of the causes, whatever they were, which gave the Roman and the Gaul the start of the German in their geographical position, and in their consequent appearance on the field of history. What the German was then, the Gaul had been some centuries before; it may even be that at some time before recorded history the forefathers of the Roman were not much better. Italian, Gaul, German, were after all only successive swarms from one common hive, some of which were by favourable circumstances enabled to get the start of the others. The whole thing is a question of time. The Romans of the age of Camillus looked on the Gauls very much as the Gauls of the age of Cæsar looked on the Germans. The Gaul in one case and the German in the other was a terrible barbarian of whom his more civilized neighbour stood in not a little dread. The German, according to M. Zeller, is an unquiet being who cannot be kept in his own country, but is always going about to conquer or to ravage the country of somebody else. We do not deny that there is truth in this; only, so far as it is true of the Germans, it seems to us to be equally true of the rest of mankind. It would be hard indeed to find any nation which, if it has had the chance, has not done something in the way of invading and dispossessing other nations. As Englishmen settled in Britain, we feel that we have quite as much to answer for on this score as any Roman, Gaul, or German ever had. We can only comfort our consciences by thinking that it was a long time ago, and hoping that on the whole it has been for the best. But we have remarked that M. Zeller always speaks very respectfully of that part of the Teutonic race which did its conquering and ravaging beyond sea. He hints, to be sure, that we got tamed and civilized by intercourse with the Celts of our own island. We are obliged to M. Zeller for not calling us names; only we think that there is no need for name-calling in the whole business. The Germans simply did what the Gauls had done some ages before them; if there was a *Völkerwanderung* of the Germans, there had been an earlier *Völkerwanderung* of the Gauls. It might perhaps be convenient to agree all round to say as little as possible about any troublesome Iberians or other non-Aryan people whom any of us found it for the general good of mankind to put out of the way. But anyhow we have the manifest fact that, in the fourth and third centuries before Christ, Gauls were going about in such respectable parts of the world as Italy, Greece, and Asia Minor very much in the same way in which the Germans were going about in the same countries in the fourth and fifth centuries after Christ. And we find further that the people of these countries at the earlier time thought of the Gauls very much as their successors at the later time thought, and as M. Zeller still thinks, of the Germans. The truth is, that all national invectives of this kind going up to very early times are altogether idle. We have all been barbarians—we say barbarians advisedly, for we should be inclined to cavil at any Aryan people being called savages—and there is no use in throwing stones at one another because any of us, when we were barbarians, acted like barbarians. The real question is, how any of us have behaved in times when we ought to have known better. It is no sort of blame to the Gaul now if one Brennus sacked Rome in the fourth, and another Brennus wanted to sack Delphi in the third, century before our era. The question is about the burning of Spoier and Worms in the seventeenth century after Christ, about the occupation of Rome and Lübeck and Saarbrücken in the nineteenth.

It should further be borne in mind that, getting the start, whether among nations or in anything else, sometimes cuts both ways. It is not wonderful that those who come to the front first should in their turn give way to others. It is simply a fact that the Southern races, which were once the very foremost in the world, have given way to others who have pressed upon them. Greece is very little positively; Italy is very little compared to what she once was. Now how about the Celts? The pure and proper Celts, both in the British Islands and on the mainland, have sunk into insignificance. The respectable part of them survive in the harmless character of antiquarian curiosities. Another branch of the race lives on as a standing political difficulty to its neighbours. But, on the other hand, we freely grant to M. Zeller that one of the foremost nations of Europe—for after all her present misfortunes, it is most unlikely that France should cease to be one of the foremost nations of Europe—is mainly Celtic in blood and mainly Celtic in character. To what then does it owe a greatness which has lasted so long, and which is likely to last longer? Clearly, because it has been strengthened by what it has borrowed from two successive sets of conquerors. France is mainly Celtic in blood and mainly Celtic in character. But her speech and literature are Latin, and we must add that her political being is Teutonic. France is Celtic as a nation; she is Teutonic as a kingdom. Unpleasant as the doctrine may be to M. Zeller, history can look on the kingdom of France only as a fragment which in the course of the ninth and tenth centuries parted off from the great German realm. No doubt the reason why it parted off, and why it was able to live on with a fresh and vigorous being, was that it represented the distinct Celtic nationality. Still, as a fact, it did so break off, and the fact that the political being of France was Teutonic has been as important in French history as the fact that its literary being was Roman. As the German poet sings:—

> Et simul a nostro secessit Gallia regno,
> Nos priscum regni morem servamus, at illa
> Jure suo gaudet nostra jam nescia legis.

Some remarks on M. Zeller's treatment of particular points of detail we must keep for another time. When he writes as a scholar, and not as a frantic partisan, he fully deserves such extended notice.

(*To be continued.*)

THE SPIRIT OF ST. FRANCIS DE SALES.*

ST. FRANCIS DE SALES is an intelligible Saint in contrast with many who—we have the best authority for saying it—are not intelligible. "Men like St. Alphonso Liguori," says Rome's most distinguished convert, "are on a level very different from our own, and we cannot understand them." We may assume the reader to be humble enough not to put himself on a level with St. Francis de Sales, yet, in the ordinary sense of the word, he understands him. There is nothing startling, nothing hyperbolical, either in the things St. Francis says or in his mode of saying them. He has no sympathy with extremes. He uses his own judgment, and appeals to that of his reader, who, contrasting him with other writers on similar topics, comes to regard him almost as an apostle of common sense; so much so as to be inclined to wonder at his title. We cannot indeed study the book before us and compare it with modern popular Roman Catholic theology without suspecting that, if the question of the canonization of the Bishop of Geneva had been postponed to this day, he would have remained plain Francis to the end of time. Not that he was not a most faithful, undoubting son of the Church into which he was born; his was not the questioning temperament. It is the part of ordinary common sense to make the best of things as it finds them. Linked with high moral qualities, this temper constitutes the wise man, who, accepting the outward framework of things, can regulate his own course, and direct others into safe paths, whatever tendencies or temptations external circumstances present. St. Francis neither was a great genius nor thought himself one, but he was endowed with a natural independence of character which he saw no reason to quench; he respected his own judgment, and saw things by its light. And it is this which makes his books—or books of which he is the subject—such easy reading. Our teacher and counsellor is no grave abstraction, judging our case by rule and line, subjecting all to the same measure; but a real man

* *The Spirit of St. Francis de Sales.* London: Rivington. 1872.

with the flavour of originality evident in his whole view of things. There is in him a clear enjoyment of the exercise of thought; he trusts himself, talks and writes as it were in good spirits; at times gently satirical, often playful, always unconstrained, and, to sum up, never bombastic, tedious, or prosy. In such points we may note a marked difference in the records of male and of female Saints. A strict devotional life does not quench wit in men as it does in women. The Saint repudiates less of his natural temperament than does his sister in sanctity; hence the memoirs of pious women are more ponderous, unrelieved reading than those of pious men. A weight of responsibility, of concern for others, and for her own soul's well-being, presses all intellectual play out of the consciously endowed with a mission. The nun's liveliness is uniformly depicted as a return to mere childishness. An unrelieved gravity is the common characteristic of all published memorials of feminine piety. All denominations have their saintly wit, or even wag; but, as far as we know, there are no feminine representatives of the class. St. Francis de Sales, as shown to us by the Bishop of Belley, was clearly as bright and lively a companion as many a sinner of witty reputation. He was a student of human nature on the highest grounds, but he used his knowledge for amusement as well as edification. Naturally we learn this from one of his male friends rather than from his female adorers. This friend is Jean-Pierre Camus, Bishop of Belley, author, we are told, of two hundred books—one only, however, still known to fame, the *Spirit of St. Francis de Sales*, which has fairly earned him the title of the ecclesiastical Boswell. The same gifts of tenacious memory, and enthusiastic admiration for pre-eminent endowments, moral and intellectual, qualified one as chronicler of the sage and the other of the Saint. And as no one can subjugate himself to the worship of a fellow-mortal without some damage to dignity and character, so the good Bishop of Belley is not without a touch of Boswellian weakness, or what in one instance may go by a worse name, except that the test he applied argues in him rather an absolute faith than an outrageously impertinent curiosity. It is while dwelling on the Saint's dislike of singularity in religious houses, calling it a "very pest," and on his advice to all good people to conform as far as possible to the manner of life usual among their equals, without any affectation, that he makes the following confession:—

> Certainly the Bishop practised what he preached, for during the fourteen years I was under his guidance, and studying all he did—his actions, even his slightest gestures and words—I never could detect the least appearance of affectation. I will confess one trick I played him. Every year he used to come and stay with me for a week, and I used then to watch him through holes bored in the panels on purpose, so as to see what he did when alone in his own room, whether in study, prayer, or meditation, writing, sitting still, or moving about, going to bed or getting up, and, in short, under all those circumstances when men are wont to feel most completely free from restraint. But I never saw him change his demeanour in the slightest degree; what he was among other men he was when alone, and the composure and evenness of his mind were reflected in his bodily movements. He was just as dignified when by himself as in the largest assembly, and when engaged in prayer you would have supposed that he was in the presence of all the saints and angels: he was always motionless as a pillar, and his countenance most full of reverence. I used to watch whether, when alone, he crossed his legs and leant upon his elbows, or the like; but no, he never varied in the gentle gravity of his external aspect, which inspired every one who saw him with love and reverence.

Unjustifiable as was the experiment, we may yet read the result with profit, and with the image of a noble character left more distinctly marked on our memory. It is in his relations with this ardent disciple, whose weaknesses were as transparent to him as he himself has made them to his readers, that the Saint's gaiety of character comes out. He snubs his devotee much as Johnson did Boswell, and with as little reserve. It came to his ears that the Bishop had taken to imitating his style of preaching, his action and pronunciation, and was exchanging a rapid delivery for a slow, sonorous one. "Apropos of sermons," he begins, "the last news is that you have taken a fancy to imitate the Bishop of Geneva." "Well, and after all he is not a bad example," is the reply. "Oh, if you come to that," Francis answered, "we will grant he is not amiss; but the worst of the matter is, that I am told you imitate him so badly that no one can tell what you are at, and that while you spoil the Bishop of Belley, you in no way succeed in copying the Bishop of Geneva." Going on, however, to regret his own slowness and difficulty in finding words—"I am always trying to drive myself on, but the more I try the slower I go. I toil and I sweat, and make no way." We may perhaps fairly attribute to this sense of effort some share of his objection to long sermons. One of his rules for preaching is brevity—"Believe me, I speak from long experience, the more you say the less people remember; and the less you say the more they will profit. When a discourse is too long, the end makes one forget the middle, and the middle puts out the beginning. Depend upon it, there is no more detestable quality a preacher can possess than tediousness."

St. Francis's sympathies, we are led to conclude, were with the secular rather than the technically called religious life. It was not his original intention in founding the Visitation to found a religious Order with vows; but the tendencies and spirit of his Church overcame his first design. As he himself said, "I am a pretty sort of man to be a founder and start a new Order: in fact, I have done what I wanted to undo, and undone what I meant to accomplish. All I intended was to establish a single house at Annecy for women, widowed or others, without enclosure or vows, whose work should be visiting the poor, destitute, &c.; and now we have a regular enclosed Order following the rule of St. Augustine, a thing altogether incompatible with my first scheme, according to which the Sisters lived for some years." When he was chosen to reform religious houses, he would not begin by adding new rigours to the rule, and he laid little stress on austerities and bodily mortifications (though he secretly used them himself), enjoining no fasts or similar acts of self-denial save those appointed by the Church, any more than dispensing with linen:—

> Francis was consulted once as to the propriety of going barefoot, as was proposed in a certain religious house. "For goodness sake," he exclaimed, "let them keep their shoes. It is their heads you must try to reform, not their feet."

His respect for others never went to the length of checking the expression of his own opinion; his reverence was never blind. His was a critical mind; he subjected everything to its judgment, and was jealous of conventional views. When bodily austerity was a popular test of holiness, he could liken the severe General of the Carthusians to a bad doctor filling the churchyards. In reading inscriptions in the cells of that Order, he had a qualification and a new reading ever ready. Thus, one having written "*This shall be my rest for ever: here will I dwell, for I have a delight therein*," his prompt comment was, "One must choose God as one's dwelling-place rather than a cell, if one would dwell therein for ever." "It is an unquestionable fact," he says, "that one ounce of humiliation and correction from another hand is more profitable than a hundredweight which is self-imposed"; and, dividing humility of the will into several degrees—loving it, wishing for it, and practising it, either by seeking occasions for humiliation or *accepting them willingly when they arise*—he prized chiefly this last; because there is more "abjection" in bearing what is unsought than in any we choose for ourselves, that which is self-chosen being always liable to the assaults of self-love.

It is forbidden by his Church to give the Bible to the laity as a manual; but his references to it are constant, and his illustrations much drawn from the Old Testament, which is fortunate, for his similes taken from nature are more curiously independent of fact or of the test of experiment than one often meets with. He strongly enforces the primary claim of the literal meaning of Scripture over all other modes of interpretation, allowing the mystical and moral to follow if not overstrained. He is, like all good men, emphatic on the awful reverence due to God's Word, and, like many good men, also permits himself a certain familiarity of application which might be open to criticism in hands guided by less judgment. Thus when "certain religious" complained to him of the ignorance and dulness of the Superior set over them, he first rebuked them for insubordination, and then reminded them that Balaam was instructed by his own ass—an illustration which would surely have missed its mark if it did not raise a smile.

We are not sure that the ladies, secular and religious—with the one exception of Madame de Chantal—who hung upon the counsels of St. Francis with so implicit a reverence, would have been altogether gratified by the tone held towards them in these intimate discourses. Celibates have naturally some relation to the tailless fox. The weaknesses and follies of the sex may well be a popular subject. "What do you mean to do," his friends asked, "with this congregation of women? Surely it would have been better to found an Order of men. The time you devote to teaching these women, who have to be told the same thing a hundred times over before they remember it, would be better spent in training ecclesiastics." The Father's defence is, that he leaves gold and silver to be handled by the jewellers; he confines himself, like the potter, to clay. Again, when women of the great world gather round him, his friend wonders at them; "for it seems to me you never say much to them." "Do you call it nothing," he answers, "to let them talk as much as they will to me? Most assuredly they care more for ears to listen than words to reply. They talk enough for us both, and probably they come to me because I am such a good listener; nothing is so delightful to great talkers as a patient hearer." When his servant consulted him on the question of marriage, the Saint advises caution, reminding him that "marriage is an order in which profession goes before the novitiate; if there were a year's probation we should see fewer professed."

He was a sayer of sayings; probably not all of them here recorded were designed by him for perpetuity; but all leave the impression of a peculiarly single-minded honesty. He "abhorred," for example, the whole system of equivocation, which he called "an attempt to canonize falsehood." In a similar spirit was his favourite saying that reason does not deceive us, but reasoning often does. He held himself cut off from all action in politics as knowing nothing of the arts of lying and dissimulation, "which are the mainsprings of diplomacy, and the most consummate points of worldly wisdom." He had no great respect for taciturnity as a virtue, though he granted that "nothing is so like a wise man as a fool who holds his tongue." He himself shone in society, was a teller of good stories, and evidently could not be in company without contributing his share to its entertainment. We are not sure that Joe Miller, who gathered flowers from every garden, has not perpetuated this of the Spanish pilgrim, who, being heavily charged at a certain inn, in his anger left the house for another inn exactly opposite, and noticing a crucifix between the two, vented his displeasure by exclaiming that as of old our Lord was placed between two thieves. The innkeeper with whom he had not lodged naturally inquired why he was to share so hard a condemnation; whereupon the ready wit of the pilgrim answered, "Hold your tongue, brother, you shall

be the good thief." The rule of patience which served him in his graver hours of intercourse, and taught him never to betray weariness or annoyance at the most ill-timed interruption—"While I am doing this I am not required to do anything else"—left him free to amuse or be amused in the hours of recreation.

It has been our aim to bring the Saint's character before the reader in its lighter aspect. Though he said of himself that his life was so happy that "sometimes I tremble lest God should have given me my share of Paradise in this life, for, in truth, I scarce know what adversity means," there is, we need not say, a reverse side of labour, self-denial, and bodily austerity. This peculiar happiness, we see, is due to the harmony of his whole nature; we detect no contradictory tendencies. As he says of devotion that it is a liquid which at once adapts itself to any shape, so, whatever might have been his calling, and, we will add, whether born in the Anglican or Roman communion, such qualities and graces would have found an exactly fitting and appropriate field.

DE CARNÉ'S LAOS.*

THE political troubles of France have delayed the publication of the formal labours of the Commission set on foot upwards of six years ago for the exploration of the valley of the Mekong or Cambodia River, with the view of reporting upon the geography of the little known interior of the Indo-Chinese peninsula and upon the prospects of trade with the Empire of China and the Eastern seaboard. The preparation of the report has of late, we are glad to hear, been taken actively in hand, under the direction of the Minister of Marine and the Colonies, by the surviving members of the exploring party. If the hope of making the Mekong the great maritime route of Indo-China, and Saigon one of the first naval and commercial ports of the world, has had to be given up, the great end of the expedition having thus been proved a failure, enough has been done by way of discovery in the field of geography and the material sciences to reward in great measure the enterprise of the French Government and the hardihood and skill of the adventurers. A series of papers in the *Revue des Deux Mondes* has at intervals during the last four years made the public acquainted with much of the main outlines and general results of this novel enterprise. They were from the pen of M. Louis de Carné, a promising young attaché to the Ministry of Foreign Affairs, who had been specially appointed as secretary to the expedition under the able Chief Commissioner, M. de Lagrée. These papers—often no more than a literal reproduction of a journal written under the pressure of hardship and peril, at times on the bench of a canoe, or by night in a tent set up in the depth of the forest—were put together in such leisure as the writer could spare from the preparation, jointly with Lieutenant Garnier, hydrographer to the Commission, of the more formal re[port] which we trust ere long to have an opportunity of introducing to our readers. Cut off within the last two years, at the age of twenty-seven, by the effects of fever contracted amid the [swamps] of the Mekong, intensified by sympathy with the di[sas]ters of his country, the able and earnest writer was not [spar]ed for the superintendence and revision of the volume which now lies before us, prefaced by a short memoir from the pen of his father. Such faults as those of imperfect arrangement, want of condensation, and inaccuracy or weakness of translation, too often to be met with, are not therefore to be laid to his charge.

What little has been known in Europe of Laos—forming as it does a political or tribal rather than a geographical expression, extending to that part of the Indo-Chinese peninsula comprised within the river system of the Mekong from the border line of the kingdom of Cambodia to the Chinese territory, between the Annamite Empire on the East and the kingdom of Burmah and the Tenasserim provinces on the West—dates from the visit of the Jesuit Marini, whose history of Laos was published in 1666. About the same time took place the embassy of the Dutch under Van Vusthort, with a view to making [arrange]ments with the King of [Laos], penetrating as far as the capital of the kingdom, called by them "Winkyan," but, under the veil of dubious spelling so common in rendering Oriental names, [kno]wn to geographers in general as "Lang-Chang." Langione was the [na]me given to the name by Marini, who interprets it to mean "the town of the thousand elephants." Vien-Chang is held by the French Commission to come nearest to the native pronunciation. Captain (now Major-General) W. C. MacLeod, who, of our own explorers, has had most to tell us of both province and people, has mixed up this place ("Lantchiang" in his Journal of January 1837) with Muang-Luang-Prabang, the capital, as the French Commission found, of the distinct kingdom of Upper Laos. It was at Luang-Prabang that the daring and gifted Henri Mouhot, the [re]cent explorer of the pestiferous banks of the Mekong, yielded up his life to an attack of fever in the hot season of 1858. The name of the King we fail to gather from M. de Carné's narrative; but the kingdom of Luang-Prabang is described by him as the first of the native States along the valley of the Mekong which is to be regarded as a simple tributary of Siam, not forming in strictness a province or integral portion of that ambitious monarchy. The quasi-independence of this kingdom of Upper Laos was reflected in the air of hauteur or stiffness with which its monarch received the official letters commendatory from Bangkok. Inferior in fertility, this province gains by contrast with the plains of Lower Laos in the degree of attention bestowed upon agriculture, particularly in the irrigation of the land by means of canals, and in the resulting crops of maize and rice. Far greater animation was found to prevail in the capital, and the people are described as being less stolid or rude to visitors. In the matter of currency, however, Northern Laos is much behind the lower province. At Stung-Treng, the first town after crossing the Cambodian frontier, our travellers received from the natives in exchange for the Siamese tikal so many little bars of iron, varying from seven to ten to a tikal. On leaving Bassac the bars of iron were exchanged for one of copper, lighter and more convenient. At Phon-Pissaï copper money entirely disappeared, the only medium of exchange current at Luang-Prabang being white cowry shells, strung together like the sapecks of Cochin-China, twenty-five being worth a tikal, or about three francs. The Mexican dollars brought by our party were with difficulty got rid of, and then only as objects of ornament to hang round the necks of children. Tribute is levied in these shells by tax-gatherers, from royal, municipal, and private property alike, to be sent to the King of Siam. Gifts had been sent by previous rulers to the Chinese Emperor as well, but the revolt of Yunnan had encouraged the present sovereign to drop the practice. Sovereign power is nominally limited by an assembly of chief functionaries forming the royal council or *Sêna*; but, nominated as these are by the King, they can exercise but a delusive check. The system of di-archy prevails in Laos. Below the first King sits, as at Bangkok, a second King, with a title, but no real power. He it was who, at the time of the French visit, had gone to be present at the funeral of the second King of Siam.

The analogy of manners, customs, and above all of language, seems to point to a common origin for the Laotians and the Siamese. M. de Carné inclines to the belief with certain savants that the Siamese came from Laos. Whatever may have been the earlier state of the country and its people, it seems to be made out that they no more than their neighbours of Tonkin, the Siamese or the Cambodians, escaped the invasion of China, when the union of that vast empire was effected. Drawing themselves together along the banks of the Mekong into a kind of Republican union, the Laotians about the fifth or sixth century of our era drove out the Chinese; the State thereupon becoming monarchical, and the foundation of Vien-Chang, destined to become the brilliant capital of the most powerful Laotian kingdom, dating, M. de Carné considers, from that time. A Siamese dynasty was somehow set upon the throne. After a thousand years of rule, chequered by war with Burmah as well as China, and even by temporary subjection to the former enemy, Laos at some uncertain date, probably as the result of the war of 1777, became finally tributary to Siam. An attempt at independence at the close of 1827 was crushed by an invading force from Bangkok, as ruthless, writes M de Carné, as that which took Jerusalem. The Laotians were exterminated or carried off *en masse*, and their capital razed to the ground. The King of Vien-Chang, who had sought refuge in Hué, given up by the sovereign of Annam, was tortured to death at the Siamese capital. It is too much to say, with M. de Carné, that an entire people has thus been annihilated without a single echo of their despair having been heard in Europe. Still the entire aspect of the lower province is that of decay and desolation, from which it is hardly likely to be raised under Siamese domination. Whatever of life and independence is manifest among the Cambodians is due, according to our author, to their having come at the nick of time under the protectorate of France. His introductory chapter traces at some length the diplomatic wiles by which the intrigues and threats of the Siamese Government were baffled or mastered by the skill or the firmness of M. de Lagrée and the officers of the French mission, ending in the checkmate of Phnen-rat, the envoy from Bangkok, and the conclusion of the treaty of 1868, which placed King Norodom in security under the ensign of France, the flag of Siam being finally lowered in Cambodia. It is amusing to see, here and throughout the book, with what jealousy and suspicion the policy of England in relation to Indo-China is regarded by the writer. Our interchange of friendship with Siam is set down as the play of the cat before its fatal spring upon the mouse. "From Moulmein she already watches Bangkok, and, not being able herself to take Cambodia, she was willing to enrich a friend of whom she expects to be heir. No wonder she was annoyed to find in her way rivals whom she thought she had for ever driven away from Asia." Meanwhile she plots to have the French cooped up by enemies within their new settlement. To set aside then the predominance of Siam, to recover, if possible, the autonomy of the Laotian provinces, and to establish direct relations with China to the North, and through Tonkin with the Eastern seaboard, opened up a vista for French diplomacy and enterprise to which M. de Lagrée and his coadjutors set themselves with ardour and hope. Unhappily for their aspirations in the main respect, the Mekong, "Mother of Waters," was soon found to be too much broken by cataracts and other barriers to navigation for the fulfilment of their hopes of seeing it a great highway for the exchange of French for native produce. It is towards the Gulf of Tonkin, separated as it is by only seventy leagues of fertile country from the town of Luang-Prabang, that the trade of the Indo-Chinese peninsula may be expected to pass. The chief result of the mission of M. Lagrée was to establish the fact of the

* *Travels in Indo-China and the Chinese Empire.* By Louis de Carné, Member of the Commission of Exploration of the Mekong; with a Notice of the Author by the Count de Carné. Translated from the French. London: Chapman & Hall. 1872.

fine river Sonkoï, taking its rise in the province of Yunnan, being navigable to the sea. Traversing Yunnan, which showed everywhere the traces of the Mussulman war of independence, which seems by the most recent advices to be terminating in the more complete subjugation of the province under Chinese absolutism, the party pushed their way until the death of their energetic leader at Tong-Tcheou put an end to further progress. With the corpse of M. Lagrée in charge, the survivors succeeded in reaching the Yang-tse-Kiang at Sou-Tcheou-foo in May 1868, and from thence descending the stream to Shang-hai, found their way back to Saigon. During their chief's illness the opportunity was seized by M. de Carné and others of the party to penetrate to the West as far as Lake Tali, the geography of which region had been a puzzle to map-makers. The detailed charts of M. Garnier will enable us to fix with precision the position in latitude and longitude of the most important points in the course of the Mekong. To pursue this mighty river upwards towards its unknown source in the snowy range of Thibet had entered into the visions of our explorers. But it was not by them that the mystery was to be solved which Marco Polo seems to have come near to penetrating, and from which Mr. Cooper lately turned back when apparently on the eve of clearing it up. We are in the dark as to the authority upon which the latest Government maps from Calcutta carry up the Mekong and the Irrawaddy in parallel lines to a common water parting in the high range of Thibet, near lat. 31 N. But from the break in the Likiang range, whence it rushes to receive lower down the overflow from the Tali lake, the valley of the Mekong may be considered to have been now approximately surveyed. Much of the new information thus acquired has already found its way into Mr. Trelawny Saunders's latest map of British Burmah and the Shan provinces adjoining, and has from thence been incorporated into the Calcutta maps aforesaid.

To M. de Carné's lively and picturesque narrative we are indebted for many details of the physical aspect of the country, the ethnology and manners of the people, and in particular of the monumental remains which exist of races and dynasties long passed away. The grand ruins of Angcor, of Basse, of Vat-Phou, and of Vien-Chan, tell wonders of the old Khmer (the native name for Cambodian) civilization. The pagoda of Phâ-Kéo, as it was its ruined walls pierced with thousands of little [illegible] regularly built, in each of which squats a miniature Boudsha. It was calculated that there could be no less than twenty thousand of these. It is a veritable pigeon-house of gods. The unhappy Laotian who did the honours exhausted himself in bows and prostrations, from horror of the guardian genii of the ruins. "A spirit lives there, Tepada," said he; "he lemmade every one who draws near him to creep, and will stand no trifling on this point." Occasional difficulties with the natives beset the travellers' path, but worst by far were the physical and animal pests of this terrible Laos. Insects pierced through and through their barrels till the wine and brandy ran out. At times they were all but devoured by leeches. Tigers and other beasts of prey swarmed and roared round their encampment. Such were the damps of the Mekong that hardly enough flour could be kept from absorption to make the quinine pills on which life literally depended. In Yunnan so potent were the fumes of the poppy fields as to cause vertigo in the heads of the party and of their beasts of burden. On the whole, however, there was novelty and grandeur enough from first to last to atone for all kinds of privations, as well as to make a highly pleasant and instructive tale out of our author's reminiscences of travel.

THE OFFICIAL AUSTRIAN HISTORY OF THE WAR OF 1859.*

THE work of the new Military History Section of the Vienna War Office seems to us to increase in value with its experience. The volume before us is superior in clearness and general arrangement to those on the War of 1866, whilst in honesty of purpose and thoroughness it is not behind them; and there can be no greater praise as regards the latter qualities. That the treatment of the subject is somewhat cold and dry seems to have struck the compiler himself; for, in the preface with which he commends his labours to the judgment of his comrades, he points out that these conditions are almost inseparable from an attempt to regard the national disasters in a purely abstract and impartial light. He pledges himself at the same time that the reader will find no concealment of the causes which led to defeat in what Austrians still regard as a just cause, it being his duty to lay them bare unsparingly. And the work bears out this promise fully—that is, as fully as any one can possibly hope who remembers that the writer is serving under, and is possibly in constant communication with, the same monarch who lost the crown of Lombardy in the great struggle the details of which are to be unfolded. In fact, with this reservation, it is difficult to believe that any foreigner enjoying the same facilities would have written the story of 1859 in a more thoroughly independent manner. As to his accuracy, those who take the trouble to compare the work with the gaudy volumes put forth on the same campaign by the Imperial Historiographer of France in the days of the Second Empire will find good cause to regret, with us, the mistaken taciturnity which the Austrian War-Office until very recently made its rule. Had its labours in this direction begun half a century since, we in England might have been spared the discredit of military histories which reflect too faithfully, for want of the means of correcting them, the vicious partialities of a bad French school. Austria has herself to blame if the world has been ready to believe that the career of the revolutionary French generals was one of unbroken success during the long struggle to win the Rhine frontier for their aggressive Republic. The glory which should justly attach to her soldiers for Neerwinden, the Waterloo of the revolutionary wars, and for the rout of Pichegru's army before Mayence, which left that fortress German until Napoleon long after dictated peace on his own terms, has been robbed from them by the policy of silence once dear to Hapsburg rulers. Were it not that in the Archduke Charles there arose one as able to write history as to act it, we might have had English authors still representing Moreau's retreat through the Black Forest as a significant triumph, and Napoleon's bloody check at Aspern as only an unfinished victory. Happily this mistaken reticence has melted away with other traditions of personal government. The desire at Vienna now would seem to be to make full amends for lost time. And it must be confessed that in honesty and fulness the new series of Austrian Official Histories could not be surpassed, had the chronicles of 1859 and 1866 unbroken successes instead of constant defeats to record.

The volume before us begins with a brief but very clear summary of the political events and negotiations that preceded the campaign of 1859. It then reviews successively the resources of the three Powers, Austria, France, and Sardinia, which were to become engaged. There follows a detailed account of the means taken by the same Powers to bring their armies into the field of action in Italy, in which the time which each took, and the effect of the gain or loss on the subsequent operations, are clearly pointed out. Over one hundred pages of close print are devoted to these sections, and a few more to the concentration of Gyulai's army in Lombardy before war was actually begun. The remaining five hundred of the massive volume carry the story of the war beyond the battle of Magenta, and the consequent retreat from the rich plain of Lombardy which the Hapsburgs there lost for ever. No truly patriotic Austrian can regret that his country is parted from a possession which for long had been a growing source of danger and weakness; but it is natural that her soldiers should desire to see the reputation of their army vindicated. For the old spirit of gallantry and *comaraderie* clings to the Austrian service, despite repeated misfortune and changed administration; and those who would affect to trace in this merely the traditions of the Thirty Years War and its barbarous hirelings may learn from the very dryness of these pages to sympathize with the loyalty which fought in 1859 for a hopeless cause, and with the honesty of purpose which frankly tells the tale of defeat.

To the general reader no part of the work is more important than that which deals with the preliminary negotiations. A study of this first section will convince the most incredulous that the Bohemian war of 1866, far from being a sudden thunderclap of hostile feeling, was but one act in a long-continued drama, in which Austria and Prussia played the parts of rivals, and the minor States and neighbours of Germany were more or less mixed up. The writer of the Official History starts with the New Year's reception of 1859 at the Tuileries, and the sudden declaration of Napoleon III., which showed that the French sword was about to be thrown into the balance on the side of struggling Italy. It would have been more to the purpose of the story, if less consistent with official caution, to have gone back to 1850, and have painted the check then inflicted on Prussia by the superior readiness and boldness of her rival in the affair of Hesse. Owing to her lack of organization, and of the audacity which characterized the action of Prince Schwartzenberg, Prussia, after threatening hostilities, was publicly forced to what was in truth an ignoble political capitulation. The defeat rankled sorely in the minds of her statesmen. And when Napoleon suddenly avowed his hostility to the Austrian influence in Italy, and England looked on with undisguised sympathy for those whom he had resolved to aid, Prussia was not only still full of her old purpose of attaining the headship of Germany, but was especially embittered against the suzerainty allowed by the Bund to Austria, ever since her own humiliation, partly through its means, at the hands of Schwartzenberg. The conduct of the French Emperor gave her the opportunity she longed for, and every page of her share in the negotiation of the spring of 1859 shows her resolve to have been first of all to make full use of it.

Much caution was needed for this end; for the French threat against Austria powerfully stirred the German mind. From all parts of the Bund came indications that the spirit of 1813 only slumbered, and that a statesman of power was all that was needed to raise it in such a form of universal hostility to France as might have swept the political divisions of Germany away for the time, and concentrated its military strength—as we witnessed two years since—in the hands of the Power which stood forth as the national champion. But Austria had no Bismarck in her hour of need, and the timid yet arrogant policy into which she was forced by her mixed dread of French aggression and jealousy of Prussian leadership was just what was needed to give her old national enemy the advantage in the field, as her German rival won it in the Cabinet. Austria herself soon gave the ready means of quarrel to the latter. Her ancient pride made her insist on seeking the help of Prussia only in the character of a member of that Bund of which she was nominally the head. At Berlin, however, it was natural to insist on the right of the Government to treat and act solely as

* *Der Krieg in Italien 1859, bearbeitet durch das k.k. Generalstabs-Bureau für Kriegsgeschichte.* Erster Band. Vienna: Gerold.

the great Power for which it had long been recognized. So the proceedings of the Prussian Military Commissioner at Frankfort, General Dannhauser, who would have met the wishes of the Vienna Cabinet, were promptly disavowed, and he himself was declared to have gone beyond the limits of his powers in agreeing to arm the frontier fortresses and collect German troops in the Palatinate. It was announced by the Berlin Cabinet that the conduct of Prussia must needs shape itself according to the causes of the coming hostilities. Should these result from the efforts of Austria to maintain the special conventions which extended her influence in Italy, there would be no proper cause for Prussian intervention. It would be well to show that France and Sardinia used them as a mere pretext for assailing the integrity of the Austrian dominions, before the Prussian State could be expected to make itself responsible for the latter. Later on the direct complaint was made that the Vienna Cabinet took far too little account of Prussia's rights as a great Power to act independently, and for the present it was intimated that Prussia could do no more than refrain from any assurance which should cause France to reckon on her neutrality. On her part Austria obstinately struggled against these pretensions, and did her best to stir up the minor States to a proper state of anti-Gallic sentiment. But the broad result was that Prussia played the game of delay too skilfully to let her and be forced, and when the growing feeling in favour of joining in the war brought her troops and those of the minor States upon the Rhine, their movement was so late, and the power of organization—so terribly developed at the expense of Austria seven years later—was so incomplete, that Solferino was fought and lost before they were ready to take part in a campaign.

Little of this section of the history is absolutely new, but the whole sequence of events in that fatal spring has never been so clearly set forth before. And we may say this particularly of our own tardy and blundering meddling, so ill-aimed of itself in its evident disregard of Austrian interests, and so imperfectly communicated at Vienna, that it is no matter of surprise in looking back that the advisers of Francis Joseph lost patience before its conclusion, and gave the signal for hostilities. Into this, in fact, they were purposely goaded by Sardinia, which Power, the French troops once being certainly put in motion, desired nothing so much as a speedy decision for war. It is impossible for any candid judge to blame the young Kaiser for this step. Under the circumstances it probably would have been the very best chance of saving his dissolving dominions. But the hopes of doing this were nullified by the signal blunder of his Cabinet in regard to the true seat of hostilities. Clinging still to the fast vanishing prospect of making the struggle a German as much as a French one, the Austrian Ministry kept their armaments more directed towards the Rhine than the Po. So, what with this error in their general design, and the desire to save expense by deferring the calling out of the reserves till the very last, the month of April came and passed, and Gyulai's force was quite inadequate to the task he originally intended for it of driving the Piedmontese army upon Alessandria, in order to shut it off from the coming French succour.

Nothing in this work is more honourable to its authors than the complete vindication of that veteran's reputation for judgment. The present War Minister, Baron Kuhn, came at the last moment to act as chief of staff to the ill-fated general; and we can hardly doubt that the care with which this part of the work is presented shows that he has resolved, late though the opportunity be, to free the honour of his former chief from the stains unjustly left upon it by his superiors. Gyulai's foresight as to the events which were to happen, his energetic and well-directed counsels, and his carefully weighed yet boldly strategic designs, might possibly have turned the scale had they influenced his master at Vienna. But here the genius of the Aulic Council still prevailed. Whilst Gyulai sought for reinforcements sufficient to enable him to execute his proposed task of dividing the intended allies, he was answered with long memoranda on the military resources available elsewhere. Whilst he asked at least to have his own command promptly made up to a war footing, he was told of the possibility of Austria's having to encounter Russian intervention. When, with prophetic clearness, he wrote just before hostilities, "I am thoroughly convinced that if Napoleon begins the war in Italy, he will carry it on with his whole might, for he puts his crown upon the die," the Vienna Cabinet still held to their belief that the real struggle would be upon the Rhine. More remarkable still, and pregnant with lessons to other nations, is the fact that, although Gyulai was able with his imperfect means to discount the coming French aid to Sardinia at 130,000 men—an estimate not far from the truth—the Vienna Cabinet imagined its own calculation to be correct which fixed its maximum number at 85,000. So little did the War Minister of Francis Joseph in those days understand the art which Von Moltke's Bureau—as we lately pointed out (*Saturday Review*, 2nd November, 1872)—for the first time in history has fully developed, of accurately calculating the resources of the enemy before going to meet him. We have not space to follow this interesting volume further than the point here reached. Were it only for its courage in publishing this mistaken calculation and its other errors of thirteen years since, the Austrian Government would fully deserve the credit which no reader of the work will be disposed to grudge it.

HARE'S WANDERINGS IN SPAIN.*

THERE are three ways of seeing Spain, according to the tastes and powers of as many different classes of travellers. You may follow beaten routes, say from Irun to Madrid and Madrid to Cadiz, thence coasting backwards to Barcelona, after having slightly diverged to such salient objects of pilgrimage as Toledo or Granada. Or, keeping to railroads and highways, you may visit decayed and deserted cities, from which the ordinary tourist is scared by the thought of the discomforts and difficulties that must necessarily be encountered in reaching them. Or, finally, you may "do" Spain after the good old fashion of that old-fashioned country, and as it ought to be done if it is to be thoroughly seen and enjoyed. You buy or hire a horse for yourself, you mount a servant on another; and if do not positively court adventures like Don Quixote, at least you make up your mind that the chance of meeting them shall add another charm to your journey. We need scarcely repeat that this last way is infinitely the most enjoyable for men of sound constitutions who have no objection to roughing it. You are as nearly independent as any one can be. You follow your fancies, stopping where you will; you may penetrate into the recesses of the magnificent sierras, you cross mountain spurs by wild bridle paths, you explore those picturesque *dehesas* and *despoblados* which lie apart from the monotonously cultivated plains. You mix with natives of all classes in a familiar way which is impossible to the stranger aristocrat who visibly condescends when he seats himself in a third-class railway carriage. Nor need your material discomforts be very great. It is true that your night quarters may be of the roughest when you congratulate yourself on the discovery of some solitary *posada* or *venta*. But strength, spirits, and appetite develop with the exercise and the bracing buoyant air; you carry a tolerably supplied larder in your saddle-bags, and your servant is probably no mean cook, while he has strict orders to exclude garlic from his cookery, and to see that the oil is sweet before he uses it.

Mr. Hare made choice of the second plan, which, although it is perhaps nearly as satisfactory for an amateur of architecture, archæology, and the arts, certainly involves many more disagreeables, while it can never be nearly so exhilarating. You must trust yourself everywhere to the tender mercies of other people, and you are forwarded, housed, and fed as it may please the superb indifference and dilatoriness of Spaniards. Your fitful rest is broken by starts at most untimely hours, and dragging along in the darkness in a dull train is a poor exchange for that joyous start in the saddle in the brightness or crispness of the morning air. You are hurried over the flattest country from one melancholy town to another yet more woebegone; and the hours of enchantment passed among the remains of some mouldering triumph of mediæval art but indifferently compensate you for those which must be spent in blank ennui in your bleak whitewashed chamber. It is almost inevitable that the spirits of such opposite modes of travel should impress themselves on the pages that describe them. Accordingly in Mr. Hare's wanderings we miss the wild romance of Borrow's *Bible in Spain*, although both gentlemen travelled in troublous times, while the country was disturbed by the persevering followers of Don Carlos. Yet, in its own way and so far as it goes, Mr. Hare's book is admirable. We say so far as it goes, because with all his artistic appreciation of things Spanish, Mr. Hare scarcely does the Peninsula justice, and the reason is that he has left so much of it unvisited. Had he merely gone from Cadiz to Algesiras on horseback, instead of by coasting steamer; had he made the familiar riding trip from Gibraltar into the grand Sierra of Ronda, as he intended; above all, had he embraced Yuste in his wanderings, and made his way into the wild forests of Estremadura, he would scarcely have written so sweepingly as he has done of the lack of timber, shrubbery, and vegetation in general. It is true that Ford, who perhaps knew the country better than any Englishman living or dead, talks of "torrid and tawny Spain." It is true that you may travel for days under the prevailing and depressing impression of broad baked plains and brown treeless mountain ranges. But, as Ford tells us too, in many a place even in the South and centre, you may ride for a long day through hanging woods and dense copses, by mountain streams that go leaping down to freshen the verdure of the meadows which they wind through in the valleys. Even when Mr. Hare excepts from his general condemnation Monserrat and Elche, the only "two places where there is anything that may be called beautiful country" out of the Asturias and Gallicia, he must surely have forgotten for the moment spots which he had visited himself—the Alhambra and the Generalife, with their perennial waters and verdure; some of the "bits" he must have passed in his expedition into the neighbouring sierra; to say nothing of those forests in the mountain gorges through which the railway is carried in the neighbourhood of Vittoria.

Be that as it may, however, Mr. Hare is too ardent and judicious an admirer of all that he found admirable to have done injustice wittingly; and it is better that a traveller should keep on the sober side than that he should prepare disappointment for those whom he invites to follow him. And this we may say with truth, that few men are better fitted than he to undertake the difficult task of describing scenes and manners which repeated descriptions should have made familiar. Mr. Hare

* *Wanderings in Spain.* By Augustus J. C. Hare, Author of "Memorials of a Quiet Life," &c. London: Strahan & Co. 1873.

wrote a good and suggestive book on Rome, but to our mind his book on Spain is a better one. He has the happy art of assisting memory by distinctive description. In a few telling strokes he touches off the salient characteristics that constitute individuality. If his vivid pictures necessarily resemble each other, they never repeat themselves. He carefully suits his epithets to the locality, in place of drawing them at random from a stock of set phrases of admiration and sensation. So we acknowledge his fidelity, and we fancy we should recognize his manner anywhere. For he is an odd mixture of the prosaic and poetical, and one's curiosity is generally alive to know how anything in particular may strike him. Here, as at the Alhambra, he pays the ordinary tribute to the romantic genius of the place, although his raptures are toned and tempered by his judgment. Again, he is particularly hard to please; it would seem as if for the time he looked on desolation or decay with the eye of a farmer from the Lothians or an architect of trim suburban villas. We can understand that, to one waking in the railway train in the cold and gloom of a winter morning, the wilderness to the west of Tudela should seem "dismal and barren." But certainly we should never have dreamed of denouncing Valencia as "a concentration of dulness, stagnation, and ugliness." We should have fancied the quaint market-place, with its silk hall, and ancient houses with their Flemish-like gables or florid façades, would alone have sufficed to relieve it from the latter imputation.

But when Mr. Hare is impressed and disposed to admire, when historical and legendary associations add interest and charm to the grandeur of architecture in ruins, then he is a most captivating companion, and his pages are delightful reading. He is at his best perhaps on the occasion of his visit to Poblet; certainly no chapter in the book is more fascinating. It is partly perhaps because the place is so seldom visited, and because so little is known generally of its history. Strangely enough the latest edition of Murray cuts down to a few sentences the column and a half which Ford devoted to it in the older one. The site of the convent is sequestered, and the disagreeables which Mr. Hare and his party encountered in reaching it illustrate the drawbacks to expeditions by byways in Spain, when you have not a horse of your own to trust to. Dropped at Montblanch station as morning was breaking, the party was fortunate in discovering a man in the ragged group of idlers who was the proprietor of a *tartana*. The vehicle, indeed, though it was dignified by that name, by no means answered to the description. We doubt if it was covered; it consisted of a rude framework of open bars roughly nailed together and covered with carpet, while the bottom was of knotted rope. The road was in keeping with the carriage; bare rock alternated with profound pools of mud; and the occupants lurched and jolted along, as the mule was urged on by the shrieks and yells of the driver, until at last they were compelled to descend and complete the pilgrimage on foot. No doubt it repaid them, and the description of the picturesque approach is a good specimen of Mr. Hare's style:—

> The sun was just breaking through the clouds which had obscured the earlier morning, and lit up the lonely hollow of the hills in which the convent is situated. Venerable olive trees, their trunks gnarled and twisted into myriad strange forms, lined the rugged rock-hewn way; and behind them stretched ranges of hills, here rich and glowing with woody vegetation, where the sun caught their projecting buttresses, there lost in the purple mists of their deep rifts. The approach to a great religious house was indicated, first by a tall stone cross rising on a lofty pedestal, stained with golden lichen, and with myrtle and lentisk growing in the hollows of its grey stones, then by a strange group of saintly figures in stone, standing aloft amid a solitary grove of pillars at a crossway.

No remains elsewhere, he remarks, impress the visitor with the same sense of melancholy. The ruin is so recent, the rents, rifts, and fractures are so fresh and sharp; time has drawn no mantle of venerable vegetation over them; "violence and vengeance are written upon every stone." Founded by Raymon Berenguer in the middle of the twelfth century, on the spot where a miraculous light had revealed the body of a holy hermit who had fled from Moorish persecution, Poblet, as it was named after the Saint, was richly gifted and endowed by the successive monarchs of Aragon. They made it their last resting-place; princes and nobles aspired after burial in that hallowed ground; even the bishops of Tarragona and Lerida evinced their sense of its superior sanctity by quitting their own cathedrals for tombs in its transept. The abbot was a power in the State; it was with extreme difficulty that admission was obtained to the monastery, and the monks on entering renounced none of the pomps and vanities of the world. As they grew richer, adding domain to domain and manor to manor, they became prouder and more exclusive. From five hundred they reduced their number to sixty-six. Each candidate had to prove his descent as a grandee of Spain, and "the Chapter sat in solemn deliberation upon his quarterings." Each monk had his servants, and rode on a snow white mule, procured for him regardless of expense. It was said that, in the pride of the arrogance that was sanctified by religion, they cruelly abused their influence and power. There were whispers of missing men, and of dungeons that concealed stories of sanguinary cruelty. At last the day of reckoning came, and the pride of the convent had a fall as sudden as it was tremendous. The monks turned informers on each other when political animosity began to run high in the community during the Carlist troubles. The excited populace rose and broke into the convent. Doors were forced everywhere, and nothing was sacred to the intruders. The secrets of these mysterious dungeons were brought to light, and the discovery of bones and instruments of torture confirmed the heavy charges that had been brought against the community. For once the local authorities chanced to be strong and energetic, and they secured twenty-four hours' law to the monks, who saved their lives at the sacrifice of all their property. Since then it has been as much as their lives were worth to revisit the scenes of their former glory and luxury. Mr. Hare tells their story well; and indeed one of the charms of his volume is the number of legends and anecdotes that the traveller will seek in vain in the guide-books. We are sure that no one will regret making it the companion of a Spanish journey, and it is a book that will bear reading repeatedly when one is moving among the scenes it describes—no small advantage when the travelling library is scanty.

THE MORMONS AND THE SILVER MINES.*

MR. BONWICK is not a traveller of a very high order. He has no great power of style, nor has he anything very remarkable to describe. A great deal has recently been written about the Far West of America, and we cannot discover that he has enjoyed any unusual opportunities of observation. He speaks, indeed, as one who has had some experience in mining; and the chapter which he devotes to the geology and the economical conditions of the mining districts of the Western States may be worth notice by persons who think of embarking capital in the promotion of American industry. The subject, however, is rather too technical to be of general interest; and Mr. Bonwick presents himself chiefly as an observer of the strange religious developments of the United States. Though, as we have said, he tells us little that is new, and fails to place old information in a new light, he contributes something to a picture of a singular state of things. Mr. Bonwick probably represents the impression made upon an Englishman of average capacity, but of more than the average freedom from prejudice. The tone in which he speaks of the Mormons and of the strange sects which grow up in the Eastern cities suggests that whilst on the spot he sympathized with them to an extent of which he is now a little ashamed. After giving us a highly favourable account of the Mormons, he remembers that their peculiar institution is hostile to sound morality; and after speaking much more respectfully than we could wish of certain notorious female agitators in New York, he apologizes by declaring that the home which they attack is "something more than the bulwark of civilization"; and compares it to a desert flower, to the "morning rose-tint of Alps," and to various other beautiful objects. Perhaps, indeed, Mr. Bonwick may be ironical in some of the commendations which he bestows upon the anti-social agitators. Without settling that point it is as well that we should occasionally read descriptions of these social curiosities, not too deeply coloured by the disgust which they are apt to excite in well-regulated minds. Mr. Bonwick's tolerance does not lead him to any descriptions of an offensive kind; his book is perfectly decent—a fact which we regret that it should be necessary to state explicitly—and if he is not a philosopher, he may supply some food for philosophical meditation.

Few things, indeed, are more curious than these singular growths of modern superstitions which are essentially as grovelling as the old belief in witchcraft, and which yet are oddly tinged by stray scraps of scientific knowledge. We do not ask how large a place is held in America by Spiritualists, Shakers, "Christadelphians," advocates of Free-love, and adherents of a number of other more or less objectionable sects. Doubtless it is true that their prevalence has been very much exaggerated; some of them are of European origin, and others, like the Mormons, draw most of their recruits from this side of the ocean. Persons who trade upon indecency are apt to be noisy, and find their account in exaggerating their numbers and importance; and, in short, a traveller in America is apt to think that the phenomenon has been made much more conspicuous than it deserves. Still it is undeniable that the conditions of American thought and society are favourable to the development of certain morbid social and religious growths. The anarchical theory that one man's opinion is as good as another's leads all kinds of persons to set up as prophets who would be crushed by a sense of their own insignificance in a country where culture is more thorough, if restricted to fewer persons. The absolute tolerance which prevails encourages people to look with comparative indifference even upon theories which strike at the root of all morality. And anybody who has a gift for unctuous rhetoric and a slight tincture of scientific and metaphysical jargon can start as a reformer of the universe, and find plenty of half-educated people whose eagerness for novelty is developed out of proportion to their capacity for reasoning. A certain Dr. Thomas, for example, who died recently, started the "rapidly extending sect" of the Christadelphians. Dr. Thomas, we are informed, was "esteemed by the Rev. Dr. Cumming as a learned expositor" of the Apocalypse; and to be esteemed by Dr. Cumming is, it seems, enough to justify an American in founding a new religious sect. We are only treated to a few of his dogmas, which appear to have been reached by the Doctor's method of Biblical interpretation. He holds the soul to be mortal, whilst the Mormons hold it to be immortal, although material. Dr. Thomas says that "the Protestant abominations are all based upon immortal-soulism." He thinks, however, that the saints will reappear in mortal bodies which will have "pre-resurrectional consciousness

* *The Mormons and the Silver Mines.* By Jas. Bonwick. London: Houlder & Stoughton. 1872.

fleshed upon them." We are further informed that he holds that "electricity is the term science has bestowed upon what the Bible calls spirit," electricity being with ignorant people a general name for anything which they don't understand. He considers that the Mormons, who hold somewhat similar doctrines, are wretched imposters, and that their divinations are "only lying rhapsodies, the dark and malarious thinkings of nervous flesh rioting in the spectralia of musty theosophisms, talked into the Bible by the Gospel nullifiers and pulpit mar-texts of the chairs and sacred desks of Christendom." There is apparently some glimmering of sense in the earlier part of this beautiful sentence; but the Doctor was scarcely qualified to be the founder of an elevating religion. We have no reason, however, to suppose that he was as objectionable a person as some of the other teachers to whom Mr. Bonwick refers. Mr. Bonwick speaks, for example, with a certain respect of that notorious lady, or as an American journalist calls her, "that high old gal," Victoria Chaplin Woodhull, "perhaps the best female lecturer in the world." This lady, who is believed to "spend a part of the day in silent communion with the other world," and who in her *séances* "delivers orations of no mean order," has had a very singular career. She was married at fourteen to a Dr. Woodhull, who is "spoken of as something worse than ordinary human nature." Leaving him, she became a medium. She got a divorce and married a Colonel Blood, who, having called to consult her as a "spiritualistic physician," was surprised to hear her in a trance declare herself to be his other half. Victoria, however, induced him afterwards to consent to a divorce, in order that "they might live in a union upon its own merits." She and her "gifted sister Chaplin" have set up a stockbroking business, besides attending to politics, Spiritualism, and the Woman's Rights movement. She was aided by the spirit of Demosthenes in composing an address to Congress in favour of female suffrage. Her admirer, Theodore Tilton, declares that her ambition is stupendous. "She can ride like an Indian, and climb a tree like an athlete; she can swim, row a boat, and walk all day like an Englishwoman." Blood and Woodhull, her two former husbands, both lived in her house; and as this peculiar arrangement gave rise to scandal, Mr. Tilton exclaimed, in the words of Tennyson,

> Is thy white blamelessness accounted blame?

She has views on the currency question; she was proposed as a candidate to succeed General Grant; and the *Golden Age* says of her that "she beats her daily gong of business reform with notes not musical but strong, yet mellows the outward rudeness of the rhythm by the inward and devout song of one of the sincerest, most reverent, and divinely gifted of human souls." To all which we ought to observe there is an appendix not mentioned by Mr. Bonwick. Probably his book was in the press before the latest news of Victoria's performances. At present we have reason to suppose that she is beating her daily gong in a New York prison. She and her gifted sister published a paper called *Woodhull and Chaplin's Weekly*, of which Mr. Bonwick gives some account. The last number of this precious periodical succeeded in outraging the rather lax morality of New York to such an extent as to provoke the authorities. According to the New York *Nation*, the paper never paid, and Woodhull, Chaplin, and Blood had to discontinue its publication. But, "being in pressing need of some social reform, as they say, they resuscitated their paper after it had been some months dead, and published one number which was of an open and shameless rascality never before ventured upon by them." They were consequently prosecuted for the dissemination of obscene literature, and we can only hope that they may receive their deserts. The white blamelessness of the divinely gifted soul does not seem to have protected it from very unpleasant imputations. The fact is, that Victoria and her companions have done a great deal to provoke utter disgust towards the Woman's Rights movement in America amongst all respectable people, and we would hope that Mr. Bonwick was led to exaggerate the influence which it exercised amongst other classes.

The social peculiarities of the Mormons, though bad enough, are not of that revolting character which characterizes some of the obscure associations to which more than enough prominence has recently been given. Mr. Bonwick speaks, on the whole, much as other travellers have done of the external decency and apparent content of the Mormon women. One or two facts which he mentions help to explain why polygamy has succeeded so far as it has done amongst the Mormons. The fact is that wives are a very good commercial investment in a thinly-settled country. There are Mormons, we are told, who have "partners located in all the leading cities of the territory." A gentleman engaged in commercial pursuits thus finds a convenient home in his varying quarters. The ladies are expected to earn their own living and keep their children. A Gentile, says Mr. Bonwick, informed him that "these wives, judiciously placed out, would pay from twenty to fifty per cent. upon the outlay of capital, besides furnishing free quarters when the collector went his rounds." Some of the evils connected with the ordinary disproportion of the sexes in new colonies are avoided, though few persons will assent to Captain Burton's theory, which, if we remember rightly, goes the length of justifying the institution under these circumstances. A strict spiritual rule and an abundance of wives may doubtless keep things quiet and be favourable to industrial activity. But, in spite of the external tranquillity, we have no doubt that the price paid for the system in the long run is a heavy one. Its essential immorality is indicated by the extreme facility of divorce, especially when a bishop or other ecclesiastical dignitary is a rival of the husband; whilst, as Mr. Bonwick assures us, the Mormon schools are disgracefully neglected, and the rising population are in the habit of reading nothing but the most offensive trash published in New York. The whole community is endangered, not merely by the direct attacks of Gentiles, some of which, carried on under pretence of law, appear to be of the most unscrupulous kind, but by the facility now afforded for the growth of new sects. Mormonism has its dissenters, and they express themselves pretty freely. The Josephites, as we know, are opposed to polygamy, whilst the Godbeites, whom Mr. Bonwick compares to "our own Dean Stanley's school," go in for very rationalistic modes of thought. They believe in the right of private judgment, and sneer at Brigham Young's infallibility. The Mormons, says their organ, have

> their baptisms, confirmations, genuflexions, priesthood — apostolic and Aaronic; a brimstone hell, a purgatory, works of supererogation, and all the namby pamby fooleries of priestcraft, only to be tolerated in an Indian medicine-man, or in a leader of some rude hordes that can only be governed by an appeal to their superstitions or fears.

This strange caricature of higher religions has evidently its heresiarchs and its schisms as well as its Pope, and the Pacific railways make it impossible for the orthodox to apply those vigorous measures of repression which might have kept things together yet a little longer. The year 1890 is to be the beginning of their millennium, and the new Jerusalem is to be built in Jackson County, Missouri. Perhaps by that time this curious development will have shown unmistakable symptoms of collapse. We could wish that, whilst yet in its vigour, it had been investigated by some more competent observers. Mr. Bonwick, like his predecessors, seems at best to have had but a cursory and superficial glimpse of its peculiarities.

MAYOR'S JUVENAL.*

In its original form Mr. Mayor's *Juvenal* seemed, even if it was not, a voluminous mass of learned but ill-digested commentary. Perhaps our prejudice against it was partly due to its learning taking the form of foot-notes which often outran the page in which the word to be annotated occurred. But, in the form in which the work now reappears after an interval of nearly a score of years, so much has been done for it in the way of judicious rearrangement and of relegating the notes to the end of the volume, that a considerable addition of matter is carried off without producing an impression of prolixity or verbosity. While the editor elucidates a carefully considered text so as to leave no doubt about its sense, he has also illustrated every characteristic passage of the vehement satirist of the Empire by curious contemporary parallels from Seneca, Martial, Petronius, and many Latin writers of the silver age, so that in reading a Satire with the help of his notes we feel ourselves thrown back into Imperial Rome, and acquire an intimate knowledge of its characters, manners, and customs. In Mr. Walford's volume on Juvenal in Mr. Lucas Collins's series, life at Rome under Domitian is brought before us in a lively and striking series of word-pictures; but for the scholar, especially the young scholar, there is a mine of information and of solid profit to be derived from the study and digestion of such exhaustive and comprehensive notes as those in which Mr. Mayor sets before his readers the whole form and fashion of a Roman book (i. 6); the curious details of Roman horticulture (i. 75, pp. 124-6); the history of Tyrian dyes, from the time of the Exodus till that of Benjamin of Tudela, A.D. 1161; the tricks and profits of Roman informers; the mysteries of poisoning, of gourmanderie, of horse-keeping, and a hundred other features of Rome as it appeared to the stern gaze of the trenchant satirist. Indeed the matter brought together in any one of these and similar notes presents very much the same sort of interest as a chapter or section of Böcker's *Gallus;* with this difference, that in the latter a story is illustrated by the results of collateral reading, and the student is mostly sent away with a reference to parallel passages, of which he is apt to postpone the verification, while in the volume before us his curiosity is not taken for granted, and the annotator deems it safest to give him *in extenso* such quotations and illustrations as he thinks necessary. Nor are these exhaustive notes likely to be valuable only to young students at school or college. They contain a fund of materials for elder readers, and enable us to compare ancient and modern society. Even for mere gossip and curiosity it is pleasant to be posted up in such matters as the citrus-wood tables in fashion when Juvenal was writing his Satires, and to learn that the slabs most approved for their manufacture grew in Mauritania, and had tiger-like stripes, or panther's spots, or a wave-like curl in their grain resembling the eyes in a peacock's tail. This last fashion of festive board recalls the "Lectus pavoninus" of Martial, *Ep.* xiv. 85; and we have an impression that cabinet-makers still set a high value on the same appearance of grain in Spanish mahogany, which is an exception to the general rule of an undulating or wavy marking of the wood. We are told in a note on the *orbes*, or circular tables, so much in vogue in Juvenal's day, that, to suit their shape, semicircular couches called "sigmata" (from the Greek letter) were substituted for the rectangular "triclinia." "On such a *sigma* Elagabalus entertained eight bald, eight one-

* *Thirteen Satires of Juvenal.* With a Commentary. By John E. B. Mayor, M.A., Fellow of St. John's College, Cambridge. Second edition, enlarged. Parts I.-II. London: Macmillan & Co. 1872.

eyed, eight gouty, eight deaf, eight black, eight tall, and eight stout guests; the last company could not squeeze into the space." Passing from tables to the viands on them, the reader who cares to peruse Mr. Mayor's note on i. 141—"animal propter convivia natum"—will find something to retail to his gourmand friends with regard to the extravagance and expenditure in ancient kitchens. A story is hunted up from Plutarch of one Philotas, a medical student at Alexandria, who saw in the kitchen of Antony, amongst other provisions, eight boars a-roasting:—

He was amazed at the number of the guests. "Nay," said the cook, "the guests are not many, about twelve, but Antony must have his meat done to a turn. He may call for his dinner at once, or presently, or he may defer it. Hence it is necessary to prepare not one dinner, but several."

Such stories of the mad freaks and extravagances of Roman voluptuaries may be deemed by severe and austere scholars—who care for nought but comparison of manuscripts, and weighing one edition of a German editor's text against another—an excessive condescension to the appetite of the general reader for amusement; but we confess that we approve of Mr. Mayor's pleasant industry.

The two instalments before us represent about half of Mr. Mayor's projected undertaking. The First and a part of the Third Satire have been most copiously annotated, and in them are to be found most of those exhaustive notes of which we have been speaking. From that point to the end of the Seventh Satire—the limit reached in the Parts before us—the notes of the first edition are more sparingly augmented by new material, but the citations throughout have been taken anew from the original authors, and the whole labour bestowed is obviously genuine and at first hand. Nor, indeed, does the absence of a profusion of illustrations after the 182nd page, for which the editor apologizes, disappoint the reader, because in what has gone before so many subjects have been fully treated that a more sparing commentary might almost be deemed desirable.

For holding well in hand the thread of Juvenal's arguments as he declaims against the general luxury and licence and corruption of Roman life, the running commentary with which Mr. Mayor prefaces each new turn of thought will be found very serviceable. We think, too, that readers will discover in his notes a confirmation of his assurance that he has abstained from "consulting any English edition of Juvenal," for they are singularly free from hackneyed and re-cooked matter, and they constantly clear up a doubt or difficulty which other commentators have passed over in silence. We have rarely sought a solution of conflicting views from this edition without finding satisfaction and conviction. For instance, it is rather staggering, in the opinion of many commentators, that when the rich client goes with an empty litter to claim a double share of the sportula—

Ostendens vacuum et clausam pro conjuge sellam,
"Galla mea est," inquit; edtius dimitte; moraris.
Prefer, Galla, caput (i. 126)—

it is the butler or the "balneator" who utters the last words. It must strike every one that it is the husband who utters the whole speech. Macleane and Prior hold the former view, and Simcox, one of the most recent editors of Juvenal, is silent on the matter. Turning to Mayor, we find him agreeing with Jahn in referring the words to the husband, whose effrontery is thus enhanced and rendered more astounding. *A propos* of this device to get a second dole, Mr. Mayor has cited from Jerome the story of a sturdy female beggar who got a blow for a second dole:—"Pugnus porrigitur pro denario et tanti criminis reus sanguis effunditur." In the supposed speech of Umbricius, when he is leaving Rome because honest merit has no scope there, occur these words among other disqualifications:—

Me nemo ministro
Fur erit, atque ideo *nulli comes exeo*.—iii. 46, 47.

Macleane's interpretation of this passage—namely, that Umbricius complains of never being any great man's walking companion because he is no hand at thieving and peculation—appears singularly bald and unsatisfactory. But Mr. Mayor's solution recommends itself to confident acceptance:—"No governor takes me out to a province in his cohort, because I will bear no part in his extortions." Such a one wants a ready aide-de-camp and accomplice, a cool hand, clever and apt at tricks of theft and extortion. What makes this interpretation so certain is, as Mr. Mayor points out, the mention of Verres in the context. The "fur" and the "comes" are both represented in the lines

Carus erit Verri qui Verrem tempore quo vult
Accusare potest.—iii. 53, 54.

Again, in the passage about the dress of the spectators of country plays in an extemporized grassy theatre (iii. 177, &c.), there has been some confusion heretofore about the lines—

Æquales habitus illic similemque videbis
Orchestram et populum; clari velamen honoris
Sufficiunt tunicæ summis sublibus albæ.

Gifford, Macleane tells us, fell foul of Dryden over them. Yet Mr. Mayor brings out the sense sufficiently when he notes that "in the rustic crowd there is no distinction of the 'latus clavus' or 'angustus clavus,' nor any prætexta; the municipal senate who occupy the orchestra, as the senators do at Rome, are dressed like the rest of the spectators, in tunics." Upon the debated words "Iam quartanam sperantibus ægris" the interpretation of Mr. Mayor is the same with that of Macleane and others, who refer them to patients hoping that their disease will be turned at autumn-tide into a quartan fever, if not cured entirely; and this is certainly better than to take "sperantibus" with Ruperti for "apprehending the advent of" such a disease.

The same sort of help is tendered by this editor to those who hesitate between various readings. In the lying excuse for Galla not putting her head out of the sedan or litter to which we have referred above, the husband's last words are "noli vexare, quiescit," in most modern texts. But Mayor justifies the MS. reading "quiescet," and illustrates the idiom, which is English as well as Latin, by a parallel from the *Phormio* of Terence, where the words "Sic *erit* (you will find it is so), non temere dico," are a case in point. In like manner he supports, at i. 146, the less easy reading "plaudendum funus," as against the more obvious "plangendum funus." In iii. 240 he reads with much plausibility, "Ingenti curret super ora liburnâ," taking the last word for a kind of litter so called, and preferring its presence in the line to "Liburno," which would denote the bearer of such a litter. In iv. 3 he retains the reading of the best MSS., which appears to have been that also of the Scholiast, wherein Crispinus is characterized as

Ægro solâque libidine fortes
Deliciæ.

i.e., "a rake, feeble and resolute only in his lusts." Here again those who refer to the usually printed text will see that the latest editor has not chosen the least difficult reading.

In deciding upon questions of various readings Mr. Mayor has called in, in several cases, the acute judgment of Mr. Munro. This is always instructive, and, in the case of the annotations before us, not the smallest of their many recommendations. In the vexed question which arises at the opening of the Third Satire (vv. 12–20) as to the adoption or rejection of Jahn's transposition, which places vv. 12–16 after v. 20, ending with "violarent marmora tophum," Mr. Munro advocates a conservative policy, because else "In vallem Egeriæ descendimus" is too abrupt. He takes it that the lines, as they stand, represent Umbricius halting at the Porta Capena, and his after movements and remarks. *Hic* in v. 12 means simply "hereupon" or "upon this," and *ubi*, which begins a parenthesis continued to "camœnis," is equivalent to "illuc, ubi," "to where," the epexegesis of which is to be looked for in "In vallem Egeriæ descendimus." Thus, as he puts it, the sense will be, "Hereupon he and I went down to where Numa used to meet his mistress, but where now . . . I mean into the valley of Egeria." "Hic tunc," in v. 21, is taken as beginning a new sentence. In such arguments for resisting change we must profess ready acquiescence. Again there is the line in iii. 218:—

Phœcasianorum vetera ornamenta deorum;

Or, according to two MSS. which the Scholiast seems to have followed—

Hic Asianorum veteres, &c.

Even if we adopt the suggested emendation Hæc for Hic, the latter reads awkwardly. And the upshot of Mr. Munro's strong suspicion "that in some form or other 'phœcasia' should come in, as this word is not uncommon in Latin to express apparently some luxurious kind of shoe," is that Mr. Mayor adopts Roth's conjecture "Phœcasiatorum," which is a likelier form than "phœcasianorum," at the same time that, with his ever-ready apparatus of parallels, he gives chapter and verse for the use of "phœcasiæ" at Athens and Alexandria. One more glance at Mr. Munro's criticisms and we have done. In iv. 67 the Picenian fisherman, having taken his huge "rhombus" to the Emperor, exhorts him in a strange mixture of courtly and uncourtly language to have a feast of it. Before uttering the outrageous flattery that the fish had waited for Domitian's reign, and then volunteered to be caught (68–69), he has bidden him "propera stomachum laxare saginis." The last word so read conveys an intelligible sense, though some have proposed to read "saginæ." But "saginam" and "saginas" are unfortunately the best attested readings, and at the same time defy explanation. Munro's suggestion is an extremely simple and plausible one—namely, to read "saginans"—so that the sense may be "let your stomach out by cramming it"; "give yourself a good blow-out." Enough has been said to show the chief characteristics of Mr. Mayor's enlarged and improved *Juvenal*, without going into the other Satires annotated in the instalments before us. Young students are happy who, with plenty of leisure and a fair share of scholarship, become acquainted with Juvenal under the agreeable escort of Mr. Mayor.

WILSON'S MEMORIALS OF EDINBURGH.*

SOME twenty years ago the inhabitants of Edinburgh—especially those of them who affected literature or science—were familiar with the appearance of two men, rather of the rising than of the descending, or even the stationary, generation. They were brothers—Daniel Wilson and George Wilson. And, by the way, turning at this point, as people do who are not certain about dates or names, to the *Men of the Times*, letter W, we read, "Wilson, Daniel, LL.D., born at Edinburgh in 1816, is an elder brother of Professor George Wilson, the eminent chemist, and a nephew of Professor John Wilson—the Christopher North of *Blackwood*." This latter relationship would have amazed an Edinburgh citizen of the period, not only by its inaccuracy, but by its absurdity. Not

* *Memorials of Edinburgh in the Olden Time.* By Daniel Wilson, LL.D., Professor of English Literature in the University, Toronto; late Acting Secretary of the Society of Antiquaries of Scotland. Edinburgh: Andrew Elliot. London: Simpkin, Marshall, & Co. 1872

that there would be any disparagement on either side in such relationship of uncle and nephew, but that, from the total difference in the cast of life, as it were, between them and the burly author of the *Noctes* with his jubilant love of society and field sport, the association in any way with the two studious slaves of the lamp has a touch of incongruity. Of the two brothers, Daniel was—and still is, let us hope—noticeable among men as tall, wiry, and erect. His brother the chemist was small, and so sickly and fragile in aspect that one had a nervous feeling, when he was present, as if some fit or worse might befall him; and yet, living, as his existence and capacity for work demanded of him, a hermit's life of abstinence, in company the genial spirit within him shone forth and made him as full of pleasant talk as any Hercules of the table who could partake of many courses and many bottles. He had the art of expressing scientific mysteries with singular clearness and attractiveness, and his eminence secured for him the distinction only given to the chiefs among men; a separate memoir of his life and labours proving a popular and successful book.

The elder brother, Daniel, gave himself to archæology and art. The drawings for the present work are his own. In 1853 he was tempted to leave Edinburgh, and became Professor of English Literature and History in the University of Toronto. This appointment was, to borrow an expression from physical science, a sad waste of power. Men who can lecture on literature, and go over the history of the world by useless abridgments, and still more useless reflections, are easily found. Wilson, however, was an archæologist, having taken for his subject, as all men should do, the place where he found his opportunities of research and exemplification, and that place was his native country, Scotland. That a man such as this should feel constrained to become an exile from the natural field of his instructive labours is a reproach to our public institutions, as not supplying, in the shape of professorships or otherwise, due encouragement for the acquisition and propagation of archæological learning. Archæology is essentially that element in history which, as being of the nature of a science, can be dogmatically taught. We may not believe in the chronological sequence of the Stone, the Bronze, and the Iron ages as an exact and exhaustive analysis, but it is a division admitting of a very instructive arrangement of the several known examples of early mechanism. It is as in geology—the phenomena of subsidence at one cosmic period, or eruption at another, set forth as the active phenomena creating the present crust of the earth, may be open to dispute; but the separation from each other of the strata so accounted for has afforded wonderful suggestions and facilities for the classification of the features appropriate to each. We need but glance at Worsaae's *Nordiske Oldsager*, with its treasure of ancient remains, conveying the fruit of the skilled labours of the archæologist to the popular eye, to see on the part of the Northern nations an example that should put us to shame in the matter of studying and teaching the existing witnesses to the habits and arts of our early ancestors. An enthusiastic archæologist whose wealth sufficed not only for his own pursuit of his favourite science, but for the help of less prosperous persons who might desire to follow it, lately left an endowment for a Chair of Archæology in Edinburgh. It happens that the funds for the purpose are not immediately available, and the Government, as we understand, when solicited to supply the means of interim support for the Chair, has declined to make the necessary advance.

Dr. Wilson is favourably known to the inquiring part of the world by his great archæological work, called *Prehistoric Annals of Scotland*. If that assumes the higher place in the library, the present volume, partaking of art and light literature, must take precedence on the drawing-room table. Each carries with it a mark of the local difficulties which the author had to contend with. Of both books the original edition was published before the author left Scotland. When a second edition of the "Prehistoric Annals" became due, he found that he could not do it justice without returning to Scotland to see it through the press. There can be no doubt that anything accomplished on such a hurried visit would give but poor results in comparison with the rich harvest of new matter that he might have garnered up at his leisure had he remained in the land of his sculptured stones, Picts' houses, and elf arrow-heads. The other work he did not consider of importance enough to demand such a sacrifice. But, living at a distance, he did not venture to make any improvements. It is consequently an exact reprint of the original book, and tells the reader that it is so. Time, however, which renders many things worthless, has enhanced the value of the book without its author's co-operation. It contains spirited and accurate accounts of old buildings, and also of social institutions, that have disappeared since it was first published in 1847. What is still more valuable, it contains the old engravings of the departed buildings, preserving the surrounding local conditions, which are now in many instances as thoroughly changed as the buildings themselves are by alterations and reconstructions.

The portly and somewhat gorgeous aspect of the book would not naturally suggest the nature of its contents, as a collection of traditions, anecdotes, and discourses on the localities of historical events, and on the dwelling-places and social habits of eminent men. Hence it is rife with the names and events popularly connected with Scotland—Queen Mary and the tragedies of her life, John Knox, Montrose, Claverhouse, Prince Edward and the Forty-five, the Covenanters, the Porteus mob, and Walter Scott. Where, among all, shall we select a characteristic specimen? Suppose we go out of this pleasant but terribly beaten path, and look for a person so little in the estimation of romance-lovers as Oliver Cromwell? Some notices of his abode in Edinburgh and of his dealings with Scotland will perhaps show that Dr. Wilson can appreciate the significance of things that may not have gained the sanction of vulgar popularity:—

On the 7th of September 1650, Cromwell entered Edinburgh at the head of his army, and took possession of it and of the town of Leith. The capital was now subjected to martial law; the most rigid regulations were enforced, such as, "that upone ony allarum no inhabitant luik out of his hous upone payne of death, or walk on the streets after top-tow, upone payne of imprisonement." Yet the peaceable inhabitants found no great reason to complain of his civic rule; justice seems to have been impartially administered, though often with much severity, and the most rigid discipline enforced on the English troops. "Upon the 27th of September," says Nicol, "by orders of the General Cromwell, thair wes thrie of his awin sodgeris scurged by the Provest Marschellis men, from the Stone Chop to the Neddir Bow, and bak againe, for plundering of houssis within the toun; and ane uther sodger maid to ryde the Meir at the Croce of Edinburgh, with ane pynt stop about his neck, his handis bund behind his back, and musketis hung at his feet, the full space of twa hours, for being drunk." The same punishment of riding the Mare remained in force, as a terror to evil doers, till the destruction of the old citadel of the town-guard, and all its accompaniments, in the year 1785.

The General again took up his residence in "the Earl of Murrie's house in the Cannigate, where a strong guard is appointed to keep constant watch at the gate;" and his soldiers were quartered in the palace, and billeted about the town, while actively engaged in the siege of the Castle. The guard-house was in Dunbar's Close, a name which it retains from the quarters it then furnished to the victors of Dunbar! and a tradition is preserved, with considerable appearance of probability, that a handsome old house, still remaining at the foot of Sellars' Close, was occasionally occupied by Cromwell. It is a fine antique mansion, which forms a prominent feature in the view of the Old Town from the north, having two terraced roofs at different elevations, guarded by a neatly coped parapet wall, and commanding an extensive view of the Forth, where the English fleet then lay.

* * * * * *

The siege of the Castle was vigorously prosecuted: Cromwell mustered the colliers from the neighbouring pits, and set them to work a mine below the fortifications, the opening of which may still be seen in the freestone rock, on the south side, near the new Castle road. The commander of the fortress had not been, at the first, very hearty in his opposition to Cromwell, and finding matters growing thus desperate, he came to terms with him, and saved the Castle being blown about his ears, by resigning it into the General's hands.

One of the earliest proceedings of the new garrison was to clear away the neighbouring obstructions that had afforded shelter to themselves in their approaches during the siege. "Considering that the Wey-hous of Edinburgh was ane great impediment to the schottis of the Castell, the samyn being biggit on the hie calsey; thairfoir, to remove that impediment, General Cromwell gaif ordouris for demolisching of the Wey-hous; and upone the last day of December 1650, the Englisches began the work, and tuik doun the stepill of it that day, and so continued till it was raised." We learn, from the same authority, of the re-edification of this building after the Restoration. "The Wey-hous, quhilk was demolesit by that traitour Cromwell, at his incuming to Edinburgh, eftir the feght of Dunbar, began now to be re-edified in the end of August 1660, but far inferior to the former condition." The cumbrous and ungainly building thus erected, remained an encumbrance to the street, at the head of the West Bow, till 1822, when it was hastily pulled down, to widen the approach to the Castle, preparatory to the public entry of George IV.

The following passage, if not so historically important, is perhaps more curious, and will surprise those readers who are accustomed to consider Cromwell as the tyrant of Scotland as he was of Ireland. The Scots did not like his method of coming to them in the disastrous affair of Dunbar, and it can hardly be said that he acquired popularity among them. There was a sort of surly sense, however, that his rule was salutary. He tried to give them a fair representation in Parliament. He opened to them the trade of England. He bridled the Highlanders and the Border rievers—those of England whose plundering ground was in Scotland, as well as those of Scotland whose depredations in England were not profitable to their countrymen at large. The industrious peasant in Moray, Aberdeenshire, Angus, or Selkirk felt himself in the hands of a genuine protectorate, and could sleep without disturbance from the thought that in the morning he might find his barns burnt and his cattle gone:—

So acceptable had the sway of the Lord Protector become with the civic rulers of Edinburgh, notwithstanding the heavy taxes with which they were burdened for the maintenance of his army, and the general expenses of the government, that they commissioned a large block of stone for the purpose of erecting a colossal statue of his Highness in the Parliament Square.

The block had just been landed on the shore of Leith, when the news arrived of Cromwell's death. Monk altered his policy, and the magistrates not only found it convenient to forget their first intention, but with politic pliability, some years after, they erected the fine equestrian statue of Charles II., which still adorns that locality. The rejected block lay neglected on the sands at Leith, though all along known by the title of Oliver Cromwell, till, in November 1788, Mr. Walter Ross, the well-known antiquary, had it removed, with no little difficulty, to the rising ground where Ann Street now stands, nearly opposite St. Bernard's Well. The block was about eight feet high, intended apparently for the upper half of the figure. The workmen of the quarry had prepared it for the chisel of the statuary, by giving it, with the hammer, the shape of a monstrous mummy, and there stood the Protector, like a giant in his shroud, frowning upon the city; until after the death of Mr. Ross, his curious collection of antiquities was scattered, and the ground feued for building.

NOT WITHOUT THORNS.*

WE are bound to take a woman's estimate of her own sex as worth something in the way of portraiture. It is to be presumed that she understands a little of what she is talking about,

* *Not Without Thorns.* A Story. By Ennis Graham. Author of "She was Young and He was Old." 3 vols. London: Tinsley Brothers. 1873.

and that evolution from her internal consciousness has less to do with the subject than her positive knowledge and sympathetic experience. If a woman paints other women as fast or worldly, mannish or pedantic, sentimental or man-hating, we must believe that she has had models for her outlines; and that in the intimacy of the drawing-room and the boudoir she has learnt more of her sisters than can ever be vouchsafed to piratical man. Also we must believe that her nice women are really her ideals, and that she offers them as specimens of the best she thinks of her sex. We take, then, the female characters in *Not Without Thorns* as the author's deliberate presentations of bad and good women according to her ideas; and from them we learn something of the kind of person which seems to a sister amiable or unamiable, loveable or detestable.

Eugenia Laurence, the heroine, is one of those distracting creatures for whom blame is too hard and patience impossible. She is full of spiritual aspirations and uneasy sensitiveness; alternately swayed by the most pathetic virtues and the most egregious folly; thus offering the portrait of a sweet young person endowed with rare beauty and scant sense, big eyes and small wisdom. Beauchamp Chancellor, her husband, is the ordinary selfish and shallow man; but we do really think he is sufficiently tried by his lovely companion, and her untiring vagaries of feeling, to be exonerated from blame if he is at times irritated by her persistent state of moral porcupinehood, and fretted at the daily need of living with her, as he says, as if "treading on eggshells." An egg-sholl wife is a nuisance, however pretty and affectionate she may be; and the best of good fellows would find her so after a while. Eugenia is very pretty, and she looks specially pretty when her big eyes become dewy with rising tears. So Beauchamp Chancellor says in the beginning, and hastens to kiss them away with fond words and consoling assurances, and all the rest of the tender jargon befitting the first days of the love time. But a husband is not a lover; and a husband gets tired of the tears, when too often repeated, which the lover kissed away so rapturously. A young wife who cries on the smallest provocation, who has no natural surface cheerfulness to temper the cloying oppressiveness of her clinging fondness, who is always either worshipping or weeping, in a state of exaltation or a state of collapse, and who never can be brought to take a calm and rational view of life, is likely to make an easy-going, conventional, shallow-natured man impatient beyond good breeding. We do not wonder then that Beauchamp finds it impossible to restrain the petulant annoyance which would be only too natural under the conditions, and that Eugenia in consequence, sinking from disappointment to despair, should make herself as miserable as if she had rational cause for misery, and act like a maniac because she could not live like one of the blessed.

We lay stress on this character-painting of young wives in ladies' novels, for in it we see that tone of mind in the sex which is the cause of half the unhappy marriages afloat—those marriages which begin well and end ill, no one exactly knows how or why. So long as women think that marriage means only courtship consolidated and uninterrupted, and that it should mean this and nothing else, and so long as they are unable to enter into the prosaic arrangements of companionable friendliness, they must perforce be unhappy, even in those rare instances where they meet with a man as soft and sickly as themselves. For then the chances are that they will wish he was a little rougher, and did not hang about them so incessantly, watching every turn and look with such jealous solicitude as to be quite embarrassing and fatiguing. In the case of those women who sin against themselves, their husbands, and common sense by their own over-sensitiveness, we think the more experienced of their sex, and notably authors, should try to show them the mistake they make, and teach them a more self-respecting code and creed. Human nature does not live at high pressure for more than a few hours at most; and women who brood over love as the only thing in life, and courtship as the only form of love, run great chance of losing the very affections which they desire so passionately to keep always at boiling point. Like children who dig up their seeds to make sure that they are growing and in good condition, they spoil both the work of nature and their own chances. For this cause, *Not Without Thorns* is a book worthy of notice; though as a work of art it is scarcely satisfactory, while as a study of life it is weak and by no means loftily planned.

The character of Eugenia, the heroine, fails to interest us. She is, as we have said, sweet to sickliness, ideal to unreality. We long for just the saving pinch of common sense in her nature which would redeem her from her overwhelming morbidness, and give her what the Easterns term "salt." From first to last she is no more real than a pantomime fairy or a Pepper's ghost. Her very love is more silly than pathetic, even though she does lose her health in the struggle. But why has she so little self-control? We have heard that certain susceptible girls are given to falling in love at first sight, and that weak hearts may be won at a sitting by handsome men experienced in the ways of life and the art of love-making. We have not hitherto believed that these flowers of quick growth have deep roots; on the contrary, we imagined that the girl who let herself fall in love at first sight with A. would do the same by B. at the next opportunity, her affections being evidently not the result of choice, but of simple instinct more or less disguised. Eugenia Laurence, however, is not of this roving kind. "Wax to receive, marble to retain," she knows nothing about the "succession of crops" of which the hearts of most susceptible young ladies bear record. She plunges once and for all time into the bitter-sweet waters of passion for Beauchamp Chancellor; and, prepared as she is by her first act of self-surrender, because he dances with her once or twice and speaks to her kindly at a private party, she sinks only deeper and deeper until she gets nearly smothered before the end. Captain Chancellor, the Magnus Apollo of whom she becomes so passionately enamoured and on such small provocation, is one of those men whom women find irresistible. Handsome, gallant, shallow, making love and feeling none, flirting with every pretty woman who would flirt with him, but really caring only for Roma Eyrecourt, who does not care for him, he is essentially one of the wolves of society, a man marked dangerous, and of whom young lady lambs would do well to beware. He is a good fellow, however, in a way; and when he sees poor Eugenia pale, thin, and half-dying for his sake, he takes compassion on her, and, impelled partly by pity, partly by pique at Roma's unceremonious refusal of his hand, folds the pretty little love-sick maiden to his heart, and makes her blest in a fool's paradise of the most charming appearance. As Eugenia is excessively simple, and by no means rich, and as he is fastidious, worldly, and also by no means rich, their engagement is received with a chorus of disapprobation from his friends; his sister, Gertrude Eyrecourt, leading the choir. This Gertrude Eyrecourt is a perplexingly mixed character, as is also her husband's sister Roma. She is shown us as kind, selfish, insincere, affectionate, good-hearted, spiteful, clever, far-sighted, yet unintentionally lighting up such a fire by her indiscreet confidences as threatens to burn down the whole fabric of her brother Beauchamp's happiness. The reader must reconcile these opposing qualities in the best way he can. It was certainly quite natural that she should not like her brother's marriage with Eugenia Laurence. Clever and ambitious as she is, she is bound by the laws of her own nature to look askance on all the "wildflower" tribe, and to have preferred that Beauchamp should have chosen a wife with more money in the first instance, and, when his own fortune grew to be so lustrous, with more style and *savoir faire* than was possible in a little girl brought up in home seclusion, and given to ready tears and inconvenient demonstrations. But, being clever, she would also have accepted the inevitable, and have sought to make the best of it. Only weak and silly, as well as spiteful, women try to make the worst of an undesirable marriage when it is fairly accomplished, and their own self-respect is not involved in keeping themselves distinct, and perhaps trying to create a rupture which shall withdraw their male relative from bonds which, though legal, are not honourable. There was nothing of this here. Eugenia was silly, but she was good; and though not the kind of wife Gertrude would have chosen for her brother, yet she was a gentlewoman, and did not disgrace him. Hence Gertrude's childish dislike of the girl, and her pettish endeavours to estrange her brother from her, read sadly out of harmony with the main lines of her character; and we wish that the author had reconsidered this part of her work, and stuck more stoutly to her original idea of a sensible and far-sighted woman of the world. No one can be either sensible or far-sighted who does not consent to accept things as they are, and to make the best of the irremediable.

Roma Eyrecourt, too, is slightly hazy in her presentment. At first she seems to be simply selfish, hard, and worldly; but as time and the story go on she develops into one of the noblest and most beautiful of women. She and Sydney, Eugenia's sister, practical and sensible Sydney, a little atone for Mrs. Beauchamp Chancellor's sickliness; but we do not like Roma's love scene with Gerald Thornton; nor do we think that she too would have committed the folly of falling in love at sight, which she evidently does, though in a more restrained way than Eugenia. We are glad, however, that the book ends happily. It was more than might have been expected with the characters on hand. But, all the same, the *motif* is weak, and the keynote does not sound true; and on the whole we cannot say that *Not without Thorns* is any advance on *She was Young and He was Old* by the same author. We own to an infinite contempt for twaddle, both of speech and of sentiment; and *Not Without Thorns* is by no means free from a suspicion of twaddle and more than a dash of silliness both in the characters and the story.

FRENCH LITERATURE.

M. VILLEMAIN'S History of Pope Gregory VII.* has been announced for nearly half a century; it was begun during the last years of the Restoration, and the author was about to publish it by subscription when the political events of the day led him to reconsider his original plan. We need not say what was the attitude assumed towards the Bourbon Government, or rather towards the Villèle Cabinet, by MM. de Lacretelle, Cousin, Guizot, and Villemain; the liberal views strenuously and eloquently maintained in the Sorbonne lecture-room by those eminent men caused them to be superseded in their office, and it was only when Martignac was called to the head of affairs that the four champions of constitutional freedom were allowed to resume the position they had so ably occupied. Under these circumstances the publication of the *Histoire de Grégoire VII.* had to be delayed, and M. Villemain took advantage of the new

* *Histoire de Grégoire VII.* Par M. Villemain. Paris: Didier.

duties imposed upon him to revise, correct, and almost to recast the work which he always considered as his *monumentum ære perennius*. It now appears as a posthumous production, and although it can never obtain the success which the *Tableau de la littérature* enjoyed from the very first, still it will be regarded as an interesting work, displaying not only great brilliancy of style, but real erudition. M. Villemain's language is his strong point, though we must add that the polish of his sentences, their harmony, and their colouring weary us after a very brief acquaintance with any of his works. "C'est un style de décadence," as a distinguished critic once remarked to us. Of the book itself we will only say at present that the first chapter is devoted to an introductory account of the Papacy from the earliest time to the eleventh century.

M. Georges Perrot, Professor at the French École normale, is favourably known by several works, chiefly on Greek history and archæology. He wrote some years ago an amusing account of the island of Crete, and contributed to the history of jurisprudence a very valuable monograph on Athenian law. The volume now before us* may be looked upon as a sequel to this last-mentioned treatise, and in unfolding before us the splendid annals of political and judicial eloquence at Athens M. Perrot has taken for his text the saying of Cicero—"Studium eloquentiæ proprium Athenarum." By way of introducing the subject, he begins by showing how a passion for public speaking ever formed one of the leading characteristics of the Greek race. Even in the days of Homer muscular vigour and courage on the battle-field were not the only qualities looked for in men who had to take the lead amongst their fellow-citizens; eloquence was also indispensable, and Ulysses was at least as necessary to the Greek army as Achilles himself. M. Perrot goes on to describe in a general manner the eloquence of writers who were not professedly public speakers; he notes, for instance, how Herodotus and Thucydides helped on the progress of oratory, and he endeavours to ascertain from the best authenticated sources how Pericles understood the great art of addressing popular assemblies. The work itself consists of seven chapters, respectively devoted to Gorgias and the Sophists, Antipho, Andocides, Lysias, Isocrates, and Isæus.

André Chénier †, for the majority of readers, is only a poet—one of the most distinguished perhaps of the revolutionary era, but hardly anything else. The elegy so well known by the name of the *Jeune Captive*, which he composed for Mdlle. de Coigny, and the *Iambes* which he dashed off on the way from prison to the scaffold, are the only productions of his pen familiar to all but the few persons who have studied the history of journalism during the first period of the French Revolution. We have no hesitation in saying, however, that he was at least equally remarkable as a prose writer, and the volume now before us will, we doubt not, contribute to raise him in the opinion of competent judges. M. Becq de Fouquières is not the first critic who has published the political writings of André Chénier, but he is certainly the only one hitherto who has given them correctly and in a methodical order. The preliminary essay on the gifted author, considered as a politician, is quite exhaustive. M. de Fouquières has supplemented it by the insertion of Palisot's biographical notice and of a number of illustrative documents. With reference to the well-known accusation cast against Marie-Joseph Chénier by Royalist newspaper writers, M. de Fouquières shows that it was a gross calumny. It is absolutely untrue that Marie-Joseph sent his brother to the guillotine; but "if he committed no crime," says M. Roederer, "he professed all the bad principles which lead to the commission of crime; he did not murder his brother, but he was the friend of the murderer." A table and an alphabetical index terminate the volume.

Next to André Chénier let us place another writer belonging to the same epoch, and deserving to be better known than he is at present. The Chevalier de Pange ‡ is often mentioned in Chénier's works; he was his intimate friend, and shared his political opinions; but until quite recently it was impossible to form any idea of his merits as an author, except by diving into the endless collection of *brochures* on political subjects issued at the beginning of the French Revolution. Pamphlets written in 1789 and 1790, articles contributed in 1790 to the *Journal de la société de* 1789, in 1792 to the *Journal de Paris*, and in 1795 and 1796 to the *Nouvelles nationales, politiques et étrangères*—such is the addition made by the Chevalier de Pange to the polemical literature of his time. Our thanks are due to M. Becq de Fouquières for enabling us to become acquainted with a really distinguished representative of French journalism. André Chénier's friend died at an early age, but he left enough behind him to establish his fame as a moralist, and his reflections on mankind and society are the more striking because they were the result of political strife, instead of being quietly elaborated in seclusion and retirement.

M. Laboulaye's *Questions constitutionnelles* § now appear together in a compact and handy little volume, after having been published separately, as circumstances suggested, from time to time. The author remarks, with a certain excusable tone of bitterness, that hints thrown out and advice given in 1848 and 1851 bear repetition even now, when once more the French political edifice has to be reconstructed from top to bottom. He likens his fellow-citizens to horses which, galloping round a circus, seem to be advancing, whilst they are merely retracing their steps. At the end of every term of twenty years the building falls to the ground, and the same work has to be done over again which appeared to be completed twenty years before. M. Laboulaye tries to show that the origin of this deplorable state of things must be sought in the confusion existing in the minds of most people between the idea of liberty and that of revolution. Such being the case, it is certainly not to be wondered at that, on the one hand, monarchists should shrink when they hear the word "freedom" pronounced, whilst, on the other hand, ultra-Republicans are in a rage if any one talks to them about the power of the law, or hints respectfully something about political guarantees. M. Laboulaye aptly designates our modern demagogues as the Ultramontanists of the Revolution, and he has no difficulty in proving that the believers in the infallibility of Robespierre and Babeuf have done all they could to ruin the cause of true liberty.

Educational questions are quite as much the order of the day on the other side of the Channel as they are amongst us, and M. Jules Simon's circular is only the most recent manifestation of a change which must sooner or later take place. Before the old system has been swept away M. de Laprade steps forward ‖ to defend classical studies against the pretensions of positivist innovators. The two points on which he specially insists are the exaggerated merits ascribed to scientific education, and the undue importance, as he thinks, given to the reforms bearing upon primary education. With reference to this latter topic, M. de Laprade believes that, if elementary teaching requires such sweeping modifications, it is simply because superior education is radically bad. One of his chief objections against the French educationists of the so-called liberal school is that they look upon children as the property of the State, and thus aim at destroying family influence. It was Rousseau and his disciples who first popularized this idea, and the sooner it is done away with the better. As M. de Laprade observes, it is a great cause for regret that the men who talk most in France about education are stump orators totally destitute of intellectual culture, and having nothing but immorality, ignorance, and impudence to recommend them.

L'esprit public au XVIII^e siècle †† is an attractive title. If any epoch in the history of France has been especially rich in bold manifestations of public opinion, it was certainly the eighteenth century, when reforms of the most various kinds were openly preached, and the scandalous corruption of a weak though absolute Government was freely discussed. Public opinion found expression not only in the *Encyclopédie*, and the works of Voltaire, Rousseau, Diderot, Montesquieu, and Raynal, but in memoirs such as those of D'Argenson and Barbier, in newspapers, and in letters which, written exclusively for private perusal, were still more explicit than memoirs, and displayed a far greater freedom. M. Aubertin has aimed at describing, in this new volume, the state of public opinion in France on all sorts of questions from 1715 to 1789. The book is divided into four parts, corresponding to the Regency of the Duke of Orleans, the reign of Louis XV. till the Seven Years' War, the epoch extending from the battle of Rosbach to the accession of Louis XVI.; and, finally, the reign of that unfortunate monarch. The reader will find in this very interesting volume a number of curious details respecting Mathieu Marais, Madame Campan, Barbier, and also several memoirs and letters which are still unpublished.

The eighth series of M. de Pontmartin's *Nouveaux samedis* ‡‡ bears that militant stamp which characterizes all works composed during the late war; for, although the duodecimo now on our table bears the date of the present year, it consists of newspaper articles originally written in 1871 and 1872. M. de Pontmartin has had the boldness, some people would say the audacity, to expose the literary and political demerits of M. Victor Hugo, and for having done so he found himself roundly abused by the Republican press. In the eyes of our ardent revolutionists the *Année terrible* is the great work of modern times, and it is quite clear that those who do not acknowledge its transcendent beauty would fare very ill if the champions of democracy were in power. The critic of the *Nouveaux samedis*, it seems, has been served with threatening letters just like an Irish landlord who has ejected his tenants.

Count de Beauvoir §§ has already earned a reputation as one of the most accomplished of modern French tourists, and the new edition of his travels is sure to meet with a welcome from all readers. The maps and woodcuts which illustrate it are excellent, and add much to the usefulness of the volume.

Amongst the scientific works lately published by Messrs. Hachette, M. Delérain's treatise on agricultural chemistry must occupy a prominent place. ‖‖ It is to a certain extent a summary of lectures delivered by the author to the pupils of the Grignon School, where he had been appointed Professor ten years ago under

the administration of M. Monny de Mornay. The duties of his post obliged him to study the best French and foreign treatises on the questions he had to examine, and, having been requested to act as one of the *collaborateurs* to the Dictionary of Chemistry edited by M. Wurtz, he enjoyed a further opportunity of collecting materials for the volume which he now presents to scientific students. The first part of the book treats of plants and their development; in the second we have a description of arable land, its formation, and its qualities; the third division is given to the improvement of the soil, and the fourth to manure. Woodcuts are added whenever necessary, and the author has constantly aimed at giving to his work that practical character which will make it useful to all persons engaged in agricultural pursuits and in scientific farming.

"Those who have kept a faithful recollection of the events in which they had a share are bound to benefit history with the tribute of their knowledge." Such is the opening sentence of a fresh contribution to the account of the Franco-Prussian War; the title of the book * itself enlightens us sufficiently as to its contents, and Prince Bibesco's relations with General Douay give it almost an official character. The author has aimed at writing a detailed narrative of the operations carried on by the Seventh *Corps d'armée* from Belfort to Sedan. Marshal MacMahon, as it is well known, had to follow out a plan which he by no means approved; he wanted, in the first instance, to retreat towards Paris, and then, as a *pis-aller*, to march towards Mézières. Compelled to adopt the scheme devised by Count Palikao, then Minister of War, he should have done so with rapidity; instead of which he lost a considerable amount of precious time in hesitating, altering his plans, ordering and counter-ordering, until the fatal day of Sedan crushed at once the hopes of France. Prince Bibesco has related in a plain, simple manner the part performed by the Seventh Corps in this disastrous campaign, and the strategic maps drawn for the volume may be profitably consulted.

M. G. Monod's *souvenirs* † add a few interesting facts to those with which we are now all familiar, but they derive their principal value from the comparison which the author draws between the Germans and the French, as far as character, morality, and education are concerned. We need scarcely say that a Frenchman who assigns the superiority to the Teutonic race cannot be expected to meet with much sympathy from his fellow-countrymen. It would be idle, however, to deny that the corruption which has for many years eaten up society in France largely contributed to the issue of the late war. Writers belonging to *la grande nation* are the very first to acknowledge this, and to say with the utmost plainness of speech that no reform is possible so long as conceit, selfishness, and a thorough disregard of the simplest elements of morality are systematically encouraged.

The elegant collection of M. Lemerre's reprints‡ is now enriched by an edition of Beaumarchais's *Mariage de Figaro*. We have already on several occasions stated what we consider to be the true place in French literature of the amusing but unprincipled author of the *Barbier*, and we need not here revert to the subject. Let us, however, note how interesting are the prefaces of Beaumarchais as bearing upon the social life of the last century. When he wrote them he seemed to be still pleading before a court against powerful enemies who, in attacking him, were endeavouring *ipso facto*, so he thought, to put down the spirit of reform. It is amusing to see him compare the freedom which Molière enjoyed under the absolute rule of Louis XIV. with the restrictions which the police of Louis XVI. imposed upon such "harmless" compositions as the *Mariage de Figaro;* but he forgets that the circumstances of the times were entirely different; and, besides, it is very doubtful whether the *Grand Monarque* would have allowed the performance of any play touching, even indirectly, on political subjects.

The last *livraison* of M. Littré's splendid Dictionary is now out §, and thus has been brought to a satisfactory conclusion one of the most gigantic undertakings on record in the annals of lexicography. In taking leave of his readers M. Littré draws attention to the fact that he has collected a large number of materials for a second issue; and he already prints a few additions which suggested themselves at once, together with certain corrections and alterations, the necessity of which had been pointed out to him by his friends. A list of the authorities quoted in the course of the Dictionary, together with references to the best editions of their works and to the MSS. consulted in the case of a few mediæval productions, is also added. We cannot lay down the *Dictionnaire de la langue française* without giving a word of praise to the accuracy with which the printing has been done. In a work of this description, more perhaps than in any other, the utmost correctness is required; and when we say that each proof was read no less than seventy-two times before being struck off, the reader will have some idea both of the expense incurred by the publishers and of the anxiety they felt to produce a thoroughly good work. We would hope now that some competent scholar may be found to prepare for general use an abridged edition of M. Littré's Dictionary. Such a compilation, carefully done, would be of the greatest service to students who cannot afford to purchase the larger one.

M. Alexandre Dumas had always, it appears, intended to write a book on cookery as the *couronnement* of his literary edifice. The volume now comes forth posthumously—a bulky octavo, looking very scientific, very methodical, published in the shape of a dictionary, and illustrated with a portrait of the author. Dictionaries, however, are not all necessarily dry, witness Bayle's; and M. Littré's *chef-d'œuvre*, just noticed, is a great deal more interesting than many a novel. In like manner it might naturally be expected that the *Grand dictionnaire de cuisine* * would contain a good proportion of romance and chit-chat, mixed up with professional details. And such is the fact; nor do we think that any reader will object to such a combination of *utile* and *dulce*. Let M. Jules Gouffé carry off the palm for science, matter of fact, and culinary transcendentalism; M. Alexandre Dumas takes up the imaginative side of the subject, and no one will think the worse of his recipe for cooking *cailles au basilic* because a few pages afterwards they will find a song or an anecdote.

The title given by Madame Guerrier de Haupt to her collection of novelettes † shows sufficiently in what spirit they are written; we can recommend them as wholesome and sound reading. M. Chavette is also an author whose tales may be safely left on a drawing-room table. *Défunt Brichet* ‡ will be sure to please persons fond of adventure *à la Monte-Christo;* it teems with melodramatic incidents, impossible catastrophes, miraculous episodes, and affects a kind of semi-historical character by the appearance of Louis XIV., the Duke de Vivonne, Madame de Montespan, and other celebrities of the seventeenth century.

THE SOCIETY of PAINTERS in WATER-COLOURS.—The ELEVENTH WINTER EXHIBITION of SKETCHES and STUDIES is NOW OPEN, 5 Pall Mall East. Ten till Five. Admission, 1s.
ALFRED D. FRIPP, *Secretary.*

DORÉ'S GREAT PICTURE of "CHRIST LEAVING the PRÆTORIUM," with "Triumph of Christianity," "Christian Martyrs," "Francesca da Rimini," "Nerghyle," "Titania," &c., at the DORÉ GALLERY, 35 New Bond Street. Ten to Six. Admission, 1s.

THE TICHBORNE DEFENCE FUND.

Trustees.

The Right Hon. Lord RIVERS.
GUILDFORD ONSLOW, Esq., M.P.
ALBAN ATWOOD, Esq., M.D.

In consequence of the Judgments pronounced in the Court of Queen's Bench for contempts of Court committed by Mr. Guildford Onslow, M.P., Mr. Whalley, M.P., Mr. Skipworth, and the Claimant, the British public can now only be appealed to for Funds by circular and advertisement. The Gentlemen whose names appear above have consented to act as Trustees of moneys which may be forwarded, and will guarantee that they are appropriated solely for the purposes of the defence.

Let not the Claimant be found guilty without allowing him the opportunity of proving his innocence. That opportunity lovers of fair play can now give him.

If desired, the names of the Donors will not be disclosed.

N.B.—It is specially desired to be distinctly understood that no Subscriptions of whatever amounts will be received as expressions of the opinions of the Donors for or against the Claimant, but simply and solely as a means of enabling him to cope in some measure with the distinguished leaders of the English Bar arrayed against him, instructed as they are by the Solicitor to the Treasury and at the public expense.

(Signed) GUILDFORD ONSLOW, M.P.
On behalf of the Trustees.

TICHBORNE DEFENCE FUND,
Offices: 376, Strand, W.C.

Post Office Orders and Stamps to the Office, 376 Strand, W.C.; Cheques to Messrs. HOARE, FANSHAWE, & Co., 16 St. James's Street, S.W.

CHELTENHAM COLLEGE.—TWELVE SCHOLARSHIPS. Two, £50; Six, £40; Four, £30. Election, Second week in May.—Apply to the SECRETARY, The College, Cheltenham.

CLIFTON COLLEGE.—SCHOLARSHIPS.—The following will be open to Competition at Midsummer next: 1. One or more Entrance Scholarships of the Value of £50 a year during the holder's stay at the College. 2. The Guthrie Scholarship of £70 a year for Two Years, for Boys under Seventeen. 3. One or more of £25 a year for Two Years, or till election to another Scholarship, for Boys under Sixteen. 4. One or more of £25 a year for Two Years, or till election to another Scholarship, for Boys under Fifteen. An allowance for age is made in favour of Young Boys for Nos. 1 and 3.—Further information may be obtained of the HEAD-MASTER or SECRETARY, The College, Clifton, Bristol.
The College, Clifton, January 16, 1873.

TRINITY COLLEGE, Glenalmond, Perth, N.B.
Warden—Rev. R. THORNTON, D.D. Oxon.
A School on the model of the greater Public Schools of England. Terms (including every necessary expense), 80 and 90 Guineas, according to age. There is also a Theological Department, for Candidates for Holy Orders. Particulars may be obtained from THE WARDEN.

LADIES' SCHOOL, Mary Street House, TAUNTON, for the Daughters of Clergymen, Professional Men, and Gentlemen.—The Education given is a thoroughly sound one, and the assistance of experienced Masters is procured in the study of those branches of learning which are generally neglected in the education of Ladies. The real work done is tested by the College of Preceptors and the Oxford Local Examinations, and by examinations carefully conducted in the School itself. Four Pupils passed the Senior Oxford Local Examination and Two the Junior, in June last. And at the Christmas Examination of the College of Preceptors, Eight Third Class, Five Second Class, and Three First Class Certificates, including special and Honour Certificates, and the College First Prize for English subjects, were gained by the Pupils. Inclusive terms do not exceed 50 Guineas per annum.—Full particulars will be forwarded on application to the LADY-PRINCIPAL. The highest references given.

EDUCATION at ZÜRICH, Switzerland.—M. F. de BAUDISS, recently Assistant-Master at Wellington College, receives a limited number of PUPILS, and has now a FEW VACANCIES. M. de Baudiss's Pupils, besides receiving instruction in French, German, and English subjects, have the opportunity of working with an excellent Mathematical Tutor, and of attending the Lectures of the Polytechnic School, on Practical Mechanics, Engineering, Chemistry, and other technical subjects (without extra charge).—Terms, references, and particulars may be had on application to M. F. DE BAUDISS, Stadthalter, Seefeld, Zürich.

BOARDING SCHOOL, Seeheim, near Constance, Baden.—Classical Studies. Preparation for Commercial, Naval, and Military Schools. Limited number of Pupils. Terms, £60 sterling a year. Parents are respectfully referred to Rev. Hahn, Doctor of Theology, Stuttgart (Heslach); Ph. Paulus, Ust. Olgastr. 4 Stuttgart; or to the Principal, PH. BUTTER.

PHYSICAL EDUCATION.—Advertiser is desirous of being supplied with a series of short ARTICLES on the above subject.—For further particulars apply to MUSCULAR, care of Messrs. Dawson & Sons, Cannon Street, City, London.

HYDROPATHY.—SUDBROOK PARK, Richmond Hill. *Physician*—Dr. EDWARD LANE, M.A., M.D. Edin. Turkish Baths. Consultations daily (Saturday excepted) at 7 Princes Street, Hanover Square, from Ten till Twelve.

INDIAN PARCEL POST.
Commencing on FEBRUARY 1.
Under Authority from the POSTMASTER-GENERAL of INDIA.
Parcels not exceeding fifty pounds in weight and 2 ft. × 1 ft. × 1 ft. in size, and £20 in value, are conveyed by the PENINSULAR AND ORIENTAL COMPANY from London to any Post Town in India at a uniform charge of 1s. 6d. per lb. Full Particulars on application at
122 LEADENHALL STREET, E.C.

BRIGHTON.—BEDFORD HOTEL.—Every endeavour is made to render this Hotel equal to its long-existing repute. Spacious Coffee Room for Ladies and Gentlemen. Sea-Water Service in the Hotel.—Communications to The MANAGER, Bedford Hotel Company, Limited.

CAUTION.—The "NEW CHARTA PERFECTA COURT NOTE PAPER" ... ared.—The Public are respectfully cautioned that the "NEW COURT NOTE PAPER" ... sed by the Royal Family is to be had only of JENNER & KNEWSTUB, Heraldic Engravers, Stationers, &c., by Special Appointments to their Royal Highnesses the Prince and Princess of Wales, 33 St. James's Street, and 66 Jermyn Street, S.W.

WHAT WILL this COST to PRINT?—A Packet containing Information for Authors may be obtained on application to
R. BARRETT & SONS, 13 MARK LANE, LONDON.

CLERICAL, MEDICAL, and GENERAL LIFE ASSURANCE SOCIETY.
Established 1824.

Directors.

Chairman—The Right Hon. JOHN ROBERT MOWBRAY, M.P., D.C.L.

Deputy-Chairmen.

Actuary and Secretary—GEORGE CUTCLIFFE, Esq.
Assistant Actuary—BENJAMIN NEWBATT, Esq.

FINANCIAL RESULTS.

The Annual Income, steadily increasing, exceeds £307,000
The Assurance Fund, safely invested, is over £1,810,000
The New Policies in the last year were 515, assuring £276,710
The New Annual Premiums were £9,851
The Total Claims by Death paid amount to £3,090,000
The Subsisting Assurances and Bonuses amount to £5,765,000

DISTINCTIVE FEATURES.

CREDIT SYSTEM.—On any Policy for the whole duration of a healthy Life, where the age does not exceed 60, one half of the Annual Premiums during the first five years may remain on credit.

ENDOWMENT ASSURANCES may be effected, without Profits, by which the Sum Assured becomes payable on the attainment of a specified age, or at death, whichever event shall first happen.

INVALID LIVES may be assured at rates proportioned to the increased risk.

PROMPT SETTLEMENT OF CLAIMS.—Claims paid thirty days after proof of death.

BONUS.

The Reversionary Bonus at the Quinquennial Division in January, 1872 (amounting to £323,871) averaged 40 per Cent., and the Cash Bonus 20 per Cent. on the Premiums paid in the five years.

The next Division of Profits will take place in January, 1877, and Persons who effect New Policies before the end of June next will be entitled at that Division to one year's additional share of Profits over later Entrants.

REPORT, 1872.

The Annual Report just issued, and the Balance Sheets for the year ending June 30, 1872, as rendered to the Board of Trade, can be obtained of any of the Society's Agents, or of

GEORGE CUTCLIFFE, *Actuary and Secretary,*

THE

SATURDAY REVIEW

OF

POLITICS, LITERATURE, SCIENCE, AND ART.

No. 902, Vol. 35. February 8, 1873. [Registered for Transmission abroad.] Price 6d.

THE QUEEN'S SPEECH AND THE GENEVA AWARD.

THE QUEEN'S Speech might have been written beforehand by any person who had paid ordinary attention to current political events; and three persons out of four would have expressed their meaning better. When Mr. GLADSTONE disclaimed any intention of singing a paan in celebration of the Geneva Award, he might have confirmed his assertion by a reference to language which could not have found place in the libretto of any triumphant dithyrambic. It is strange that accomplished and scholastic statesmen should, year after year, ascribe to the QUEEN phraseology which might be pardoned if it were composed by a washerwoman. One of the strophes of Mr. GLADSTONE'S alleged paan is to the effect that acknowledgments are due to the German EMPEROR, who on this occasion is happily not mis-described as Emperor of GERMANY, and to the Geneva Arbitrators, for "the care bestowed "by them on the peaceful adjustment of controversies such as "could not but impede the full prevalence of national goodwill "in a case where it was especially to be cherished." It is not a defect in a QUEEN'S Speech that it should contain nothing new; but the course of the debate was altogether unexpected. Lord GRANVILLE indeed gave an explanation of the Russian negotiations which will afford general satisfaction, although it appears that Russia and England are not wholly agreed on the proposed line of demarcation. It would seem that in this case there is for the present nothing "to impede the full prevalence of "national goodwill," though Mr. DISRAELI'S invitation to the Russian Government to extend its inland dominions to the waters from which it is excluded may perhaps be misunderstood. There are no waters in Central Asia except the Caspian and the Sea of Aral, and both basins are already in possession of Russia. There is no reason to question the judgment which Lord GRANVILLE has displayed in the negotiation, as far as the course of transactions is at present known. The remainder of the Speech scarcely raised any discussion in either House, after the movers and seconders had displayed in the discharge of their functions unusual ability and promise. The Duke of RICHMOND justly censured various imprudent speeches which have been delivered during the recess; but on the whole Mr. DISRAELI'S contemptuous sneer at village agitators was more effective than any detailed comment. If one or two of the agitators happened also to be Cabinet Ministers, they will now have learned that Mr. DISRAELI had for the moment forgotten their exalted position.

Although Parliament has plenty of work before it, it was pleased on the first night of the Session to occupy itself almost exclusively with a matter which has passed beyond its control. As the House of Commons will be required to provide money for the payment of the *Alabama* damages, it was proper that the result of the Arbitration should be noticed in the Speech; nor can any reasonable objection be raised to the substance of the paragraphs which in style exceed the ordinary license of slipshod composition. It is remarkable that no reference was made in the debate to one of the most seasonable statements in the Speech. As the American PRESIDENT asserted in his Message to Congress that the Arbitrators had, in accordance with the wish of the United States, given their decision on the Indirect Claims, the English Ministers properly record the fact that their COURT "was enabled to prosecute the inquiry in consequence "of the exclusion of the Indirect Claims." There is no difference of opinion as to the propriety of the conduct of the Government in having evacuated the island of San Juan as soon as the German Emperor had delivered his award. The discussion which followed was long and animated, and scarcely in accordance with Parliamentary traditions. It has been generally supposed that controversies in which no practical result can be attained ought to be pursued in less authoritative Assemblies. The provisions of the Treaty have been put in operation, the Arbitration is at an end; and yet Lord DERBY, Lord SALISBURY, and Lord CAIRNS, Mr. DISRAELI, and Mr. HORSMAN, and a host of other speakers, denounced the real and supposed miscarriages of the Government and the Washington Commissioners as earnestly as if the adoption or rejection of the Treaty were about to be submitted to Parliament. Mr. BERNAL OSBORNE'S recommendation that "we "should do no more than pay our money and put our vexa-"tion in our pocket" was the more appropriate because, after all, the advice will necessarily be followed. Mr. OSBORNE himself could not refrain from expressing in the strongest terms the vexation which is nevertheless to be pocketed. In his opinion the Treaty was "unfortunate in its conception, "and more bungling in its conclusion, if possible, than in its "conception"; but on his own showing he might have refrained from uttering useless lamentations. Mr. GLADSTONE afterwards reminded the House that Mr. OSBORNE had a year ago censured the Government for not voluntarily paying 6,000,000*l.* as damages instead of resorting to arbitration.

The only practical question in the debate was suggested by Mr. DISRAELI. In the Treaty of Washington both Governments covenant not only to abide for the future by the new Rules of international law, but to bring them under the notice of other Powers, and to endeavour to procure their adoption. It was at that time hastily assumed that the Rules themselves would be understood in their obvious meaning; or, rather, the English Commissioners had not anticipated the course which was afterwards pursued in the litigation. The Arbitrators, with the exception of the only competent lawyer in their body, thought fit to interpret the Rules in such a manner as to impose an intolerable burden on neutrals. The English counsel, whose contention was approved by the LORD CHIEF JUSTICE, endeavoured to show the unsoundness of the American arguments, and the impolicy of adopting their conclusions; but the authority of the Tribunal, such as it is, may henceforth be quoted by belligerents in support of the largest pretensions. Mr. DISRAELI properly inquired whether the English Government proposes, in accordance with the Treaty, to recommend to foreign Powers the adoption of the Rules, and, if so, whether the English construction or the Geneva version is to be recommended to their approval. Mr. LOWE'S answer is utterly unsatisfactory when he declares that the Rules will be submitted to foreign Governments without note or comment, so that they may, if they accept them, affix to the text any meaning which may hereafter suit their policy or satisfy their judgment. Such a course might have been adopted before the Arbitration, but now it would be at the same time illusory and discourteous. Diplomatic communications are not made in the curt and technical manner which is implied in Mr. LOWE'S suggestion. If Lord GRANVILLE were to direct his Ambassador at Paris, or Berlin, or St. Petersburg to submit the Rules to the Government to which he was accredited, the question whether the English Government accepted the Geneva interpretation would inevitably be asked, nor could the necessity of an answer be evaded. When it was explained that the Arbitrators had committed a grave error in judgment, and that the English interpretation was expressed in the judgment of the LORD CHIEF JUSTICE, it would be an obvious remark that dubious and disputed rules of international law could not prudently be accepted. It would not be necessary to enter into the collateral squabble between Mr. LOWE and Mr. VERNON HARCOURT as to the more or less judicial attributes of arbitrators in general. Mr. LOWE is right in contending that the power of the arbitrator is limited to the particular case; and Mr. HARCOURT'S statement that the award may be set aside if

it is founded on a legal error, is at the same time too wide and not relevant to the immediate question. The Geneva Arbitrators were not content with awarding large damages, for they also explained the principles on which they supposed the decision to rest. Any Government which might be invited to accept the new Rules could not but be aware that in the only case to which they had been applied they had given rise to a grave difference of opinion, and to conclusions which are at least serious if not startling. England is, as Mr. Lowe truly declared at Glasgow, not bound in future to admit the validity of the gloss which was affixed by the Arbitrators to the Rules, but a similar result might perhaps follow from another litigation; and, on the other hand, the English Government could not as a belligerent consistently demand from a neutral concessions which it had in its own case resisted throughout the controversy. It seems impossible that the course to be pursued can be settled without further Parliamentary discussion. Mr. Gladstone's suggestion that there should be, if possible, an understanding with the American Government, will be futile in the highly probable case of a claim on the part of the United States, that the reasons as well as the results of the Geneva Award shall be admitted as binding and conclusive. The best mode of solving the difficulty would be to obtain the consent of the American Government to defer for an indefinite time the embarrassing communications required by the terms of the Treaty. It will be well if the elaborate debates of the first night of the Session are held to have exhausted the subject. Local taxation and land tenure will perhaps be found, if not more attractive, at least more pressing subjects of discussion. Nearly all the arguments against the Treaty and the Arbitration which were used in either House had long since been anticipated by writers who will now be better employed in dealing with projects of legislation than in reviving unsatisfactory reminiscences.

PROSPECTS OF THE SESSION.

THE Queen's Speech consisted, as Mr. Disraeli observed, of fifteen paragraphs, ten devoted to foreign and five to home matters. In the first division Central Asia and the Geneva Arbitration supplied topics of real interest, and secured full attention in the debate; while as to Zanzibar there was little to be said except what was said by Lord Derby, that he admired the objects of the mission of Sir Bartle Frere, but hoped it would not lead us into too great expense. Nor, as the details of the French Treaty are still unknown, is it possible to do more than to echo the wishes rather than the expectations of the Opposition speakers, that it may be found, in the words of the Speech, to rest on a reciprocal and equal basis. The mention of the Belgian Extradition Treaty elicited from Mr. Gladstone the satisfactory information that negotiations are being carried on for a similar Treaty with Spain, the story of the *Murillo* having drawn attention to the fact well known, especially in commercial circles, that Spain is the happy hunting-ground of English criminals, and especially of English fraudulent debtors. The paragraph describing the state of the country was criticized by Lord Derby as too rose-coloured, and it is quite true that there are elements of uncertainty in the future of English production which are enough to create grave anxiety; but still it is not going very far to say that the condition of the three kingdoms in regard to trade, pauperism, and crime may be pronounced generally satisfactory. At the same time the Speech informs us that the rise of prices will tell on the Estimates, although consumers of coal will be glad to learn, on the authority of the Cabinet, that the recent variations of price are of an exceptional nature. The list of measures to be introduced by the Government this Session had nothing in it to surprise any one, unless it were considered as significant of some change of purpose in the Ministry that the modifications which it is intended to introduce into the Education Act should be thought of sufficient importance to need notice in the Queen's Speech. The great effort of legal reform will be the creation of a Supreme Court of Judicature. This is a task of immense magnitude and difficulty, for it will determine for long years, and perhaps for centuries, the course which English law is henceforth to take. It is to be observed that the question of appeals is treated as subsidiary to the question of the constitution of a Supreme Court; and this shows that Lord Selborne is determined to work in a very different path from that of his predecessor. Not only is he a stronger man as a politician and as a lawyer, but the time is more favourable to him, and he has the advantage of Lord Hatherley's failures. Experience has shown that it is impossible to found a new Court of Appeal when the change stands by itself; for if the constitution of all other Courts is assumed to be satisfactory, the proposal for a new Court of Appeal practically degenerates into a discussion as to the efficiency with which the Law Lords perform their duties; and as the Lords decide the fate of the proposal, and the Law Lords guide the Lords, debates always end in the Law Lords voting that they do their duty to perfection. Lord Selborne has thus learnt that he has not much to lose by going much further, and trying to remodel the whole system of English judicature; for it is obvious that the proposal to establish a new Supreme Court involves the consideration of what is to be the relative position of all inferior Courts. The proposal also raises subsidiary questions of a very wide nature, questions on which there is much difference of opinion and much keen feeling, such as the advisableness of fusing Law and Equity, having one uniform system of civil procedure, and dividing the Bar into metropolitan and local sections. So many critics will be interested, so many opponents will be at once secret and bitter, so vigorous will be the open opposition, and so utterly uninformed is the public as to the merits of the question to be decided, that it may be safely said that, if in this Session Lord Selborne can carry the establishment of the Supreme Court, he can carry anything he pleases in the way of Law Reform.

The Irish Education Bill is to be the great measure of the Session. As Mr. Disraeli said, it has a paragraph all to itself, and every one knows what that means. This paragraph is framed in very unexceptionable language, for it announces that the object of the Bill will be at once to promote sound learning and to respect the rights of conscience. How this is to be done is a secret which the Government has preserved with judicious jealousy. All the speakers who in either House moved and seconded the Address touched on the subject, and it may be remarked that all the speeches of these four unknown speakers were good, while that of Mr. Stone rose to an unusual degree of [illegible]. Something also was said on the subject by subsequent speakers with whose names the public is more familiar, and Lord Dufferin, Mr. Disraeli, and Mr. Gladstone remarks which were not without significance. The general result of their remarks may be said to be that the difficulty of carrying a Bill which shall at once uphold sound learning and respect the rights of conscience are enormous, but that both parties are interested in seeing it carried, if possible. That the Ultramontane party should get what they want is entirely out of the question. It is not merely that they would, of course, like to get some form of concurrent endowment. They have not the slightest chance of getting it, and they know this, and may perhaps be content not to cry for the moon. But, as Lord Montagle justly observed, the State, in determining to promote sound learning, has virtually to decide what sound learning is, and the opinions of the Irish Ultramontane and the English Protestant are diametrically opposed on the question as to what sound learning means. The Ultramontane means by it learning which is in harmony with the teachings of his Church; the English Protestant means by it learning that embodies and promotes free, active, and serious thought. Half of the books which educated Englishmen habitually refer to as their standing intellectual food are on the Index, and to the Ultramontane mind time spent in studying them is time wasted or misspent in studying the writings of wicked or erring men. Mr. Disraeli also took occasion to foreshadow the action of his party on another of the standing difficulties of the subject when he said that he trusted that a famous University would not be sacrificed to the mechanical mediocrity of a Board of Examiners. If a number of calm, fair, and educated men, equally free from bigotry and from a cowardly fear of the priests, were to meet to frame an Irish Education Bill, they would find it exceedingly difficult to arrive at an agreement or opinion that would lead to a Bill really adapted to the exigencies of the case; but when we add to the inherent difficulty of the subject the difficulty of combating the fierce prejudices of thousands of ignorant fanatics on both sides of the Channel, we are not far from the state of mind in which Lord Derby was when he avowed his opinion that no satisfactory Bill on Irish education was possible. On the other hand, the Conservative party is as a party very much interested in not taking office with this vexed question remaining as an open sore. As Mr. Gladstone candidly observed, both he and Mr. Disraeli had already burnt their fingers with Irish education, and neither could wish to burn them again. The opponents of the Government are therefore sure to let the Bill pass if they possibly can do so without alienating their adherents, and

this is the strongest ground for hope that the Government possesses.

The controversy on the Irish Education Bill is sure to be so protracted and so warm that Mr. STONE hinted a doubt whether there would be time for anything else, and especially for the discussion of so intricate a subject as Local Taxation. Besides measures on these two main subjects to be introduced in the Lower House, and the Bill for the establishment of a Supreme Court to be introduced in the Lords, the Government suggest, briefly, and with evident apprehension of never reaching them, many minor measures, the nature and extent of which they are so little able to foresee that they vaguely describe them as various other Bills for the improvement of the law. This raises an alarming prospect of boundless legislation, and, as Mr. DISRAELI pointed out, a happy accident prompted the framers of the Speech to proceed at once to make the QUEEN express a hope that Parliament might receive a special blessing to enable it to do its work. It will need a very special blessing if, in addition to doing all that the Government asks it to do, it is to carry a variety of other Bills for the improvement of the law. The nature of these minor measures was disclosed by the ATTORNEY-GENERAL on the first night of the Session, when he asked for leave to bring in Bills to improve the jury system and to consolidate and amend the Law of Evidence. It is evident that the House of Commons is as ready to overwork and overtalk itself as ever. Sixty notices of motion were given on the first night, questions are to be asked on every conceivable subject, and the hobbies which private members disguise in the shape of Bills are innumerable. Mr. BRUCE is to take the dangerous question of the Rules of the Parks out of Mr. AYRTON'S hands, and possibly this may do something to mitigate the fierceness of the attack on Mr. AYRTON which is impending. Possibly the little tempest which Mr. AYRTON has roused may pass by, but what will be the character of the Session no one can say. It is certain that Parliament will do much less than it intends, and will do badly most of what it does; but whether the Session is to be a stormy one or not must mainly depend on the nature and reception of the Irish Education Bill.

ENGLAND AND GERMANY.

A DISCUSSION has lately been started as to the political and social relations of England and Germany, and some of the newspapers of both countries have been busy in explaining the reasons of the alienation of Englishmen and Germans which they assume to exist. The Germans have managed in an ingenious manner to connect the discussion with the Central Asia question, for they are pleased to suppose that the resolute attitude of England is in a great degree due to a wish on the part of Englishmen to show that they are not such poor creatures or so totally inferior to Germans as Germans might suppose. The air of unfriendly superiority thus assumed has led to remarks of corresponding unfriendliness on the part of English disputants, and at last the discussion got so warm that it was roundly asserted that Englishmen hate Germans, that Germans hate Englishmen, and that the main object of Prince BISMARCK'S foreign policy is to excite his countrymen to hate, despise, and thwart England. But an imaginary quarrel cannot always be kept at a white heat; and calmer observers have already begun to recall the disputants to the preliminary question, whether this hatred of which they are expounding the causes really exists. Englishmen can only speak for England, and no reasonable Englishman can doubt that there is no hatred whatever of Germans in England. No foreigners make themselves so much at home in England, are so freely welcomed, or are associated with the nation by so many family ties as Germans. But although there is no feeling against Germans in England, it may be said that there is a feeling here against Germans generally, and that this lack of sympathy is fully returned in Germany. To a certain small extent this is true. The Germans are very shrewd and keen in business, and there is some commercial jealousy of them. English travellers do not find travelling in Germany so pleasant as travelling in France or Switzerland, and they resent the arrogance and bluntness of German officials and their incessant attention to formalities. Many Englishmen are filled with pity for the victims of the war in Alsace and Lorraine who are made German subjects against their will; and others are frightened at the supposed aggressiveness of Germans, and believe that Germany is plotting to annex Holland, establish a navy that will rival ours, and found or purchase or conquer colonies that will be rivals and enemies of our colonies. The Germans are principally irritated against us because we furnished arms to France. With amusing candour they explain that they are not at all indignant with the Americans for doing exactly the same thing; and the reason they give is, that this is only what might have been expected of Americans, who do not affect high principles, but that England, to whom they long looked as a mirror of justice and high morality, might have been expected to lend no help whatever to a people like the French, who were waging a war monstrously and flagrantly unjust. Reasonable men in both countries talk differently, but it is the unreasonable people, the fussy traveller, the acute theorist with his warnings about Pondicherry and Java, the suffering parent or friend dwelling on the thought that the loved one died slain in France with an English bullet, who talk and use angry language, and will hear no reasoning that tells against them. From time to time such bursts of feeling will show themselves, but they soon pass by; for nations, except through the accidental follies of their rulers, are not guided in their substantial and permanent feelings by any but grave and deep considerations, and are not guided in their policy except by an attention to the large and abiding interests which they have to protect. As we think that the attractions of sentiment which unite Germans and Englishmen are of a very solid kind, and that the widest interests of the two nations are in many important respects identical, we do not much fear any breach of the friendship that unites them.

Religious and political similarities do not perhaps exercise so much influence in the world as they did in former times, but it is impossible to believe that this influence has died away, or is likely to die away, altogether. Germany and England have done and are doing so much for each other, and have so many points of religious and political sympathy, that they cannot be really hostile to each other, unless some very powerful dissolvent of their union should happen to be in operation. Germany gave us the Reformation, and England can never forget the debt. The two great Protestant Powers of Europe must necessarily have much in common. Nor do we fail in our generation to derive from Germany new fruits of the Reformation. The two great results of the Reformation were the adoption of the spirit of free inquiry in philosophy and religion, and the growth of physical science. At this hour quite as much as in the sixteenth century Germany is stimulating us in the path of free and laborious inquiry, and is devoting unwearied energy to the most minute and painful investigation of physical phenomena. Germany leads the van in the progress of lay as opposed to ecclesiastical education. On the other hand, England is rapidly teaching Germany the lessons of political freedom. It is to England that Germany looks as its mistress and model in free government, and it is only because Germany is not ready, although it is rapidly becoming ready for it, that Prince BISMARCK hesitates to introduce the English system of constitutional government into Germany. But this is not all. The two nations have a deep moral and intellectual kinship in another way. Both England and Germany, though with a distinct tendency towards liberty, have also a distinct tendency to conservatism, and have alike a fixed dread of anarchy. Both nations, although cherishing the spirit of free inquiry, have an abiding sense of the inextinguishable value of religion, and both have a strong tinge of unworldly enthusiasm. The epithets that describe the moral character of the one nation would with little alteration describe the moral character of the other. We should naturally speak of both nations as at once practical and poetical, earnest, grave, hard, domestic, charitable, reverent. Both are often unscrupulous, and both are prone to gushes of exuberant feeling. There are very few of the great interests of life which both do not substantially regard in the same way. War, for example, is looked upon very much in Germany as it is in England. Germany, like England, is ready to fight, and to fight hard, when occasion demands; but Germans hate war as much as Englishmen do. Neither nation has the military fever which has been the curse of modern France. It has been remarked over and over again that the conquerors of Sedan and Metz thought not of their victories, but of getting home. Neither nation has any scruple in appropriating the fruits of victory which it chooses to think too advantageous for it to forego. The Germans took and keep Alsace and Lorraine with the same imperturbable equanimity with which we took and keep Gibraltar and Malta. But neither nation likes to go to war for an idea, and neither nation can ever rid itself of the notion that to provoke war is to incur a terrible responsibility.

Still, however much the two nations may have in common, they may be stirred into wrath with each other by transient gusts of passion, and, however much their political interests may lie in the same direction, there might arise a divergence of interests, real or supposed, such as that which so nearly led to a rupture with regard to Denmark. But although we need not affect to think that Germany will always do as we could wish, always help us if we need help, or abstain from self-seeking and aggrandizement if too strongly tempted, it is nevertheless true that the interests of Germany and England are in the main the same. The only power in the Old World that we have to fear is Russia, and Germany is the only effectual ally against Russia that we could secure. If there is anything in Europe that we really wish to prevent, it is the absorption of Belgium by France, and the transfer to Russia of the command of the Danube. What we wish Germany wishes also, for the same reasons and with the same objects. This is the basis of our alliance with Germany—an alliance not very warm or demonstrative, but enduring, because it represents a permanent similarity of purpose. Each, too, needs the help of the other as far as the Eastern question goes. We can supply the fleet, and Germany the army, which a contest with Russia would need. Possibly for the present we better promote the substantial purposes of our alliance by not showing too much activity in each other's behalf. The Germans, for example, are often somewhat angry with us, because, in spite of the unjust war of 1870, we are very good friends with France, and have much sympathy with the misfortunes of that unhappy country. But in this we are really doing Germany a good turn. France is set, or thinks it is set, on a war of revenge. But the French know that a war of revenge would be madness unless some ally could be found to aid in carrying it to a successful issue, and the only possible ally that satisfies the necessary conditions is Russia. But a war in which France and Russia were arrayed against Germany would be so dangerous to the interests of England in the East that we could scarcely hope to keep out of it. The better friends we are with France, the more interests we have in common, the more intercourse and commerce bind Englishmen and Frenchmen together, the greater will be the indisposition of France to seek Russian aid in a war with Germany at the cost of forcing us to take the other side. Germany wants peace to be preserved, and England is always desirous that peace shall be preserved, and everything that England does to further the maintenance of peace is a gain to Germany. The imagination may of course be strained to invent situations in which the interests of Germany would run counter to those of England. It may be suggested that Germany will seize on Holland, that Germany will try to rival the English navy, that Germany will menace our Colonial Empire by founding one of her own. These are the merest vague possibilities. There is as little reason to believe that Germany would seize Holland as that it could all of a sudden invent a navy and colonies. To seize Holland simply because it might seem in some respects advantageous to do so would be as entirely opposed to the whole policy of Germany as to seize Egypt, which no doubt would be useful to us, would be opposed to English policy. Serious politicians cannot afford to wander in the path of vague surmises as to what would happen if a nation did something which it has apparently no intention of doing or got something which it has apparently no chance of getting. They must bear in mind only what is actual or reasonably probable, and if speculation is kept within this limit, the result of reflection can scarcely fail to be that Germany and England are too closely bound to each other by community of interest for momentary huffs and jealousies to keep them very far apart whenever the larger issues of European policy are raised.

MANCHESTER ANXIETIES.

THE discussion of the Manchester Chamber of Commerce at its annual meeting was not of a cheerful character. There have been many indications of an approaching decline or collapse of commercial prosperity, and it now appears that the staple trade of Lancashire is no longer in a flourishing condition. A rise of 120 per cent. in the cost of coal and of twenty per cent. in the cost of raw cotton forms a heavy deduction from the profits of the manufacture; and Mr HUGH MASON, President of the Chamber, denounced with passionate vehemence an agitation for a reduction of the hours of labour of women and children. Several of the speakers expressed a not unnatural feeling of irritation at the interference of strangers with the management of business with which they possess no technical acquaintance; and perhaps they may remember their own dislike to intruders when they are hereafter invited to sympathize with the supposed wrongs of the farmer or the agricultural labourer. Although it had been announced that the Chamber was studiously neutral in politics, Mr. JACOB BRIGHT in a purely political speech exhorted the Chamber to co-operate in the movement for the alteration of the tenure of land. Manchester manufacturers and merchants will be well advised in hesitating before they concur in disturbing any kind of property. The present agitation against landowners may, when it has accomplished its immediate object, be easily diverted into an attack upon capital; nor indeed are the leaders of the Trade Unions careful to conceal their designs on the property of the employers. In dealing with their own concerns the members of the Manchester Chamber of Commerce seem to be sounder economists than the South Wales ironmasters. The President admitted that a rise of wages in the cotton trade had been justified, not by an increase of the profits of the millowners, but by an extended demand for labour which had legitimately raised its price. The workmen in the cotton trade have not yet begun deliberately to restrict production in the hope of raising prices, and of consequently increasing profits to be divided between the manufacturer and the artisan; but in Manchester as elsewhere the relations between masters and men are unsettled and precarious.

The numerous protests which were uttered against the new Commercial Treaty with France were natural, just, and useless. It is perfectly true that M. THIERS's policy is retrograde and short-sighted, that a tax on raw materials is injurious to industry, and that the manufacturers of Rouen show no disposition to meet the English Free-traders in a spirit of reciprocity. It is vexatious that Frenchmen who to the utmost of their power exclude English cotton fabrics from their markets should have full liberty to buy cotton-wool at Liverpool, and to sell cotton goods in London; but all these matters are exclusively in the power of foreigners, except that it would be possible to practise retaliation, to the injury not only of the perverse French manufacturer, but of the innocent English consumer. As the Manchester Chamber of Commerce is not likely to recommend any return to the policy of Protection, it seems scarcely worth while to complain of the conduct of the French Government. One member of the Chamber regretted that the Treaty had been negotiated at the Foreign Office rather than at the Board of Trade; but it is difficult to understand what information or facility could have been commanded by Mr. FORTESCUE which has not been at the disposal of Lord GRANVILLE. The protective duties which are sanctioned and limited by the Treaty might have been imposed without limit or restriction if the English Government had refused to proceed with the negotiation; and probably the whole question is not regarded by the Lancashire millowners as one of primary importance. It would be desirable, if it were possible, to obtain free access for English cotton goods into France; but the competition of French fabrics in English markets is insignificant, and under Mr. COBDEN's Treaty the export trade of the district with France was comparatively trifling. English producers will probably find some compensation for the exclusive policy of France in the discouragement under a protective system of French fabrics in neutral markets. The scarcity and high price of raw cotton is a far more serious impediment to the prosperity of Lancashire than any obstructive tariff; but it may reasonably be doubted whether the admission of one or more Manchester manufacturers into the Indian Council would tend to increase the supply. It might perhaps be worth while to try the experiment, if it were distinctly understood that the permanence of the arrangement would depend on its practical result. There is reason to fear that Indian cotton is more likely to become dearer than to become cheaper. The rapid increase of manufacturing establishments on the banks of the Hooghly is not of good omen for the export trade of Lancashire, although the rising industry of India is at present employed on coarser substances than cotton.

Nearly all the members of the Chamber who took part in the discussion spoke with anxiety both of the agitation for a reduction of the hours of labour and of the high price of coal, which, according to one of the speakers, is equivalent to an extra halfpenny per pound in the price of cotton. The coal trade affords the most forcible and the most painful illustration of the tendency of high wages and short hours of labour to diminish production. In the Report for the second half-year of 1871 the Directors of the North Staffordshire Railway state that "the trade of North Stafford-"shire is most seriously affected by the diminished supply

"of coal. Although the price is excessive, and manufacturers "willing to pay it, the out-put of coal is so much lessened by "shorter hours of labour that potters and ironmasters are "working short time. . . . Coal, however, is now being "imported from other districts." The necessity for importing coal into a coal-field is a remarkable proof of the blessings which result from the reversal of the former relations between capital and labour. It is not surprising that manufacturers should feel but little enthusiasm in favour of projects for securing the working classes against the acts or defaults of employers. The Board of the Manchester Chamber of Commerce had proposed in their Report to petition Parliament for stringent clauses in the Masters and Servants Bill, for the purpose of ensuring the full payment in money of weekly wages. On a division the recommendation was rejected by the Chamber as an unnecessary interference with freedom of contract. By one of the proposed clauses employers were to have been prohibited from deducting from the wages any amount of rent which might be due. It may be presumed that there are plausible arguments for a suggestion proceeding from the directing Board of the Manchester Chamber; but, if the condition of workmen is such that they are entitled to exemption from the ordinary provisions of law, their advocates ought to understand that they have not established a charge of injustice when they have shown that workmen are in some respects subjected to special liabilities. Mr. CROMPTON has repeated, in an article in the *Fortnightly Review*, under the title "Class Legislation," the statements and arguments which he lately addressed to the Trade Unions' Congress at Leeds. He denounces as an intolerable grievance the provisions of the Masters and Servants Act by which breach of contract on the part of workmen is made punishable by imprisonment. The expediency and justice of any law are proper subjects of discussion; but the controversy is not settled by the allegation that the liability is not reciprocal. If the master improperly dismisses the workman, damages may be recovered by the injured party; but there is no use in bringing an action against a workman who has deserted his employment. Mr. CROMPTON indeed proposes "a juster law "for enforcing the payment of penalties against the poor"; but in many cases workmen, when they break their engagements, migrate to other districts; and the distress to which their families are reduced when labour is interrupted would generally render the recovery of penalties impossible. When the present law is put in force, only a few ringleaders are prosecuted; but the imposition of penalties, if it is to have any effect, must be indiscriminate and universal. If workmen require Truck Acts and Acts to enforce the payment of wages in money, they must be prepared for legislation to enforce their duties as well as their rights. One of Mr. CROMPTON'S proposals for the benefit of Trade Unions is that "no conspiracy to commit "an act for which a maximum penalty is already imposed by "statute shall subject any person to a greater or other "penalty than that which is so imposed." If Mr. CROMPTON means that the proposed enactment shall apply to all cases, it may be answered that a momentous change in the criminal law ought not to be introduced for the convenience of a single class which may be especially liable to engage in conspiracies. If, on the other hand, the provision is to affect only trade conspiracies, the proposal, whatever may be its merits, certainly partakes of the nature of class legislation. It is possible that the leaders of the Trade Unions may be mistaken in their belief that unlimited license, combined with exceptional privileges, would promote the interest of the workmen. The commercial and industrial greatness of England has grown up under conditions which the Trade Unions desire not to modify, but to subvert. It may well be that the profits which the workmen desire to share may be largely reduced, if not ultimately annihilated, by the destruction of industrial discipline and by the diminution of labour. In all quarters the disastrous consequences of the successful struggle of the colliers are causing distress and alarm. Sir WILLIAM ARMSTRONG at Newcastle and Messrs MINTON in Staffordshire show how the reduction in the supply of coal is sapping the foundations of the national prosperity by rendering production dearer or more difficult. The cotton workmen of Lancashire will perhaps soon be forced to recognize the injury to themselves which may be caused by the successful efforts of another class of workmen to reduce their hours of labour. It is no consolation to the general community to be assured that the coalowners have profited by the restriction of supplies which has been effected by the workmen.

FRANCE.

THE Committee of Thirty might lead a pleasant life if it were not for M. THIERS. They exercise for the time being all that constituent power of which the Assembly has shown itself so jealous. They are beyond the reach of furious debates, and in so small a body the majority can thoroughly realize that it is a majority. In the Assembly itself there is necessarily some uncertainty as to the result of even the best prepared division; but when there are only thirty members to be consulted, and twenty of them can be trusted to vote one way, there is a constant assurance of safety which must be inexpressibly soothing to storm-tost Conservatives. All would go well if they could only be dispensed from these terrible interviews with the PRESIDENT. He is externally polite and considerate; he expresses the utmost deference for the views of the Committee; he accepts with a few alterations here and there all the restrictions they wish to impose upon him; he is constantly protesting his desire to live in absolute agreement with them. But then these few alterations here and there have an unfortunate way of going to the very root of the matter. To be sure it is merely a question of introducing or omitting a word; only the word is always an important one. The draft comes out of M. THIERS's hands very little changed in form, but absolutely changed in substance. The interview on Monday was unusually bitter in this way. It seems probable that the Committee genuinely believed that M. BROËT's proposal would be accepted by the PRESIDENT. They had first, therefore, the annoyance of agreeing upon a compromise, and then the further annoyance of finding that their labour had been thrown away. Possibly M. THIERS feels his position in the Assembly stronger than it was a fortnight ago, and is consequently indisposed to submit to restrictions which, when M. BROËT's proposal was first talked of, he thought might not be intolerable. M. BROËT wished to save the dignity of the Committee by giving the Assembly a nominal right to refuse to hear the President, and as this right would have been exercised under the same terrible sanction as any other right which the Assembly claims against M. THIERS, it would certainly have been suffered to lie in abeyance. M. THIERS now declares in effect that even this appearance of restraint, this mere shadow of silence, is disagreeable to him, and accordingly he furnishes the Committee with a modified version of their Article on Interpellations. The draft of this modification, if it were set out in plain words, would be something of this sort. The President of the Republic communicates with the Assembly in writing; but he may communicate with it by word of mouth whenever, as often as, and on what subjects he pleases. The exception does not prove the rule; it is the rule. That which purports to be the rule is merely so much surplusage. It is as though the Committee had said in the first instance that M. THIERS must not call in person on the Assembly, but send in writing anything he wishes to say, and then in the next sentence had allowed him to call, provided that he always sends up his card instead of giving his name to the servant. Of course the form in which this is expressed is sufficiently decorous. The President is to be heard when the interpellations addressed to a Minister and the petitions addressed to the Assembly relate to foreign affairs, but not when they relate to home affairs. In the latter case each Minister will answer for himself. But if the Council of Ministers are of opinion that the questions raised relate to the general policy of the Government, and so involve the responsibility of the President, he is to be heard even upon home affairs. M. THIERS is willing to accept M. BROËT's amendment, provided that M. BROËT will recast it in this sense. Considering that the gist of that amendment, the one thing that gave it a right to exist, was the reservation to the Assembly of the decision when M. THIERS should be heard, and that M. THIERS now declares that he can only accept it on condition that the decision is transferred from the Assembly to the President, M. BROËT will perhaps not think it worth while to bestow any further trouble on it. M. THIERS is not now willing even to leave the Chamber as soon as he has spoken. He insists that he shall be allowed to remain till the debate is over, and to interpose such further corrections and explanations as he thinks necessary. After this clear enunciation of M. THIERS's views, the Committee will probably be anxious to bring their labours to an end as soon as possible. It seems to be understood that they have given up the idea of carrying the points at issue between them and M. THIERS before the Assembly. They know how certain the PRESIDENT is to have the advantage in that arena, and they wisely decline to court a useless defeat.

It appears from M. THIERS's speech at the sitting of the Committee on Wednesday that the Government is prepared with a scheme for the construction of a Second Chamber. M. THIERS's last theory on the subject is that the guarantees which are to secure the conservative character of this body are to be sought not so much in the electors as in the elected. The same persons who vote for the Assembly are to vote for the Second Chamber, but their choice is to be restricted to candidates who fulfil certain conditions. This combination of the ideas of an official Senate and a Representative Body is perhaps as likely to succeed as any other suggestion that could be made. The truth of the matter is that nobody in France except M. THIERS seems to believe in a Second Chamber, and that nobody quite knows why M. THIERS insists on believing in it. He has certainly taken pains that the members of it shall not be so distinguished as to overshadow the popular House. The electors, it seems, are to choose deputies who have been such for five years—after which time a man may be trusted not to wish to leave the Assembly, unless he has been more or less of a failure in it; members of former Assemblies—who have either failed to get re-elected, or have not felt confidence enough in themselves to try the experiment; Presidents of Tribunals and Chambers of Commerce—who rarely trouble themselves about politics; and men who have filled superior positions in public departments—and may therefore be trusted not rashly to oppose the Government for the time being. The elements of a distinguished Chamber do not seem to be forthcoming here in anything like dangerous abundance. A body so constituted may be of use in the practical business of legislation, but it will not have much chance of being listened to—perhaps it will rarely have time to speak—in those political convulsions in which the moderating influence of a Second Chamber is conventionally supposed to be valuable. The Committee is more really interested, no doubt, in modifying the law under which the First Chamber is elected than in providing a check to its action when elected. That some change will be made may be taken as certain, since M. THIERS has told the Committee that a new election cannot possibly be held with the law as it stands. The Radical journals are wonderfully constant in their support of the PRESIDENT, but they would hardly have declared themselves satisfied with this declaration if they had not felt assured that the alterations contemplated by the Government do not really effect any transfer of power. Nothing indeed can be more cautious than M. THIERS's own language upon this point. He frankly admits that he used to be very much afraid of universal suffrage, and he does not profess to have any very high opinion of it now. But the events which paved the way for the Empire have taught him that, if universal suffrage is a dangerous servant, it is a still more dangerous enemy. The law of the 31st May, 1851, put a weapon into the hands of NAPOLEON III. of which the authors of the Bill were the first to feel the force. If the Assembly had not reduced the number of the electors, it would have been difficult for the Prince PRESIDENT to put himself forward as the champion of universal suffrage against a factious and oligarchical minority. The fruit of the Assembly's policy was seen in the indifference with which the working-men of Paris at first regarded the *Coup d'état*, and in the ease with which a condonation of it was afterwards obtained. A Legislature which undertakes to restrict the suffrage confesses that it does not possess the confidence of a portion of the constituencies which in name it represents. Either this portion is an insignificant fraction of the electoral body, or it is an appreciable element of it. In the first case it can do but little mischief anywhere; in the latter case it will do more mischief outside the Assembly than it is ever likely to do inside. The recollection of the plébiscites still casts a certain halo round the memory of the Empire. Nothing would do so much to give this halo a revived radiance as a measure which should enable the Bonapartists to say that the Assembly, conscious of the Imperialist leanings of the French people, had tried to deny them the means of expression. Whatever reason educated politicians may have to distrust universal suffrage, they cannot do a less wise thing than seem to be afraid of it in a country where it has been in uninterrupted operation for two-and-twenty years.

THE LAST PROPOSAL OF THE EDUCATION LEAGUE.

A MEETING of the Education League in London just before the opening of Parliament may be considered as expressing the Secularist ultimatum. On this ground the resolutions adopted at Exeter Hall on Tuesday deserve careful examination. They set out the changes in the Education Act which the Government must propose if they do not wish to quarrel with the Nonconformist section of the Liberal party. These changes are the repeal of the 25th clause, the universal establishment of School Boards and of compulsory attendance at school, the abolition of school fees, and the application of public funds and local rates to the teaching of secular knowledge alone. Here is a perfectly consistent and intelligible programme. Let us consider what consequences are involved in the acceptance of it.

It may be well to say at starting that the proposals of the League are not in our judgment theoretically open to the objections on religious grounds which are usually brought against them. On the contrary, they might in their abstract form be accepted by the Denominationalists without any detriment whatever to the efficacy of Denominational teaching. The Church of England and every other religious body which cares to present the articles of its belief to the minds of young children would have substantially the same opportunities of doing so under the arrangement proposed by the League that it has now. The only difference would be that the zeal which the clergy now display in raising money to teach other things beside religion would then be altogether available for raising money to teach religion, and the effect would probably be seen in a fresh outburst of Denominational energy. If the League were given all that they ask, their Nonconformist supporters might before long regret that they had been so ill advised as to relieve the Denominationalists of so heavy a burden. If no other interests were at stake than those of contending educational theorists, the Secularists and the Denominationalists might safely be left to fight out their battle for themselves. If the Denominationalists won, they would keep what they have; if they were beaten, they would get more than they have. Either issue is one with which we should be perfectly well satisfied. But there are other interests at stake. The changes demanded by the League are too radical in their nature not to exercise a very decided influence for good or evil on the elementary education of the country. The repeal of the 25th clause of the Education Act, about which so much has been said, becomes a trifling matter when compared with the universal establishment of free schools. It has often been insisted that, if School Boards refuse to pay the fees of indigent children in attendance at Denominational schools, they must be prepared to build a school within reach of every such child. But if schools free to all comers are once set up, it will be impossible to stop anywhere short of building a school within reach of every child requiring elementary education. A free school for a few children chosen at random is an anomaly. The only means of insuring that no parent shall be forced to send his child to a Denominational school when he would prefer a secular school is to set up secular schools in sufficient numbers to take in the whole population falling within the school age. It is no wonder that, with such a design as this in his brain, Mr. DIXON should repudiate economy in education. He is ready to throw upon the community the whole cost of educating the children in elementary schools between the ages of five and thirteen. The money which is now derived from school fees, and the money which is now obtained from voluntary subscription, are to be alike sacrificed. The State, which now bears perhaps a third of the expense, is in future to bear the whole. Nor is it surprising that Mr. DIXON, having made up his mind so far, should further propose to throw a large proportion of this burden upon the Imperial revenues. It is his only chance of raising the money. To ask the ratepayers to educate every poor child in the country out of their own pockets would be tantamount to postponing the further consideration of the education question until after the people had been educated. Even as things stand now, with a great part of the work done by private energy, the difficulty of working the Education Act in country districts will often be very great. In many cases an unexpressed compromise has been arrived at by which the parson and the squire find most of the money, and in return have the control of the education given in the parish. It might not be difficult to disturb this settlement by stirring up the farmers to insist upon the control of the education being made over to them; but so far as they took up this cry, it would be under the influence of a hazy notion that the money would somehow go on being provided as usual. On the occasion of the rate-collector's next visit this little error would be set right, and the result of the correction would probably be seen in a bonfire crowned by Mr. DIXON's effigy, and in the return at the next School Board election of members deeply pledged to cut down the education rate. In theory of course the Education Department might make this

policy of no avail. It has ample powers to step in and do the work whenever the local authorities refuse to do it or do it inadequately. But it is one thing to take this course in a few flagrant instances, and quite another thing to take it as part of the regular working of the Education Act.

It argues a real advance in Mr. DIXON's knowledge of the subject that he should have discerned these difficulties in the way of paying for a system of universal free education out of the rates. Such progressive enlightenment gives ground for hope that when he has thought a little more he will see difficulties equally serious in the way of paying for it out of the Queen's taxes. A proposal to save an outlay from becoming unpopular by throwing it upon the Imperial revenue usually involves the assumption that the taxpayers will either not feel the additional burden, or will not distinguish the particular object for which it is imposed from the general mass of national expenditure. Within certain moderate limits this assumption is no doubt correct. This very question of education supplies an instance. Had the grant in aid of voluntary schools been raised by rates, it would never have gone on unchallenged for so many years. But it is impossible that such an outlay as that contemplated by Mr. DIXON should be kept within moderate limits. On the hypothesis that the burden would not be felt, there would be no check to its increase. Each district would understand that in proportion as it increased its school accommodation and raised its standard of education, it would be enabled to put its hand more deeply into the national pocket. A very few years of this process would raise the Education estimate to a sum which would entirely derange the customary calculations of the CHANCELLOR of the EXCHEQUER. Either some very large item of our present expenditure would have to be cut off, or the public revenue would have to be permanently increased. The first alternative is all but impossible. So long as the state of the world remains what it is, there can be no considerable diminution in the military and naval estimates, and all suggestions pointing to economy on a large scale almost invariably imply a saving in one or other of these directions. The second alternative would therefore have to be resorted to. An additional fourpence in the pound of Income-tax might meet the need, at all events for some time. But as soon as the taxpayer thoroughly comprehended that this additional strain had been put on solely to satisfy the crotchets of the Education League, he would become quite as restive under it as the ratepayer. Turn it what way you will, the question in the end comes to this—Is the country to be educated on the existing system, with the Denominations finding a large part of the cost in return for certain not very important concessions, and with the parents of the children educated finding another large part? Or is a bran new system to be substituted according to which both these sources of supply are to be closed, and the whole cost thrown on the community? In point of symmetry, and even of economy—meaning by economy the proportion between expenditure and results—the latter system may have the advantage. But it has one disadvantage which in the eyes of unprejudiced persons will more than counterbalance this superiority. If elementary education were thus handed over *en bloc* to the community, the chances are that Englishmen would remain uneducated.

Still in the interests of educational progress it is greatly to be desired that the present controversy should, if possible, be amicably settled. There is not much chance that the League will formally withdraw the demand which it has formulated after so much preparation. But it may be that the members individually are more open to reason than the members collectively. In the hope that this may be the case, we venture to offer one suggestion. There is an intelligible distinction between Denominational schools regarded as vehicles of secular instruction and Denominational schools regarded as vehicles of religious instruction. There can be no objection to additional precautions being taken to insure that public money shall only be given them in the former character, equivalent precautions being also taken to protect the freedom of the religious teaching. If this object is not already secured, by all means let it be secured. Any proposals of the League or its members which point in this direction deserve, and would be sure of receiving, the careful attention of the Government.

SPAIN.

IF King AMADEO and his infant heir survive for a few years, it seems possible that the dynasty may at last be established. The King has no need of dividing that he may govern, for the division is ready to his hand. In Spain even more than in France no faction will, except for some temporary intrigue, either coalesce with another or submit to the decision of the majority. A few weeks ago a serious danger threatened the existing Government through the declaration of the Duke of MONTPENSIER that he had waived his own pretensions to the Crown in favour of his nephew. Some of the principal personages in the State and the army, including TOPETE and SERRANO, have always supported the claims of the Duke of MONTPENSIER, while a large party adheres to the cause of the exiled QUEEN and her son. Although the Conservatives are powerless in the present Cortes, they had a large majority in the last, and their leaders possess much social and political influence. Fortunately for the Government, before the fusion could produce any practical result, it had already burst asunder. Under some provocation which is not clearly explained, the Duke of MONTPENSIER has withdrawn his allegiance from Don ALFONSO, on the pretext that the expulsion of the QUEEN was caused by her personal and political misconduct. If the fusion had at one time a real existence, it seems a capricious proceeding to declare that it is at an end on grounds which were equally valid when the two Pretenders thought fit to unite their interests. Any attempt which might have been made to patch up the quarrel has been rendered useless by a violent answer returned by the QUEEN. Her opinion is, not that she was dethroned by her own fault, but that she and her son were the victims of her brother-in-law's irregular ambition. It has always been believed that the Duke furnished pecuniary aid to the promoters of the Revolution of September; and he would probably have succeeded to supreme power, either as Regent or as King, if PRIM had not assumed the control of affairs and overruled the wishes of TOPETE and SERRANO. The irritation of the QUEEN, though excusable, is highly impolitic, inasmuch as the hostility or neutrality of the partisans of the Duke of MONTPENSIER might seriously affect her chance of success, if, in the conflict of parties, there were any opening for a BOURBON restoration. The Duke can scarcely be regarded as a competitor for a throne to which he has no hereditary claim. As a foreigner he is unpopular; and his reputed love of money has not tended to dissipate Spanish dislike. The utmost that he can do will be, with the aid of his personal followers, to impede or to further the pretensions of his nephew. Perhaps his motive for producing a rupture with the ex-QUEEN may have been a desire to release himself from the dangerous liability of conspiring in favour of a restoration. For the present he has rendered the only service in his power to King AMADEO, who perhaps shares with the Republicans the satisfaction of watching the squabbles of the hostile Royalist factions. It is possible that the birth of a son in the palace at Madrid may diminish the popular prejudice against an alien. A Republican orator lately drew an absurd comparison between King AMADEO and JOSEPH BONAPARTE, whose personal merits, as he said, never reconciled the country to the dominion of a Frenchman. It was not thought worth while to remark that JOSEPH's title was exclusively founded on the dictation of NAPOLEON, who had made himself temporarily master of Spain by a series of acts of unprecedented violence and perfidy. King AMADEO would never have set foot in Spain if he had not been invited by the representatives of the nation, who had a short time before been elected with the express mandate of selecting a prince to fill the vacant throne. The reasons against preferring Don ALFONSO or any other Spaniard were deemed by the Cortes conclusive, and it therefore only remained to look abroad for a King. By universal admission King AMADEO is personally superior to any of his rivals; and he may now perhaps profit by the accident which has made his infant son a native-born Spaniard.

The chronic insurrection of the Carlists in the Northern provinces has once more commenced. It is stated that the leaders rely on the unpopularity of the Government which has arisen from the recent enforcement of the legal conscription, and that they also rely on the embarrassment which may be occasioned by Republican disturbances in the great towns and in the South. It seems a mistake on their part to have waited till the late revolt of the extreme Republicans at Malaga and other places had been suppressed; but the Carlist bands seem to be unusually numerous, and they have in many places intercepted communication. San Sebastian, no longer a fortress, was thought to be in danger, though it is highly improbable that irregular troops would attempt permanently to occupy a peninsular position where their retreat might be cut off by an inferior force acting in concert with two or three vessels of war. There seems to be no doubt that in parts of Biscay, and of one or two other Northern provinces, there

prevails a feeling of attachment to the male line of the Bourbons, combined perhaps with a stronger distaste for modern innovations and new forms of government. That with the aid of irregular bands, commanded in many cases by warlike priests, the Duke of Madrid should establish himself on the throne of Spain seems to be wholly impossible; but his party is evidently strong enough to give much trouble to the Government at a time when there is elsewhere an extraordinary drain on its military resources. If the adherents of Isabella and Alfonso have any definite plans, they probably rely on the defection of a portion of the army rather than on a popular enthusiasm for their cause which has certainly no existence. In her letter to the Duke of Montpensier the Queen openly avows her determination to encourage any conspiracy or movement in her favour which may seem to offer a reasonable prospect of success. The partisans of her family at Madrid are scarcely more reticent; and they lose no opportunity of reminding the King by personal slights that they no longer recognize his title. The present Ministers exhibited excessive indulgence when one of their number boasted in the Cortes that any member was at liberty to declare his preference either for a rival dynasty or even for a Republic. Every Government ought, as long as it exists, to assume to itself a sort of divine right, by treating all dispute of its title as a political offence. The Duchess of Torre, wife of Marshal Serrano, lately refused to act as godmother to the infant Prince of Asturias, on the offensive ground that, belonging to a Creole family in Cuba, she could not countenance a Sovereign who menaced the institutions of her native island.

In the meantime Zorrilla's policy is consistent with prudence as well as with principle. In prosecuting his scheme of emancipation he has temporarily rallied the Republicans to his side; and it may be supposed that intelligent and patriotic Spaniards can appreciate the difference between a great and beneficent public measure and the wretched and selfish objects which are pursued by the various sections of the Opposition. In one of the most famous and most statesmanlike of his speeches Demosthenes reproved the Athenians for following, after the manner of an awkward boxer, every blow after it had been delivered by guarding the place against which it had been directed. Sound policy required that they should resolve beforehand on their political and strategical plans, and choose their own points of attack, instead of servilely following the movements of Philip. Although an Alfonsist lately asserted that by abolishing slavery in Porto Rico the Ministers were providing recruits for the Carlist forces, the true method of weakening the adversaries of the dynasty is to prove that the Government can be vigorous in legislation for the colonies even while it is harassed by factious disturbances at home. In spite of the clamour of partisans and the invectives of their journals, it can scarcely be doubted that the abolition of slavery will be popular in Spain, if only Zorrilla can remove the suspicion that he is acting under foreign dictation. There is reason to hope that Mr. Fish's characteristic diplomacy has failed in its effect through excess of astuteness. The publication of the despatch of October 29, which had never been presented at Madrid, was too transparent a contrivance. Mr. Banks, as Chairman of the Foreign Relations Committee in the House of Representatives, has for a similar purpose introduced a string of resolutions urging the President to interfere in various ways with the domestic administration of Cuba. Prudent Spanish politicians, instead of gratifying the hopes of their American advisers by angrily rejecting their counsels, will appreciate the necessity of depriving them of their latest pretext for coveting the possession of Cuba. The passage of the Emancipation Bill through the Cortes will be greatly facilitated by the announcement that the project has been favourably received in Porto Rico, where the slaves will probably be liberated during the present year. It is reported that even in Cuba the proprietors of slaves have begun to consider the expediency of immediate emancipation. They cannot but prefer a liberal compensation for the loss of their property to the total loss which has been suffered by their neighbours in the Southern States of the American Union. If their island were forcibly annexed, they would be inevitably exposed to the same fate; nor is it absolutely certain that they will be able to rely hereafter on just and liberal treatment at the hands of the Spanish Legislature. If the extreme Republicans were unfortunately even for a short time in the possession of the Government, fanatics who propose the wholesale expropriation of landowners and capitalists would not be disposed to offer compensation for the emancipation of slaves. Whatever may be the result of the present movement in Cuba, it is impossible that the colony should for any long time refuse to follow the example of Porto Rico. If Zorrilla succeeds in relieving Spain and the Colonies from a scandal which is at the same time a danger, he will deserve, and he will probably receive, the gratitude and esteem of his countrymen.

CANADA.

THERE is a curious infatuation which sometimes leads people to go out of their way to touch on subjects which for every reason had better be left alone. There is a well-known story of Charles Lamb visiting the relations of a lady on the day she was to be hanged. He had been expressly cautioned not to allude to the circumstance even in the most remote manner, and he was particularly anxious not to do so; but its magical influence was too strong for him, and in the midst of conversation he could not help suddenly looking at his watch and blurting out, "Ah, well, I suppose it is all over "with poor Miss Blandy now." Everybody must have noticed something of the same kind in private life; how people with the strongest personal reasons for avoiding particular topics are almost certain to rush straight at them as if impelled by an irresistible destiny. It is difficult to explain the recurrence of the *Times* to the question of Canadian independence except as an aberration of this sort. Anybody who happened to recollect that a few months ago the *Times*, in an odd fit of reckless and rather brutal cynicism, had published an article telling the Canadians that it would be well for them and for us to part company, and urging them to take measures accordingly, must have thought that, of all subjects in the world, this was about the last that the *Times* would be desirous of bringing into recollection. The article had been a three days' wonder. What was said about it on all hands showed plainly enough how little it reflected the actual opinion of the country, and it naturally excited surprise that such a prudent and circumspect journal as the *Times* should have been led astray in this manner. There was nothing very novel in the argument of the article; it had been heard in other quarters often enough before, and was remarkable only for the place where it appeared; like the fly in amber, it made one wonder how the devil it got there. In these days, however, the world moves fast, and even *Times'* articles are speedily forgotten. What evil spirit prompted the *Times* to rake up again this luckless article? Mr. Tennyson, it is true, in an ode to the Queen, had referred not very respectfully to "a strain to shame us" which had lately been heard concerning Canada:—

> "Keep you to yourselves;
> So loyal is too costly! Friends, your love
> Is but a burthen; loose the band and go."

But the Laureate mentioned no names, and there was no need for the *Times* to fit the cap on its head, and to cry "That's me." When a mistake has been made the best course is either to apologize promptly or allow the error to be forgotten. Unfortunately the *Times* not only revives the memory of its slip, but tries to justify it.

It is hardly worth while to inquire how far the account which the *Times* now gives of its opinions on the question accords with the strong language and painfully clear and obvious meaning of the incriminated article. It would have been well if the *Times* had been prepared, not merely to soften and qualify, but to retract altogether, the advice which it presumed to offer to the Canadians in the name of England. The *Times* assures us that all it has said, or intended to say, was that, as Canadian interests were not done justice to during the Anglo-American negotiations, it was time for the Canadians to look after their own interests for themselves. Canadian Ministers hang too much on the lips of English statesmen, and the Dominion suffers from complications from which it would be freed if it took up its independence. Therefore the *Times* repeats its former counsel:—"Take up your freedom; "your days of apprenticeship are over." "A Canadian" has answered these arguments in a very able and moderate letter. He challenges the statements of the writer of the article, and disputes his conclusions. It appears that the Canadians are under the impression that they already enjoy freedom, and they have a difficulty in understanding what is meant by apprenticeship. In the discussions between the Colonial and Home Governments in regard to tariff legislation, the negotiations with the Hudson's Bay Company, provisions for colonial self-defence, arrangements for coinage, registration of shipping, tonnage-tax on American fishing vessels, patents, copyright, and similar subjects, Canadian Ministers, so far from hanging servilely on the lips of English statesmen, have always struck out an independent line for themselves and adhered to it steadily.

The spiritless subserviency of Canadian Ministers is probably about the last complaint that is likely to be made against them by the Colonial Office. It cannot be denied that the refusal of compensation for the Fenian raids was an injustice to the Canadians; but the fault lay with the Americans, and not with the English Government. The question for the Canadians was whether they would refuse all the benefits of a settlement of disputes between the English and American Governments for the sake of a demand which they knew perfectly well the American Government could not or would not concede. In all negotiations there are points of greater and less importance, and statesmanship is shown, not in rigidly insisting upon every item, but in securing a balance of advantages. The desire of the English Government to dispose of the American claims was not a purely selfish desire. It was dictated quite as much by anxiety for the welfare of Canada as by any apprehensions of future danger to England; and the Canadians, on their part, were wise enough to see that their own interests were involved in a settlement just as much as ours. They felt, as "A Canadian" says, that they needed capital and population, and that they could not obtain them while these difficulties were impending; ten years of peace would consolidate their institutions, develop their resources, and double their population and national power. The interests of Canada required the establishment of friendly relations with a neighbour with whom she must have continual intercourse, and with whom she carried on a brisk and growing trade. For the sake of such an object, the waiving of an indemnity for the raids was after all a small affair. Apprenticeship, if it means anything, must mean the relations between an apprentice and his master, but it is absurd to talk as if Canada occupied this position in regard to England. A master orders about his apprentice as he chooses, gives his commands, and expects to find them obeyed. The stipulations of the Anglo-American Treaty were not imposed on Canada under the pressure of superior authority; they were submitted to her to be accepted or rejected as she chose, and she thought them worth accepting. The Canadian Parliament ratified the Treaty by a majority of 73 in a House of 177 members, and it is expected that in the new House of 200 members the Ministry which was responsible for the Treaty will have a majority of from 30 to 40.

It is difficult to understand why the *Times* should be so extremely anxious that the Canadians should part from us. The Canadians themselves know perfectly well that if they desire to go they have only to say so. Nobody supposes that we should go to war to compel them to remain with us. They are free to choose for themselves, to go or to stay as they think for the best; and there is no possibility of doubt as to the nature of their choice. The vehemence with which the *Times* argues with them that it would be so much better for them to be independent shows that they are still disposed to hold fast by the old ties, or of course there would be no need for these passionate appeals to them to go away. It is equally certain that there is no desire in this country for a separation. Indeed it is impossible to see why there should be such a desire on either side. Whatever may have been the origin of the union, it has now come to be a purely voluntary alliance, which adds to the greatness of the Empire without involving any serious sacrifices. Canada is practically a democratic Republic, without the nuisance of Presidential elections and the widespread corruption which they engender. She is not liable to be handed over every four years to the tender mercies of a fresh body of hungry and unscrupulous jobbers and place-hunters. The Canadians have an honest administration, an untainted judiciary, moderate taxation, and constitutional freedom in the fullest sense. How would they be likely to better their condition by throwing in their lot with the United States, or by starting, if that were practicable, which may be doubted, as an independent Republic? Would they be much happier if their railways were at any moment liable to be seized upon by Mr. JAY GOULD and the fraternity of Wall Street? But then, says the *Times*, the connexion with England exposes Canada to the risk of unpleasantness on the part of the United States. It might be answered that the Canadians are quite competent to take the measure of this risk, and that it is for them to say whether it is too much for them. The *Times*, however, answers itself. Canada, it says, is strong enough to hold her own ground; but in any case, even if she were independent, we should be bound to stand by her in the event of her being attacked by her powerful neighbour. Then what is to be gained by separation? If Canada is able to defend herself without our aid, she will be rather a strength than a weakness to the Empire; if, on the other hand, she happened to require assistance, we should not the less be bound to assist her because she had taken up her independence. What the *Times* has to say about Canada requiring the "education of self-reliance" would seem to be either nonsense or impertinence. Canada, as far as her domestic affairs are concerned, is a perfectly independent and self-governing community, as any Colonial Secretary who was rash enough to try the experiment of meddling with those affairs would quickly discover. It is true that Canada has not yet set up a foreign policy of her own, and perhaps this is what the *Times* means when it suggests that Canada should "teach something to her great neighbour," and should take up a position as a "great people." It is perhaps hardly worth while for Canada to embroil herself with her great neighbour by a course of spirited teaching, in order to oblige a crochetty journalist who seems anxious at all hazards to make mischief in this quarter. Perhaps the most important lesson that Canada can teach is that a people may be great by their high-minded simplicity of character, unassuming manliness, loyalty, integrity, respect for law, and personal honour, without striking an attitude and swaggering in the face of the world.

DR. HESSEL AND THE POLICE.

THE proceedings in connexion with the Great Coram Street murder bring out very clearly the defects of the present system of public prosecutions. The question is sometimes argued as if what was wanted was an increase in the number of public prosecutors. In reality the mischief is that, such as they are, there are at present rather too many of them. The administration of justice is blundered and thwarted, and made to look imbecile and ridiculous, by being left to a vast body of prosecutors, acting quite independently and irresponsibly, and, as a rule, with about as much fitness for their work as an elephant has for dancing on the tight-rope. This of course is quite of a piece with the silly shabbiness which characterizes our criminal system. Duties of the gravest kind are thrown upon ignorant and incompetent amateurs just because the Government will not pay for the services of competent agents. It will be seen at once that there are two things of the utmost importance in regard to public prosecutions—first, that they should not be lightly or rashly undertaken; and secondly, that, when once commenced, they should be carried on in a thoroughly efficient manner. In both respects the present system of prosecutions is deplorably at fault. It is notorious that a great many guilty persons are acquitted because the Treasury, with perverse and reckless parsimony, cuts down the costs of prosecutions; and on the other hand it would appear that an innocent person, against whom there is absolutely not a tittle of evidence, may be arrested and imprisoned for a week or more at the whim of a Superintendent of Police. Dr. HESSEL is a German clergyman, who was on his way, with his wife and a party of emigrants, to South America. The ship in which they were embarked ran on the Goodwin Sands, and had to put into Ramsgate for repairs. Dr. HESSEL and some of the other passengers took the opportunity of spending a few days in London. The suspicions of the police happened to fall on WOHLEBE, one of the emigrants, as having been concerned in the murder of the poor woman in Great Coram Street, for no reason apparently except that he was a German, and looked like one. He was arrested at Ramsgate, and witnesses were sent down to identify him. Dr. HESSEL proposed that a number of the other emigrants should put on rough coats and long boots such as WOHLEBE wore, and should be in the room with him when the witnesses came; and the chaplain himself set the example. It was a joke among them all. Mrs. HESSEL jested with her husband on the chance of his being picked out. The captain had his joke too, and there was a burst of laughter when the two witnesses, overlooking WOHLEBE altogether, singled out the chaplain. The chaplain smiled, and at once said, "I was sick in bed in London on Christmas-eve at "such an hotel; send there and you will hear all about me." It would have been the simplest and easiest thing in the world to ascertain the truth of this statement; but the police took no notice of it whatever. They carried off the chaplain to London, and charged him with murder; and he had to spend more than a week in prison before he had an opportunity of proving his innocence. He had no sooner produced his witnesses from the hotel than the magistrate said there was absolutely no case against him.

Of course it is monstrous that this should have happened. It would have been monstrous even if it had been only an accidental blunder; but unfortunately it is worse than that. There is really nothing accidental about it. The police seem

to have acted in the most deliberate manner, and the arrest of Dr. Hessel was only the natural and necessary result of the sort of way in which they are in the habit of going about their work in such cases. A murder had been committed, and the murderer was supposed to be a German, or at least a foreigner. "A man with a moustache and a dirty face," and with a rough voice—this seems to have been the nearest approach to a definite idea of his appearance which had been arrived at. We do not say that it was the fault of the police that they had no better clue to go by; but they might at least have been expected to understand how very slight a clue it was, and how little to be trusted to. However, there they were, watching the seaports and keeping a sharp look-out for foreigners with moustaches and dirty faces. If the police really thought themselves entitled to arrest anybody who happened to answer this description, they must be commended for their moderation in arresting only three or four. There seems to have been no other reason for seizing Wohlebe except his supposed resemblance to this vague portrait; and it was probably the merest chance in the world that the witnesses taken down to identify Wohlebe picked out the chaplain instead of one of the other emigrants. No doubt the police were bound after this to detain the chaplain until they had ascertained how and where he spent Christmas-eve; but there were several strong and obvious reasons which rendered it highly improbable that he should be the man. He was identified in a dress which he had put on in order to resemble Wohlebe, and which was not his usual dress, and it was a dress which it was most unlikely he would wear on a visit to London. He was a clergyman, lately married, and was accompanied by his wife. He had taken the lead in collecting a number of emigrants to stand with Wohlebe, and to be confronted with the witnesses; and, when singled out, he gave his explanations in the clearest and frankest manner. On the face of things it was in the highest degree improbable that Dr. Hessel should be the murderer, and inquiries at Knoll's Hotel would have at once removed any doubts on the subject. Why did the police not go to Knoll's Hotel? The answer, we fear, is painfully simple. They had got what they wanted—somebody to whom their scraps, or at least one of their scraps, of evidence applied, and whom they could put on trial. Carrying on a criminal investigation is dull work without a prisoner. It is like playing cards with a dummy; and the police appear to have looked at the matter quite as if it had been a game in which they were on one side and anybody they chose to fix upon as the accused represented the other side. There were two sides to the game, and as long as each side had fair play that was enough. The theory seems to have been that it was the business of the police to bring up all the evidence they could get against the prisoner. The defence was the prisoner's own affair, and they knew manners too well to meddle with it. There could hardly be a more striking example of the way in which the police apply themselves to investigations of this kind. They must start with a theory and work it out, and they find it easier to work it out if they concentrate their attention on all the evidence that seems to make for it, and shut their eyes to everything that suggests doubts or difficulties on the other side. They have the weakness of the ostrich family, and think that whatever they do not see with their heads buried deep in sand nobody else can see. Nature abhors a vacuum, and the moral nature of the police abhors the empty place where the accused person ought to be. Their great object seems to be to discover the guilty person of course if possible, but at all events to get somebody or other who can be put on trial. In this instance it never seems to have occurred to the police that they had themselves in the first instance a quasi-judicial function to perform before they decided on making a charge of the gravest kind, and that they were bound to weigh the explanations of the accused as well as their own evidence.

Within a short time there have been several brutal murders of women which have utterly baffled the police. There was the Eltham murder, in which a poor girl was found horribly mutilated in a country lane, and at the trial it came out that the police had kept back certain evidence because it did not exactly fit in with their case. Last July two women were murdered in a shop in the broad daylight in a frequented thoroughfare at Hoxton, but the police could find no clue to the murderer. And now there is this murder of Harriet Buswell. A year or two back there was a murder of a very similar character—that of Emma Jackson in Bloomsbury—and here too, though there were people in the next room and in the room below that in which the woman was killed, the police could find no trace of the murderer. The Road murder will occur to many persons as another instance in which the police, having allowed themselves to be carried away by a false theory, which never had much to support it, and which involved a great many difficult assumptions, utterly broke down. Publicity is the great snare of the police; they imagine that the eyes of the country are upon them, and that they are bound to show that they are extremely active and doing all they possibly can. Every little inspector and superintendent thinks it necessary to justify himself in the eyes of the world. It is not enough that his superiors should be satisfied; he must conduct his own case before the public. He assumes that he is on his trial, and that he has a right to show how clever and energetic he is. If he cannot catch the murderer, he thinks he has at least a right to show how he tried to catch him. Perhaps we can hardly be surprised that a coroner's jury should pass a vote of thanks to a police superintendent for an entertainment of this kind, prolonged over several weeks, and enlivened with racy, though utterly irrelevant, evidence raked up from the night-houses of London. It is difficult to understand how far a divisional superintendent in such a case is allowed to act entirely on his discretion, but it is pretty clear that all important cases should be taken up at head-quarters, and that every step should be guided by competent legal advice. Charges of murder against innocent persons are perhaps comparatively rare, but the police, we suspect, frequently trip into similar blunders in smaller matters. We have often thought that there should be a staff of magistrates or legal advisers some of whom should be always on duty to assist the police in determining whether charges should be taken up, as well as magistrates to hear the charges when publicly made. In any case it can hardly be doubted that the police are at present very weak from a legal point of view, and that the services of such a man as, say, Sir T. Henry, would be invaluable to the executive of the force as an adviser and director in difficult matters. It is of course very proper that Dr. Hessel should have compensation from the Government for the outrage of which he has been the victim; but it is not a pleasant reflection that if he had happened to be, not a countryman of Moltke and Bismarck, but a subject of Queen Victoria, he would have been unable to obtain any redress whatever. The hardships and indignities to which Dr. Hessel was subjected in prison have naturally directed attention to the manner in which prisoners awaiting trial are treated. It is of course obvious that prisoners must be kept in a prison, and that the arrangements of a prison must necessarily involve a good deal of discomfort and even hardship. But it is difficult to see why a man who is presumably innocent, not having yet been put on his trial, should be compelled to clean his boots and his mess tin, and wash and scrub the floor of his cell, and sweep down the walls, and do other menial offices; and the comfort of prisoners appears to be also much neglected in other respects. The worst of the hardships incidental to imprisonment is, however, a small thing compared with the hardship of being imprisoned at all, and hence the importance of guarding by every means against the arrest of persons on trivial and inadequate grounds.

FORCE IN LITERATURE.

A CURIOUS paper might be written on the singular errors made by men of high reputation in their critical judgments. Something of the kind was lately done in one of the magazines. Instances of such blunders abound since people first began to cultivate the art. When, for example, we read the critical sentences of the last century we are amazed at the inconceivable blindness which they seem to imply. Goldsmith, to take a case at random, was undoubtedly a man of fine taste; he tells us, *à propos* of Waller's ode on the death of Cromwell, that our poetry was not then "quite harmonized; so that this, which would now be looked upon as a slovenly sort of versification, was in the times in which it was written almost a prodigy of harmony." In the same place, after praising the harmony of the *Rape of the Lock*, he observes that the irregular measure at the opening of the *Allegro* and *Penseroso* "hurts our English ear." We can only wonder at the singular change of taste which induced our grandfathers to fancy that "harmony," of all things, was their strong point, and that Pope's mechanical monotony was to the exquisite versification of Spenser and Milton as Greek sculpture to the work of some self-taught mediæval carver. The same incapacity for perceiving what to us appear almost self-evident truths is as obvious in a wider kind of criticism. When Voltaire called Shakspeare "a drunken savage," it was a mere outbreak of spleen; but Voltaire in his sober moods, and he is followed in this by Horace Walpole, speaks still more contemptuously of one of the two or three men who can be put beside Shakspeare. He marvels at the dulness of people who can admire anything so "stupidly extravagant and barbarous" as the *Divina Commedia*. These monstrous misunderstandings are to be explained by the natural incapacity of

the subjects of one literary dynasty for judging of those of another. But the judgments of contemporaries on each other are not much more trustworthy. The long-continued contempt for Bunyan and Defoe was merely an expression of the ordinary feeling of the cultivated classes towards anything which was identified with Grub Street; but it is curious to observe the incapacity of such a man as Johnson to understand Gray or Sterne, and the contempt which Walpole expressed for Johnson and Goldsmith, whilst he sincerely believed that the poems of Mason were destined to immortality. Nor, again, can we flatter ourselves that this narrow vision was characteristic only of a school which has now decayed. We may find blunders at least equally palpable in the opinions expressed by the great poets at the beginning of this century. Such, for example, is the apparently sincere conviction of Byron that Rogers and Moore were the truest poets amongst his contemporaries; that Pope was the first of all English, if not of all existing, poets; and that Wordsworth was nothing but a namby-pamby driveller. The school of Wordsworth and Southey uttered judgments at least equally hasty in the opposite direction. Many odd instances of the degree in which prejudice can blind a man of genuine taste are to be found in the writings of their disciple, De Quincey. To mention no other, he speaks of "Mr. Goethe," as an immoral and second-rate author, who owes his reputation chiefly to the fact of his long life and his position at the Court of Weimar. With which we may compare Charles Lamb's decided preference of Marlowe's *Dr. Faustus* to Goethe's immortal *Faust*. Our grandchildren, it may be feared, will find equal reason for revising the judgments which now pass current amongst us. How, they will ask, could people be found to mistake the secondhand pedantry of —— (we leave the name to be supplied according to the taste of our readers) for genuine inspiration, or to overlook the productions of the immortal Smith and Brown, which were then read only by the unlearned or by some small circle of true believers?

If criticism should ever rise to the dignity of a science, such mistakes will be impossible. We shall discover some infallible gauge of literary merit, which will immediately detect lurking genius in the most improbable disguises. One of the axioms that will lie at the foundation of the future science will probably be expressed in some such formula as this, that the one real virtue is force, though it may appear in many manifestations. Mr. Herbert Spencer maintains that the laws of every phenomenon throughout the universe, including all spiritual and intellectual as well as physical phenomena, may be ultimately stated as corollaries from the primary laws of force. By applying the principle of the conservation of forces, we discover that the fall of a given weight through a given distance is equivalent to the development of a given quantity of heat. In like manner we should discover that the same force when converted into intellectual activity will generate a given quantity of poetry or philosophy. And, conversely, we may compare the merit of two literary productions by determining how much force was consumed in their production. If, for example, Shakspeare's brain did an amount of work equal to ten foot-pounds in composing the soliloquy of Hamlet, and Goethe's did an amount equal to five of the same units in composing Mignon's song in *Wilhelm Meister*, then the merit of the soliloquy is precisely double that of the song. We lay no particular stress on this theory, which has, as some people may fancy, a rather materialist sound, but it may serve as an illustration of our proposed principle. To compare the merits of any two writers, decide which exhibits the greater amount of force, and as a rule you may safely pronounce him to be the greater.

Thus the quality which chiefly serves to distinguish talent from genius is originality. The man who produces a new idea capable of germinating in the minds of his readers is so far a greater man than he who is merely the channel for transmitting ideas already expressed by some original thinker. This is the one great quality which distinguishes the few leaders of the world from the great mass of dealers in second-hand opinion; and it is due simply to an excess of power. Anybody can follow a beaten track, but to strike out a path for yourself involves an amount both of intellectual and moral force which falls only to the select few. Wherever it is found, we may say that its possessor is by birthright one of the immortals, though circumstances may stifle his powers of utterance; and every one knows what a strange influence he possesses even when his remarks, though original, have been anticipated by some one else. A man who speaks from his own mind is so far a new force, and therefore affects us in a manner essentially different from the ordinary writer, who can be considered merely as the surface upon which external forces have impinged, in order to rebound. Within the same class, again, it is easy to accept the theory that the merit of a writer is proportional to his vigour. The difficulty begins when we endeavour to compare writings differing in species as well as in merit. There are some writings in which force shows itself, as it were, naked, and is obviously the secret of the influence which they exert over us. Such, for example, is that masculine and nervous prose of which we have so many masters in English literature, and which sometimes looks so easy when it is really so difficult. The clear compressed reasoning of Hobbes, the manly common-sense of Locke, the incomparable energy of Swift, and the comparatively coarse dogmatizing of Cobbett have all a kind of family, or rather national, likeness; and, fortunately, we are not without some modern examples of the same style. Lovers of a more florid rhetoric are apt to despise the simple downright vernacular of the writers we have named, and even to fancy that it must be easy to express such plain thoughts in plain words. Nothing can in fact be further from the truth; because the quality which makes such writing possible is just that intensity of mind which belongs only to powerful natures. The direct expression of the thoughts of a feeble person is simply insipid. On the other hand, the gorgeous rhetoric of Burke or Milton or Jeremy Taylor is also good so far as it is a symptom of force taking a different direction. The energy which in one case displays itself by a strong grasp of a few leading principles displays itself in the other by overlaying them with a vast variety of illustrations and applications. The same amount of intellectual power may be displayed in Swift's attack upon Wood's copper coinage, and in Burke's on a regicide peace. Swift's power appears in the kind of bulldog tenacity with which he throttles his antagonists; and Burke's in the versatility with which he perplexes them by every conceivable mode of assault. To decide which is the greater, we must wait for that new calculus of the future which will enable us to estimate the total expenditure of force in either case. Hasty critics, as a rule, happen to find one variety of expression more congenial to them than the other, and fail to observe that it is a question, not of the essential power, but of the mode of application. In some cases a concentration, and in others a diffusion, of force may be most appropriate; and it is a great, though a very common, mistake to apply the same measure to all.

There is another variety of literature in which the principle does not seem to apply at first sight. Many of our poets, for example, appear to owe their success to a weakness rather than to strength. The more accurate statement, however, would appear to be that great strength of any one faculty is apt to throw a man off his balance. The very greatest men, the Dantes, Shakspeares, or Goethes, are men of thoroughly healthy and equable development. But the second-rate men, the Popes or Shelleys, are apt to be morbid because some of their talents are developed at the expense of the rest. Pope, for example, had, as Atterbury said, a *nervus curva in corpore curvo*. But his greatness was owing, not to the distortion, but to the marvellous quickness and keenness, of his intellect. He abounds in the most brilliant flashes of thought, but is unable to maintain a steady pressure. He is a poet therefore by fits and starts, and has composed innumerable couplets of wonderful merit, but scarcely one satisfactory poem. He is an example therefore of intermittent power; which is to the sustained power of healthier writers what a series of explosions by gunpowder is to the continuous expansion of steam. So Byron said of himself that he was like a tiger who would make but one spring, and if he failed went grumbling back to his den. The force is the same in all cases, but it may vary indefinitely in its mode of action. The morbid poets have an extraordinary sensitiveness to certain emotions and perceptions; and sensitiveness of all kinds is a symptom of an active intellect and of strength of feeling. The man who can perceive the most delicate variations of colour or temperature is not in ordinary parlance so strong as the man who can raise a hundredweight with his little finger. But he has a finer touch, a more delicate instrument in his physical organization. The value of his work will depend, not upon the degree of his perceptive faculty, but upon the strength of his feelings and his power of expressing them. The fineness of his organs determines what kind of materials he is to use; but the merit of the work depends entirely upon the vigour with which he turns them to account. The man of very delicate sensibility produces, it may be, a rarer variety of work: his fabrics are spun of gossamer instead of cotton; but though more interesting to the connoisseur, they do not possess more intrinsic excellence than those of the man of coarser organization but equal intellectual and emotional vigour. Shelley's poetry is more exquisite than Byron's, but it is not therefore more admirable.

Critics of young authors should therefore judge the performances of the novices by the energy they display. What is called good taste is generally a very questionable symptom in a young man: for it is too often symptomatic of a docility resulting from deficient vigour. The advice to a youth to cut out his finest passages was all very well with a view to the propitiation of ordinary critics and as a way of recommending vigorous self-discipline. But it is infinitely more important that there should be something to cut out than that the excision should be performed; and a superfluity of energy, whatever faults it may produce at starting, is the best of all symptoms. Unluckily faults of taste do not always or generally proceed from an excess, and may easily arise from a deficiency, of vigour.

RELIGION AND PATRIOTISM.

WE are not going to revive the controversy about the comparative loyalty of English Ultramontanes evoked by Archbishop Manning's recent deliverance at Sheffield. It is clear at a glance that the Archbishop's theory, even as modified by his subsequent explanations, leaves a very wide loophole for political disaffection; while, on the other hand, the criticisms upon it in the *Times* and the *Pall Mall Gazette* no less clearly imply that nobody who is not a Protestant, and a pretty advanced Protestant too, can be at heart a loyal Englishman. And this at once opens out an interesting inquiry quite independent of the merits or demerits of the Sheffield address or of the politics of English Catholics, on which we propose to offer some remarks. What are the relations of religious belief to loyalty

or patriotism? Are the two, when properly understood, in essential harmony, if not absolutely synonymous with each other, as the writer in the *Pall Mall Gazette* seems to suppose, or, if not, which has a right to claim precedence when they clash? Is every divergence of religious from national sentiment to be branded as disloyal, or is every one who subordinates religious to political considerations to be considered an indifferentist or a sceptic? It is obvious at first sight that, unless the spheres of political and religious life are not only separable in theory, which may at least be questioned, but are assumed in the teeth of all experience to be always kept separate in practice, collisions of the kind must occur from time to time whenever a nation is not all of one faith. Indeed it is quite conceivable that ecclesiastical and political interests might point in opposite directions, and thus divide popular opinion even in a country not rent by internal feuds of rival sects and Churches. The attempts of the Popes during the century after the Reformation to form a sort of Catholic League against the growing power of Protestantism were constantly foiled by the conflicting interests or jealousies of particular Catholic States. But we may confine ourselves here to the very common case of countries of divided religious belief, and ask whether it is or is not to be expected that the theological divergence will have any influence on political sentiment? Surely the question answers itself. So keenly was this difficulty felt when the religious unity of Western Europe was first broken up by the Reformation, that the notion of tolerating heresy—that is, of tolerating any other than the established faith—would have seemed to statesmen of all persuasions as absurd, to quote Sir James Mackintosh's language, as it would now be thought to propose the impunity of murder. Of course the prevalent conviction of the sinfulness of erroneous belief had something to do with this view; but politicians are seldom guided exclusively by abstract principles of right and wrong, and no European sovereign of that period doubted that the toleration of dissent would endanger not only his salvation, but his crown. A century and a half later, when the exigency of facts was compelling the adoption of a less rigid policy in several quarters, Louis XIV. deliberately sacrificed the commercial interests of France to the same theory by the revocation of the Edict of Nantes. Nor can it fairly be denied that there was a good deal to be said from a purely political point of view for this repressive system, though the rapid advance and consolidation of religious dissent ultimately rendered it abortive. The Catholics were a very disturbing element in the Government of England under Elizabeth, and the violence of the Huguenots almost threatened at one time to disintegrate the French monarchy. These, it may perhaps be urged, are extreme cases. But even so they are good illustrations of the principle. And if Catholics and Protestants have learnt since then to live peaceably side by side under the same rulers and the same laws, it is only because they have come practically, though not in words, to acquiesce in the existing lines of demarcation as a settled fact. But the acquiescence has its limits. Any fresh attempt to disturb the balance by throwing additional weight into either scale, as, for instance, by furthering the interests—or what are supposed to be the interests—of Protestantism in Italy, or of Catholicism in Ireland, is sure at once to provoke bitter jealousy, if not open resistance. Ultramontanes were inevitably out of harmony with the national sentiment about Cavour and Garibaldi, and a large section of English Protestants are fanatically hostile to any settlement of the University Education question which will satisfy the Catholics of Ireland. Thus much is obvious on the surface, but it may be worth while to look a little deeper into the matter.

We observed just now that it was only possible for religious and political loyalty to go always hand in hand where the nation was of one faith. We might have gone a step further, and added that this result would never be completely and universally secured except when a nation's faith is simply part and parcel of the national life. Under the Hebrew theocracy, and in the old Pagan States, this identity was realized. When the Prophet speaks of rebellion being "as the sin of witchcraft"—once a favourite text with the upholders of divine right of kings, though in fact Samuel was not speaking of civil insubordination at all—we must remember that for a Jew rebellion meant more than it can ever mean in any modern State. For him to defy the authority of Judges or Kings was to defy "the God of Israel." Church and State were not merely co-extensive, but identical; to be a bad citizen was to be a half-hearted believer, to disobey the law or betray the national cause was to be an apostate. And if, to use modern language, the political life of Judaism was a function of the ecclesiastical, Paganism arrived by an opposite method at a precisely similar result. The Gods of the Egyptians and the Amorites were opposed to the God of Israel. The Roman Empire, from which, according to Bishop Temple's once famous essay, we have inherited "the moral force and the moral sentiments which lie at the back of all political life," and especially "the duty of patriotism," was not indeed, like the Hebrew Commonwealth, a theocracy; but its religion, such as it was, was exclusively national, and was indissolubly bound up with the whole framework and the daily incidents of national life. To a citizen of Palestine or of ancient Rome there could be no temptation to a divided allegiance. To be loyal to their country was also to be loyal to their faith; in the one case because the entire civil and moral code was based on a divine revelation, in the other because the national religion was simply the expression and creature of the national mind and will. Christianity, among many new ideas, introduced into the world for the first time the startlingly novel principle of a universal religion which recognized no local limits and no rival claims. And it thereby introduced, for the first time, the possibility, which soon became the certainty, of a collision between political loyalty and religious faith. This conflict of duties was at once brought out in its extremest form under the Roman Empire. Not only did the early Christians find themselves necessarily and utterly out of sympathy with the whole tone of the heathen society around them, but they were in numberless instances compelled to choose between fidelity to their religion and obedience to the law. When Dr. Arnold says that they were persecuted, not because they might hereafter prove dangerous to the Empire, but because they broke its laws, he is suggesting a false antithesis; for their conduct soon made it evident that the whole social fabric of the Empire would be undermined if Christianity got the upper hand. Still it is quite true that they did disobey the law, and were obliged to do so if they remained faithful to their creed. The duty of submission to "the powers that be" was indeed peremptorily enjoined by St. Paul and by the Church after him, but then it was limited by the very important reserve of whatever trenched on the faith or moral standard of the Gospel. Christians were to obey the Emperor, but not to worship him; they were bound to fight, if called upon, in the Roman armies, but on no account to throw a grain of incense on the altars of the Roman Gods. And accordingly, as might have been expected, one of the first and most frequent charges against them was that of disloyalty to the State. In one sense it was perfectly true; in another it was false. They gave their lives for the State in battle, and, with certain indispensable reservations, they practised an absolute submission to its laws. But an unreserved submission they persistently refused, and their outward obedience was divorced from any inward sympathy. Their strongest convictions, their deepest feelings, their most cherished hopes and aims, were out of all accord with those of their Pagan fellow-subjects. And it was not long before the Pagans had the acuteness to perceive as much. If loyalty is the legitimate measure of religious belief, the early Christians were in the wrong.

It is always convenient to take a crucial example of a principle, and therefore we have dwelt on the position of the Christians under the Roman Empire. In modern States, where the contest is not between Christianity and heathenism, but between rival forms of Christianity, there cannot of course be the same fundamental antagonism of political and religious ideas. There is much in common after all in the theological belief, and still more in the moral standard, of Catholics and Protestants; the leading Christian ideas which were so abhorrent to the Pagan sentiment of the day are accepted by both alike. Yet the patriotism of a Christian whose religion is more than skin-deep can never be quite the same thing as the patriotism of a Roman or a Jew, and that for the simple reason that it cannot be an absorbing and exclusive passion. The love of country and the love of creed are consistent but not identical, and even when they harmonize they do not coalesce. The nearest approach to it occurs when circumstances have tended to identify the faith of a nation with the history of its greatness or its sufferings. Thus zeal for orthodoxy became a badge of Spanish patriotism after the long struggle, first with Arians, and then with Moors, and the Inquisition may be called an indigenous product of the soil. In like manner Catholicism has been branded into the national heart of Ireland and Poland by the sufferings they have endured from the enemies of their race and faith. But the coincidence in all these cases is accidental and temporary. In Spain the divorce of ecclesiastical and national sentiment is almost complete already, and the spread of Feniauism attested its commencement in Ireland. Protestantism, in the broad sense of the word, is an English tradition; but Protestantism itself has many subdivisions, and it only includes a considerable majority of the subjects of the British Crown. There is nothing as a rule to prevent the Roman Catholic minority from being equally zealous for the power and greatness of their country; still less would they feel any inducement to overt acts of disaffection. But so far as the national policy and character are moulded on Protestant ideas, they are disloyal in the same sense, though not in the same degree, as the early Christians were disloyal to the Empire of Rome. Nor is there anything in this peculiar to Roman Catholics. Unless the State exercises the absolute moral sovereignty which Dr. Arnold claimed for it, but which is incompatible with the existence of any independent religious organization, and is in fact a dream, there will always be room for this counter action of religious and patriotic sentiment. Thus, for instance, at the time of the Crimean War, putting aside the Peace Society and the Quakers—who might also in a sense be called disloyal—there was a small but very decided minority who, if they did not exactly side with Russia, felt no sympathy with the arms of England, and no pride in her victories. They would perhaps have admitted, or would not have cared to dispute, that it was our interest on political grounds to support Turkey, and to check the advance of Russian influence in the East. But they thought that the fact of the former being an infidel Power, while the latter represented a venerable and orthodox section of the Christian Church, should override all such considerations. Clearly they had a perfect right to maintain that view if they pleased, but it placed them in direct antagonism to the patriotic enthusiasm of the day, or, in other words, exposed them to the stigma of disloyalty. Many similar cases, often of more practical importance, will occur to any one who takes the trouble to look for them. Religion, when it is more than a name, is inevitably exact-

ing, and will not consent to take the second place. You may make patriotism into a religion to the exclusion of any rival claims, as was professedly done by the Romans of old, whose example has not unfrequently been followed without being professed in later days. But if any other religion be admitted, a potential limit is at once placed on political loyalty. In ninety-nine cases the right of dissent or resistance will lie dormant, but in the hundredth, where perhaps national feeling is peculiarly sensitive, it will peremptorily assert itself. And then either faith must be sacrificed to loyalty or loyalty to faith.

BALZAC'S MONSIEUR DE MORTSAUF.

IT may be interesting, at a time when the Legitimist party in France possesses more importance in the National Assembly than in the country generally, to study a Legitimist nobleman in Balzac. The portrait is not to be taken as a representative one in every sense, for Monsieur de Mortsauf has great faults of character, which belong to the man rather than to the Legitimist; but he has at the same time the marks of his party and his class, and the determination to regard everything from their peculiar point of view. This indeed is a habit common to all French parties, but it strikes one more in the Legitimists than in the others, because their principles are less capable of adaptation to the tendencies of the day. An Orleanist or a moderate Republican may be just as strongly convinced as any Legitimist can be that his own party is the sole possible salvation for the country; but Orleanists and Republicans, being more in harmony with the spirit of the present day, are not so much tempted to lay emphasis upon every detail of their political and social creed. The true Legitimist, who is always at the same time, if not religious, at least an ardent supporter of Catholicism, carries into his politics the uncompromising temper of his faith, and the disposition rather to harden than to obliterate the boundary lines between himself and the political heretics that surround him. It may be observed that the same temper or policy, if it is a policy, which has induced the Vatican to affirm with unprecedented energy the doctrines which most clearly separated it from modern principles, has its exact parallel in the disposition of the French Legitimists to make more and more evident the gulf that lies between them and every species of Liberalism. There is in both a certain *aigreur* natural to declining causes and to disappointed or unhopeful men. They have fallen upon evil days, and can but reiterate the expression of their fixed convictions to an age that is moving rapidly in quite a different direction.

The idea suggests itself as probable that, when Balzac drew his Legitimist nobleman, M. de Mortsauf, and made him a personage whose past life had been full of errors and imprudences for which he now endured the penalties, and which produced great morbid irritability, the novelist may have had in view something like a suggested parallel between the past of French Legitimacy and its present. And the children of M. de Mortsauf are represented as beings for whom in this world the chances of life are doubtful, owing to ancestral errors. This certainly reminds one of the effect of those royal vices which did so much to bring about the great Revolution and its endless chain of consequences. However this may be, the personal past of M. de Mortsauf enabled the novelist to paint a figure in perfect harmony with its situation:—

> I looked at the Count with an endeavour to guess his character, but was sufficiently interested by some dominant features to rest contented with a superficial examination of his physiognomy. He was only forty-five years old, but appeared nearly sixty, so rapidly had he aged in the great shipwreck which closed the eighteenth century. There was a half-circle of hair at the back of his bald head which ended about the ears, and came up to the temples in grey tufts mixed with black. Il is face bore a vague resemblance to that of a white wolf with blood about its muzzle, for the nose was inflamed like that of a man whose life is fundamentally disturbed, whose stomach is weakened, whose humours are vitiated by past diseases. His flat forehead, too broad for his face, which ended in a point, crossed by irregular wrinkles, announced the habits of a life in the open air, and not the fatigues of the mind—the weight of a permanent ill-fortune, and not the efforts made to overcome it. His cheeks, projecting and brown, in the midst of the ashy tones of his complexion, indicated a structure strong enough to assure him a long life. His eye, clear, yellow, and hard, fell on you like a ray of the wintry sun, luminous without heat, disturbed without thought, distrustful without an object. The mouth was violent and imperious, the chin was straight and long. Thin and tall, he had the bearing of a nobleman leaning on conventional values, who knows that he is superior to others by law, but inferior in fact. The liberty of a country life had made him neglect his exterior. His dress was that of a rustic in whom both peasants and neighbours respect only a landed estate. His brown sinewy hands showed that he wore gloves only to ride on horseback or on Sunday to go to mass. His feet were roughly shod. Although ten years of emigration and ten years of agriculture had had their effect upon his person, there remained in him some traces of nobility. The bitterest Liberal would have recognized his chivalrous loyalty, would have admired his religious conviction, his passionate devotion to his cause, his frankness in political antipathies. He was incapable of serving his party personally, but very capable of ruining it, and without any knowledge of affairs in France. The Count was one of those straightforward men who adapt themselves to nothing, and resolutely impede everything; ready to die at their post, yet stingy enough to give their life rather than their money. If he condemned himself, he refused to others the right to judge him. Bitter like a power which knows that it is in fault, but not having grandeur or charm enough to compensate the sum of pain which he had thrown into the balance, his private life probably betrayed asperities which one might guess from his angular features and his incessantly disquieted eyes.

M. de Mortsauf received as his guest the young gentleman by whom the story is told, and began to express his fixed opinions at the very opening of their acquaintance:—

> "Modern education is fatal to children," resumed the Count. "We stuff them with mathematics, we kill them with science, and use them up before their time. What a century this instruction of all classes is preparing for us if the evil is not forestalled by putting education into the hands of the religious corporations!"
>
> These words prepared me well for what he said one day at the elections, when he refused his vote to a man whose talents might be useful to the Royalist cause. "Je me défierai toujours des gens d'esprit."

How precisely this represents the same class at the present day, with its dread of public education in general, and its notion of making it safe—since public education there must needs be—by putting it into the hands of *les frères ignorantins!* Indeed, nothing is more curious in French society than the persistence of the pure Legitimist tradition on all points. It is not widely spread, but it remains perfectly intact in the small class which preserves it, and one of its most cherished convictions is the dislike of any popular education which is not directly under the control of the priests. The order, too, in which the ideas are expressed is carefully true to nature. The most genuine Legitimist does not eagerly desire even clerical public instruction in itself, but he thinks it may be useful to forestall that of the University.

M. de Mortsauf lived in the solitude of a mediocre fortune at his house of Clochegourde, in Touraine. He kept a family cabriolet and farmed his own land, which was not particularly extensive. This sort of country existence is not uncommon in France, and is as pleasant as need be when it is not poisoned by jealousy or pride. Unfortunately for M. de Mortsauf's peace of mind, he was as proud as a Legitimist Count well can be, and his sentiments of jealousy were kept in inflamed activity by the immediate neighbourhood of a château much larger than his own, surrounded by ample domains, and peopled by many servants. Jealousy, however, was not the only cause of his solitude. He was curiously ignorant, having received, indeed, the first half of a French nobleman's education, the superficial tutoring which was supposed to prepare a noble boyhood, but having from untoward circumstances unfortunately missed the second and more important education of the Court, the world, and high office. He had emigrated at the very time when this second education ought to have commenced, and instead of getting another to supply its place, had believed in the immediate re-establishment of the monarchy in France, and so passed his exile in the most fruitless idleness. On the dispersing of the army of Condé, in which he had given proofs of devoted courage, he had expected to return shortly under the white flag, and had not attempted to increase his means by industry of any kind. During these years his poverty had been of that most serious and extreme kind which a Frenchman calls *la misère*. His French gaiety had broken down under these ordeals; he had become morose, had fallen ill, and been nursed by charity in some German hospital. His disease had been an internal inflammation of a kind frequently mortal, and which often leaves, in those who escape from it with life, a strong disposition to hypochondria. After twelve years of exile he returned to France, permitted by a decree of Napoleon. His position contrasted painfully in everything with the promises of his infancy. He had been born rich, and in a rank to command a regiment or occupy some considerable post in the State; he had been born sound and robust. On his return to France, he found himself poor, ill, ignorant, and a nobody. Reaching at last the part of the country where his family property had been, he discovered that one farm had been kept for him by the farmer, who in the confusion that succeeded the Revolution had caused people to believe that he had purchased it from the Government. A great family in the neighbourhood, hearing of his return, had invited him to stay at their house till a habitation could be built for him on his own land, and a daughter of this family, Madlle. de Lenoncourt, became his wife. This young lady had an aunt, the Duchess de Verneuil, who made her a present of a country house called Clochegourde, so that the newly-married couple might have a home to go to.

In this quiet life M. de Mortsauf indulged at first in hopes of something like happiness, which however were rapidly blighted by the miserable health of his children and a constant anxiety as to the possibility of bringing them up. The care of his little recovered property, and the necessity for close attention to money matters, had gradually developed in his nature the germs of avarice. As his wife came to know him better, she was compelled to recognize the chilling truth that his character required from her the sacrifice of almost everything that makes life agreeable to a woman in the prime of life. His avarice imposed privations which she had to bear without a murmur, his suspicious disposition (he suspected everybody of trying to overreach him) required to be treated with the most watchful care, his morbid irritability needed soothing. She perceived that a temper like his was altogether unfitted for society, and so she lived with him in the solitude of Clochegourde, where he reigned absolutely, as he believed; but this absolutism was tempered by the feminine artifices of his wife, who made it her study to influence his capricious will, so far as it might be influenced for good. She succeeded in hiding his peculiarities from the world, and lived by his side the existence of a sister of charity who nurses some troublesome and thankless patient.

A visitor who knew M. de Mortsauf better than his neighbours thus describes him at this period of his life:—

> I found in this man an irascibility without cause, a promptitude of action in a desperate case which frightened me. Sometimes there were sudden returns of the *gentilhomme* who had been so brave in Condé's army, some

flashes of that decision which, in serious circumstances, can burst in the political world like bombshells, and which, by the chances of straightforwardness and contrast, change a man condemned to vegetate in his country-house into a D'Elbée, a Bonchamp, a Charette. In presence of certain suppositions his nose contracted, his forehead brightened, and his eyes emitted lightnings which were extinguished immediately afterwards.

The Count, like most idle men in the country, played a game to pass his evenings. His game was backgammon. His guest, at first ignorant of this scientific amusement, studied it in a learned treatise in a neighbour's library, and shortly became proficient enough to amuse his host, proficient enough even to irritate him:—

In a few days I found myself in a position to beat my master; but whenever I won his temper became execrable; his eyes flashed as if he had been a tiger, his face contracted, his eyebrows played like the eyebrows of nobody that I have ever seen. His complaints were those of a spoiled child. Sometimes he threw the dice away, put himself in a rage, hit his dice-box, and insulted me. These violences came to an end. When I began to play well I managed the battle as I liked, and arranged matters so that towards the close of the game the chances should be evenly balanced, letting him win during the first half and re-establishing the equilibrium during the second. The end of the world would have surprised the Count less than his pupil's rapid superiority—but he never admitted it. The uniform ending of our games gave him a new subject for reflection. "Decidedly," he said, "my poor head is soon wearied; you always gain upon me towards the end of the game, because then my abilities leave me."

This habit of playing at backgammon with his guest led M. de Mortsauf to betray himself on one occasion in a crisis of irritability of a kind which reduced his wife's existence to a perpetual exercise of patience. They had taken a walk with Madame de Mortsauf and the children on some heights in the neighbourhood of Clochegourde, and they arrived on a moor where nothing could grow. The earth was stony, dried up, without any covering of fertile soil; nevertheless there were a few oaks and bushes, but instead of grass there was a carpet of wild mosses on which the feet slipped. The Count struck this desolate, unproductive earth with his cane, and turning round suddenly said to his guest with horrible emphasis, "Voilà ma vie!" As this made his wife turn pale, he hastened to add, though too late, "Oh! mais avant de vous avoir connus."

M. de Mortsauf remained in the same gloomy and bitter state of mind till they got back to Clochegourde:—

We came back to Clochegourde talking *à bâtons rompus*. When we were in the drawing-room there was an indefinable uncertainty between us. The Count was plunged in an armchair absorbed in a contemplation which his wife took care not to disturb, for she knew the symptoms of the disease and how to forestall its attacks. I imitated her silence. If she did not ask me to go away, perhaps she thought that the game of backgammon would amuse the Count and dissipate the fatal nervous susceptibility whose outbursts were so trying to her. Nothing was more difficult than to induce the Count to play this game of backgammon, which he always eagerly desired. Like a *petite maîtresse* he liked to be entreated, compelled, so as not to have the air of incurring an obligation, probably because he knew that he did incur one. If after an interesting conversation I forgot for a while the expected importunities, he became quite out of humour, rude, saying things that hurt us, and showing his dissatisfaction by contradicting everything that was said. Warned by his ill-temper I proposed a game to him; then he began to coquet. "In the first place," he said, "it is too late, and then you don't care to play." Then he began to feign this thing or that, like women who end by deceiving you as to their real wishes. I humiliated myself, I supplicated him to practise me in a science so easily forgotten when discontinued. This time I had need of a wild gaiety to decide him to play. He complained of giddiness which prevented him from calculating, he said his skull seemed squeezed in a vice, he heard whistlings, he suffocated, and made prodigious sighs. At last he consented to sit down. Madame de Mortsauf left us to see the children put to bed, and have family prayers. All went on well during her absence. I arranged matters for M. de Mortsauf to win, and his luck soon produced a favourable alteration in his looks. The sudden transition from a sadness which had drawn from him sinister predictions about himself to this joy of a man intoxicated, this wild laughter, disquieted and chilled me. I had never seen him in an attack so plainly manifested. Our intimate acquaintance had produced its fruits, and he no longer treated me with ceremony. Each day he tried to include me in the circle of his tyranny, to ensure to himself a new pasturage for his ill-temper; for it really seems as if moral maladies were creatures having appetites and instincts, and which would increase the space of their empire as a proprietor would augment his estate. The Countess came down and approached the backgammon table to see her work better, but she sat at her embroidery-frame with ill-disguised apprehension. A most unfortunate move, which I could not hinder, changed the Count's expression. It had been gay, it became gloomy; the face had been red, it became yellow; the eyes vacillated. Then came a new misfortune that I could neither foresee nor repair. M. de Mortsauf himself brought about a cast which settled his fate. He immediately sprang to his feet, threw the table on me, the lamp to the ground, struck the *console* with his fist, and jumped about the drawing-room—I can hardly say that he walked. The torrent of insults, of imprecations, of incoherent phrases which poured out of his mouth would have made one believe the man possessed with a devil, as in the middle ages. I left the room, but he did not perceive it. From the terrace I heard the bursts of his voice coming from his chamber. Through the tempest I heard also the angel's voice, which at intervals rose like the song of a nightingale when the rain is about to cease.

The plain truth was that M. de Mortsauf went out of his mind occasionally, but his madness was mainly due to the absence of self-control in the ordinary habits of his life. Many men who are perfectly sane feel, in certain circumstances, that it would be decidedly a relief to swear hard and smash lamps or upset tables, but they refrain from doing it, partly because to act in that manner would have the effect of lowering them in the opinion of others, but especially because it would lower them in their own. M. de Mortsauf represents a class of men not confined to France, yet certainly, from the national character and the political history of the country, more common in France than elsewhere, who become bitter because circumstances have debarred them from the sort of career which in youth their prospects authorised them to expect. The blighting of expectations from great political vicissitudes has been common in France ever since the first Revolution, and active natures which cannot (or fancy they cannot, which amounts to the same thing), on account of their noble birth, find an outlet for their activity in trade, often grow bitter in some solitude like that of Clochegourde. In the case of M. de Mortsauf, Balzac united the different causes which usually tend most directly to produce bitterness. M. de Mortsauf had spoiled his health irretrievably by early excesses, his manly ambition was completely frustrated by the fall of the party to which he belonged, his fortune was gone, except just enough to allow him to vegetate in idleness, and he had no intellectual occupation to give dignity to his retirement and raise him in his own esteem. Under such circumstances, notwithstanding the beneficent influence of a charming and devoted wife, a man not endowed with much more self-control than is commonly found in Frenchmen would accumulate irritability, which from time to time would burst forth like the Icelandic geysers in sudden jets, hissing hot, and very noisy whilst they lasted. If it is madness, it is a sort of madness to which in circumstances equally trying we should most of us be greatly exposed. M. de Mortsauf had missed the most wholesome discipline of life, that of a worthy career, yet had suffered from life's hardest trials. Who can say what he might have been in times more propitious to men of his class and character? He had had dauntless courage, an unswerving loyalty, a firm faith, and his strong prejudices would have had all the effects of virtues in an earlier state of society. Speaking of his infirmities to their guest, his wife had a glimpse of that better life which might have been:—

Combien de maux a causés l'émigration! Combien de belles existences perdues! Il eut été, j'en suis certaine, un grand homme de guerre, l'honneur de son pays.

STONE ARCHITECTURE IN THE TENTH CENTURY.

IN the last number of the *Archæological Journal* Mr. J. H. Parker has again stirred up a very old controversy which we really thought had been pretty well settled. We had really thought that the notion that "the Saxons" could build nothing at all, or could build nothing but wood, was by this time sleeping quietly in the same limbo as so many other odd superstitions about the early ages of English history. We remember very well when, if any man hinted that King Harold and Earl Leofric could have found masons capable of putting stone and mortar together, he was at once told that, according to Bæda, the Saxons could do nothing better than build churches of logs of wood and cover them with thatch. When a stone church was by some odd chance built among them by a stranger, they wondered at it as something to which they were quite unaccustomed. To be sure when the man who heard all this turned to his Bæda, he found that Bæda was not talking about "Saxons" at all. The people who built the church of wood and covered it with thatch turned out to be Scots of the seventh century, and the people who wondered at the stone church turned out to be Strathclyde Britons of the sixth, and a very obstinate objector might perhaps murmur that these facts could not prove much as to the building powers of Englishmen in the eleventh. The people who argued in this way would have thought it very odd if a statement about the architecture of France in the time of Louis the Eleventh had been thought to be set aside by a statement about the architecture of England in the time of Edward the Confessor, because in such an argument as this the ordinary laws of time and space would have been felt to be of some account. But when it came to the "Saxons," considerations of this kind were no longer thought of. Among the barbarous people who lived in this island before the coming of William the Norman, a difference of four or five hundred years could not be of much importance. It mattered little when they lived, or whether they talked English, Welsh, or Irish, just as little as it mattered at what time they kept Easter, or in what way they shaved the heads of their priests. Nay, as a good many people have believed and put in print that William the Conqueror was sent over hither by Gregory the Great, it might even be thought that among such uncouth people as "Saxons" it could not make much difference whether they worshipped Christ or Wodon. But if any one had got so far in those distant times as to venture to hint at any of these little difficulties, he was at once made short work of by being told that the "Saxon" word for *to build* was *timbrian*. *Timbrian* must have something to do with *timber*, and a people who called building a thing *timbering* it were shown by the very evidence of their language to have built of wood and of nothing else. In those days perhaps few might have been found to answer that *timbrian* is cognate with *δόμος, domus, dominus, dame*—explaining perhaps that mysterious German word *frauenzimmer*—and the *domes* of St. Sophia and St. Paul's. It might have been answered that, if an English church of the tenth or eleventh century was proved to be of wood because it was said to be *timbered*, the minsters of Köln and Milan might be equally proved to be of wood because they were severally called the *Dom* and the *duomo*. Nobody then perhaps was sharp enough for this; but even then people sometimes ventured to hint that the meanings of words did sometimes change, that you could not always strictly infer the meaning of a word from its etymology; but, as they had sometimes heard of a white blackbird, as, in the technical language of architecture itself, they had sometimes heard of "plain Decorated" and "late Early English," so it did not seem absolutely impossible that, by the like caprice of language, a

stone building might be said to be *timbered*. We are talking of times, if not "sixty years since," at least thirty years since. Since then history, and architectural history as part of it, has been more scientifically studied. Professor Willis, to speak of only one name out of many, has, in his histories of Canterbury and Winchester, shown what great works were done in those churches in the tenth century by Odo and Æthelwald severally; and he has shown how at York it is not unlikely that some small fragments of the stone church of Eadwine and Paullinus still abide among the manifold changes of the crypt. The early history of England has been cleared from the darkness which hung over it, and the working of two little sums has thrown no small light on several matters. Instead of the popular belief that all "the Saxons" lived at the same time, a few minutes' handling of the Arabic figures showed that between Augustine and Harold as long a time passed as between Harold and Henry the Eighth, and that between Hengest and Harold as long a time passed as between Harold and Charles the Second. The history of Romanesque architecture has been studied with special care, and has been made perfectly intelligible. The so-called "Saxon style, instead of being looked on as a sort of unaccountable *lusus naturæ*, now takes its place as one variety of Primitive Romanesque, surviving from the days when all Western Europe drew its models from Italy. All this is now well understood. We had thought that the dream that "the Saxons" could build only in wood had gone after the kindred dream that "the Saxons" went naked and stained themselves with woad; we had thought that the belief that Beda and the verb *timbrian* could prove something about English architecture in the tenth or eleventh century had gone the way of the kindred belief that, when Caractacus and his family were brought before Claudius, the Emperor remarked that they were "non Angli sed angeli."

We were therefore a little surprised to find so distinguished an antiquary as Mr. Parker, the chief master of English mediæval domestic architecture, taking the opportunity of a description of the church of St. Mary at Guildford—a building containing some work of Primitive Romanesque—which he has just written in the *Archæological Journal*, to put forth views about this matter which we thought were dead and buried. We must surely, we thought, be listening to the people who went to the Alfred Millennary, or to the people who were so surprised at the *Tellsage* being called a myth, and not to a man of research like Mr. Parker, when we read in 1872 exactly the same sort of thing that we might have read in 1842. Speaking of the tower at Guildford Mr. Parker says:—

> I am aware that many well-informed persons consider the tower as of the time of King Alfred, and this involves the whole question whether the English people were in the habit of building in stone before the eleventh century. I have long since come to the conclusion that they were *not*, and I see no reason to change my opinion. The Anglo-Saxon for the word to build is *tymberen*, which implies that they were accustomed to build in wood only.

For *tymberen* we suppose we should read timbrian, and the *timbrian* argument we think we are pretty well done with already. It comes to much the same as if one were to argue that, among the people who used the mysterious wooden verb, every Ealdorman must have been a man of venerable years, and that no Thegn could have been anything more than a mere servant.

Mr. Parker then goes on to say:—

> I have never been able to find any remains that I could fairly place earlier than the first half of the eleventh century (with a very few exceptions, and excepting the remains of Roman work). Beda's account of the building of Benedict Biscop at Yarrow, and Monks' Wearmouth, in Northumberland, show that they were quite exceptional buildings *in the Roman manner*. The small remains that we have of them are just enough to show that the existing buildings are not of that period, but have been rebuilt in the time of William Rufus, as recorded in the "Durham Chronicle," published by the Surtees Society, and edited by the late Mr. Raine. The construction of the present buildings agrees with that period, and there are some small portions of the earlier building used as old materials and built in.

All this is a little amazing; every one knows that in 676 Benedict Biscop brought masons out of Gaul to build him a stone church after the Roman fashion. But it is rather leaping to a conclusion to make this prove that stone churches were exceptional for the whole time of more than three hundred years afterwards. To go no further, what does Mr. Parker make of the still earlier stone church at York which Eadwine began and which Oswald finished? What does he make of the building of Wilfrith at Ripon, which was of stone and something more?—"Basilica polito lapide a fundamentis in terra usque ad summum ædificata, variis columnis et porticibus suffulta." What about Ealdhelms church at Bradford, which is alive to speak for itself? Then about the churches of Benedict Biscop, we cannot guess where Mr. Parker has read their history. We do not know the *Durham Chronicle* edited by the late Mr. Raine; but we do know Simeon of Durham's History of the Church of Durham, which the Surtees Society is going to publish, but which as yet we have to study in the "Decem Scriptores." There will be found the whole account of the buildings reared by Eadwine, not under William Rufus, but under William the Conqueror, and of those buildings we have had occasion to speak in more than one topographical notice in our own columns. Instead of there merely being "some small portions" of the earlier building used as old materials, there are large portions of the work of 676, and other large portions of the work of 1074, the distinction between which is as plain as any distinction can be. But Mr. Parker is not satisfied with uprooting the earliest buildings of England; he goes on to uproot everything for the space of five hundred years throughout the whole world:—

> In the long interval between the years 500 and 1000 (in round numbers) it appears to have been the general custom in most parts of the world to build in wooden houses, and to use wood almost entirely for other buildings also. In the tenth century we are told by contemporary writers that it was the general belief of the people that the world would come to an end at the year 1000. This led them to erect temporary buildings only, but immediately after that year, when they believed that the world was to last another thousand years, they began vigorously to build in stone, and that very substantially, though rudely at first. There were no masons—no skilled workmen, the people had everything to learn from imitating the Roman buildings then remaining.

Mr. Parker's chronology is beyond us. "The long interval between 500 and 1000"—between Theodoric and Otto the Third—in which men "used wood almost entirely," takes in the building of St. Vital and most of the other buildings at Ravenna; it takes in St. Sophia itself, it takes in Romainmoutier and Lorsch and Aachen; it takes in the beginnings of St. Mark at Venice. These are, to say the least, somewhat important exceptions to the rule by which wood was used almost entirely. The notion that all the Kings, Popes, and Emperors from 500 to 1000 could find nobody to build anything in stone, and that after 1000 men began again to build in stone as a kind of newly recovered art, is about as amazing as anything we ever heard of. But it is almost more amazing when Mr. Parker, after complaining of the badness of the masonry during the first half of the eleventh century, adds,

> These early buildings were for the most part swept away by the Normans.

Mr. Parker in no way confines this sweeping process to England, Apulia, and Sicily. It would seem that through "most parts of the world" the Normans set forth on this errand of destruction. Once, during the reign of Henry the Fourth, "Willelmus Bostar, Rex Anglorum" was certainly looked for at Aachen. We must now suppose that he got there, and that he did a good deal of mischief on the road.

Mr. Parker's notions about the tenth century, as a time when, as he adds in a note, "the art of building in stone had almost died out, and all the other arts were at the lowest possible ebb," sound very funny to one who remembers that these were the times of the Saxon Emperors in the West, of the Macedonians in the East, and in our own land of Æthelstan the Glorious and Eadgar the Peaceful, and when the marriages of Edith and Theophano tied Europe together from Winchester to Constantinople. When Mr. Parker thinks that nothing could have been built, Dunstan was building at Glastonbury, Odo at Canterbury, Æthelwald at Winchester; it was the time of great works at Ely, Ramsey, Worcester, Wells, Fécamp, Beauvais, Koln, Soest, and Aachen—we simply write down names which occur to us without research—buildings many of which were doubtless swept away by the Normans, but which once existed all the same:—

> μόνον γὰρ αὐτὸς καὶ Ζεὺς στερίσκεται
> ἀγίνητα ποιῶν ὅσ' ἂν ᾖ πεπραγμένα.

The whole thing is a dream; the facts are all one way, but Mr. Parker has a theory another way. The only authority that he quotes is the well known passage of Rudolf Glaber, who does not say that nothing was built in the tenth century, but only that a great deal was built in the eleventh. He says that about the year 1003 people began to rebuild the churches, though the existing ones were very good, and did not need to be rebuilt. "Contigit in universo pene orbe, præcipue tamen in Italia et in Galliis, innovari ecclesiarum basilicas, licet plerasque decenter locatio minime indiguissent." His words show that it was a mere fashion, a change of style, a fancy for making things bigger; they quite upset the notion of stone building coming in as something new. Never was a passage more utterly turned away from its natural meaning to support a theory.

The facts of the case are perfectly plain. Buildings are built of such materials as are to be had. In a woody country, wood remains long in use; in a country rich in stone, stone soon supplants it. In Cnut's day a "minster of stone and lime" was remarkable in Essex; a "lignea basilica" was remarkable in Somerset. The like would have been the case long before and long after Cnut's day. Paullinus built a stone church at York; he built a wooden one at Campodunum. At Wilton a stone church supplanted a wooden one in the eleventh century; at Manchester the like happened in the fifteenth. Stone and wood have always been used side by side; but as woods are cleared, as skill increases, wood goes out of use and stone and brick take its place. Stone building never died out; it was not begun again as a new thing in the eleventh century, though the eleventh century was a time of a most remarkable development in point of architectural style.

We should not have gone into all this at length, had not the old dream turned up again in such a quarter as the *Archæological Journal* and in the hands of such a man as Mr. Parker. Mr. Parker in his own line, as the expounder of English manor houses, is hardly inferior to Mr. Clark as the expounder of English castles. But it is plain that he has not made any study of the general history of the world, or of the special history of architecture as part of it.

PROTESTANT PROPAGANDISM IN ROME.

THE bitterness of recent Papal Allocutions may be explained, if not excused, by an aggression which is as novel as it must be provoking, but for which the known zeal of British propagandists ought to have prepared us, if it had not prepared the Papal Court. It was hardly to be expected that, when the civil terrors of the ecclesiastical Government were once repressed, and its authority supplanted, the multiform emissaries of Exeter Hall would deny themselves the luxury of a free excursion into the long-forbidden domains of the Scarlet Woman. But perhaps only Protestant propagandism of a sanguine type ever ventured to anticipate the time when Exeter Hall should be morally transferred to the city of the Popes, and the Vatican itself echo the clamorous assaults of Little Bethel. Pius IX. has suffered many misfortunes and some affronts, but it may well be questioned whether any sorrow or humiliation is comparable to the infliction of witnessing, without the power of resistance or the right of protest, the petty aggressiveness of a Protestant clique within the walls of Rome. Yet it is to this complexion that things have now come. Middle-aged English gentlemen who have ceased to care for the tombs of the Via Appia or the ruins of the Forum, and middle-aged ladies who regard Rome in the same simple light in which it is regarded by Mr. Spurgeon—*i.e.* as the seat of St. Paul's preaching and suffering—hold their little councils together, and proceed to threaten the Papacy with their squeaking penny trumpets. Amid the rattling of tea-cups and the effusiveness of feminine chatter, pet missionaries recount the success of their onslaught on the votaries of the "Man of Sin." In such descriptions, it is needless to say, decency, courtesy, and taste are sacrificed to the exigencies of traditional invective. Moderation is treason to the cause of truth, and a tone of courtesy implies a paltering with the Mystery of Iniquity. The usual strain of anathematization is adopted, and provokes the usual quantity of self-complacency. In this country we know well the flavour of Evangelical rhetoric, but the novelty of its echoes under the walls of St. Peter's is startling, not only to those who remember the former *régime* of Rome, but also to those who have not forgotten the amenities of theological discussion among civilized nations. Last year witnessed a dispute which it was indeed strange to listen to in Rome; but neither the priests nor the Protestants who debated the question of St. Peter's visit to the Eternal City forgot the obligations of mutual civility and good breeding.

On the duty of maintaining even towards obdurate Papists a courteous and tolerant demeanour it would be useless for us to enlarge. But it is not superfluous to point out the impolicy of carrying the virulence of an ignorant Spurgeonism into the schools and lecture-rooms of Rome itself. The cause of Italian education, to say nothing of Italian conversion, is a very grave and interesting cause. It is impossible to exaggerate its importance or its difficulty. And just in proportion as it is difficult and important do the operations of the Protestant zealots seem to be unseasonable and ill-advised. We are not, indeed, aware that there is *prima facie* a special call for them to convert Roman Catholics at all. For, under all circumstances and in all places, the subversion of one kind of faith is more easy than the substitution of another. Many of those who yield a willing ear to Protestant ridicule or denunciation do so because they like to hear the Catholic religion laughed at, not because they desire to put Protestantism in its place. Of the Italian opponents of Romanism a far greater number are actuated by a hatred of all religion than by zeal for a pure religion; of the Italians who last year assembled in Rome to listen to the advocates of ecclesiastical reform, the majority were attracted by the hope of hearing priests and cardinals denounced. Nor would it be difficult to collect a large male audience, from a class far above the lowest, eager to hear the doctrine of supernaturalism derided and the worship of the Virgin scoffed at. But such an audience would have as little faith in the general scope of revelation as it has in modern miracles or the Immaculate Conception of the Virgin. It simply hates and despises the belief of the Catholic and the belief of the Protestant with equal intensity. Now it is such a class as this which listens with unfeigned pleasure, though not with unmixed sympathy, to the teaching of Protestant zealots. It hates priests, and it applauds the denunciation of priests. It disbelieves in the Divine Son, and therefore it scoffs at the Blessed Mother. It echoes the sneers at Papal infallibility, because it disbelieves in Popes, priests, apostles, and evangelists. Such disciples are hardly worth the breath which is spent in flattering their prejudices and their bigotry. But the declamation and the vituperation which tickle the ears of the Italian infidel deeply wound the religious sentiment of the Italian believer. He stands aghast and horrified at the ribald jest which assails the sanctity of the sacraments and the divinity of the Virgin. His whole life has been coloured, his every feeling permeated, by the influence of the supernatural and the unseen. From his infancy he has gazed upon the heavenly beauty of the Mother of the Lord, limned by reverential and cunning hands. He has seen her smile upon his prayers, and felt her protecting power in sickness and sorrow. To tell such a man that he has been worshipping idols, and that the object of his adoration was a mere ordinary woman, differing from other women only as being the accidental vehicle of a new revelation, is to outrage his religious feelings beyond all measure. And yet such is the strong food which the Protestant propagandist expects him to digest. The disgust of the pupil is in proportion to the harshness and crudity of the lesson taught.

Were the only results of Protestant propagandism to abet the infidel tendencies of one class of Italians and to irritate the religious susceptibilities of another, the obvious conclusion would be that the sooner it was discontinued the better. And this would be the true conclusion in this case, were it not for a certain other consideration which gives a wholly different character to the question. There does happen to exist among Italian Catholics a class of persons who, while professing loyal adherence to the general tenor of Catholic doctrine, are alienated from the Church by the mechanical formalism of its rites, the ignorance and irreverence of many of the priesthood, the hateful effects of a sacerdotal polity, and the utter want of spiritual religion among professed believers. These men, less rationalistic than German and less literal than English Protestants, wish to blend with the forms of their own Church some of the more thoughtful and spiritual principles of the Reformed Churches. They wish to diffuse among the people some knowledge of the books which embody the precepts and early history of Christianity, and to substitute for the superstitious acquiescence in existing worship a reasoning and reasonable religion. They wish also to have a higher standard of clerical character and attainment in the priesthood. These men, more common in Northern than in Southern Italy, and approximating more to Teutonic than to Southern sentiment, are possibly the germ of a renewed, if not a new, Catholic Church. If supported and strengthened, they may perhaps eventually do for the Roman Catholic religion that which it was at one time supposed that the Newmans, the Mannings, and other English converts might do, but which they have notoriously not done, in the way of correcting abuses, raising the tone of opinion, and crushing the corrupt formalism, or more corrupt power, of the priesthood. If they succeed in such an enterprise, they will prolong the existence of the Church centuries beyond the date at which it now seems likely to succumb to the forces of hostile scepticism and internal indifference. In such an enterprise they deserve the support of all serious and thoughtful men who believe that religion is not a mere sentimental luxury, and that nations cannot live without a faith. But this support will not come from the ranters of the Tabernacle or the blatant heralds of ultra-Protestant sectarianism. Humility and courtesy are as much as ever the accoutrements of the Christian ministry, and illiterate brawlers no more find now than they did in the days of St. Paul powers of persuasion and conversion in the license of rude and vulgar abuse.

It is to be hoped, then, that the new movement may yet find in its Protestant abettors wise and temperate auxiliaries. There is much to be done in Italy, and not least in Rome, for the education of the people. There are districts where the inhabitants are more savage than they were in the days of the Cæsars. There are districts within no long radius from Rome, wherein boys and girls grow up in a state of barbarism not very unlike that of an African village; and the province of Naples exhibits a condition infinitely worse than that of Rome. It is a grave and unpardonable scandal that an all-powerful Church, which numbered its ministers by tens of thousands, and possessed great social influence, should have allowed so large a portion of its members to vegetate for centuries in such horrible savagery; without belief, without reverence, without humanity, without honesty, without cleanliness, in the blindest ignorance and the most grovelling superstition. This state of things can be rectified only by the efforts of the Church itself; and no successful effort in this direction will be made until a new spirit has created a new organization within its pale. It is competent for earnest and laborious men of catholic sympathies to assist those who, inside the Romish Church, are anxious to reform its abuses and extend its beneficial influence. And, to enable them to do so, it is especially desirable that their efforts should not be cramped by perverse zeal and violence of temper or language. Should their efforts prove fruitless, it will indeed be a sad prospect for Italy. With more than half of her male urban population avowedly infidel, and the bulk of her rural population steeped in barbarous superstition, she will offer only too palpable facilities for the experimental tricks of Communists and Jacobins. With us an uprising of the infidel and anarchical classes would not be without danger in certain centres of population; but the trained intelligence and religious education of the middle and of a section of the lower classes would, together with the traditionary influence of the upper classes, reduce this danger to the narrowest limits. But in Italy, where the Church has lost its hold on the educated men of the upper and middle classes, where the monarchy is new and exotic, where the nobility has no political influence, where the masses are tainted with Mazzinism and scepticism, there are few elements of resistance strong enough to stay the downward impulse. One possible element of safety exists in the devotional tendencies innate in the Italian people. These, often insulted and outraged, and finally estranged, by the ignorance or presumption of priests or by the audacious pretensions of the Vatican, it would still be competent for the enlightened teachers of an uncorrupted faith to revive and enlist in a powerful defence of civilization, religion, and orderly government. But such an effect will not be produced by the prating of self-constituted apostles or the braying literalism of a presumptuous Spurgeonism.

SNOW IN LONDON.

IT is scarcely possible to conceive a more pitiable spectacle than that of a great city like London, with all the appliances of wealth and civilization at command, in a state of abject and miserable degradation and helplessness in consequence of a fall of snow. If snow were an utterly unknown and unprecedented phenomenon, one could perhaps understand it. If London woke one morning to find that an earthquake had shaken open a great gulf between Piccadilly and Charing Cross, or that an avalanche was thundering down Ludgate Hill and blocking up Fleet Street, there might be some reason for surprise and bewilderment. But most of us have a recollection of having seen snow once or twice in our lives. We have ourselves a notion that there are few years in which there is not at least one fall of snow. Yet whenever the snow comes, it seems to be always received as if it were something perfectly novel and never before heard of, and nobody knows what to do with it. Householders are required to clear away the snow from the pavement in front of their houses, and the police appear to be pretty sharp in keeping people up to their duty in this respect. The police can summon disobedient householders, but they have no power over the local authorities who are responsible for the roadways. The snow from the pavement is shovelled into the road, the carts and carriages churn their way through the middle of the highway, and huge banks of snow and mud are thrown up on each side, a terror to pedestrians, and, if they happen to freeze in the night, a danger to wheels. A good deal of snow fell on Sunday last, and all locomotion in the metropolis was almost instantly arrested. The omnibuses and tramways gave up at once, and by midday the cabs also had retired from the hopeless struggle. Next day the greater part of London was still impassable. No man who respected his horses would send them out to plough through the dismal quagmire of dirt and snow. Cabs made a desperate effort to get about with extra horses attached tandem-fashion, but double fares scarcely repaid the wear and tear of horseflesh and vehicles. Happily a quick thaw came to the rescue. If the snow had not melted away of its own accord, there is no saying when it would have been removed. Very likely we shall have some more snow, and if we do, we shall of course have a repetition of the same disgraceful incidents. The management of the roads is one of the darkest mysteries of local government. Important thoroughfares are blocked up for days and weeks, while a little handful of labourers dawdle, with frequent intervals for refreshment, over a bit of work that could easily be finished off, if undertaken in earnest and with a proper staff, in ten or twelve hours. Work of this kind should be done at night or in the early morning, and done as quickly as possible. But somehow contractors are omnipotent and vestries submissive. It would be interesting to know whether the contractors who are paid for cleansing the streets are exempted by a special clause from attempting to do anything in very wet or snowy weather. At ordinary times there is a certain show of doing something; but directly bad weather sets in, and the streets require special attention, they are fairly left to themselves. Day by day the mud or slush accumulates, the slough deepens, and the only hope of relief is a kindly shower. The contractors are evidently fair weather friends; in our time of greatest need no trace of them is to be found. No doubt the snow is a very troublesome thing to dispose of. A correspondent of the *Daily News* has gone into an alarming calculation as to the number of carts that would be required to carry off so many cubic feet of snow. To cart away every particle of snow would certainly be a formidable task; but there is an obvious difference between making a clean sweep of the snow and letting it alone. Even if it is impossible to get rid of it altogether, it might be within the scope of human effort to get rid of a little of it; and for small mercies in that way we should have reason to be thankful.

It is easy to grumble about these things, but it would be too much to expect that any amount of grumbling will bring about a reform. The local authorities are beyond the reach of criticism, and every year there is a monotonous repetition of the old scandals. The amount that is spent by private householders in sixpences and shillings for clearing the snow from the pavement in front of their dwellings would more than suffice, under proper management, to pay for clearing the roadway as well and carting the snow away. All that is wanted is a little organization. A heavy fall of snow produces simultaneously two results. It puts a stop to labour in one direction, and creates a demand for labour in another direction. A great many men, such as bricklayers, navvies, &c., are thrown out of work, just at the moment when the services of such men are wanted to clear away the accumulation of snow from the streets. The poor fellows would be glad of a job, and the public would be glad to incur a moderate expenditure in order to be relieved from an intolerable nuisance. All this has been pointed out over and over again. Every year the old homilies are preached, and it is shown that charity could hardly take a more useful form than the temporary employment of destitute labourers in this manner. Yet somehow nothing is ever done. Here are supply and demand side by side, as if made for each other, and yet there would seem to be no means of bringing them together. One of these days there may possibly be such a thing as a regular system of local government established in London, and it may be hoped that then this matter will receive attention. But all that needs to be done might be done at once by the existing bodies if they had a mind to do it. The town should be divided into districts of reasonable size, each under the charge of an official told off for the purpose. The workhouses would undertake to supply a certain contingent of able-bodied paupers, and if it were known that labourers out of work could obtain a job by putting down their names at the workhouses or the police stations, there would be certain at such a season to be no deficiency of hands. The different gangs would be told off to their work in a systematic manner, the routes they should follow having been carefully considered and decided beforehand; and by midday the town would be, if not absolutely clean, at least in a state of decent order. Part of the snow would be carted away, and the rest would be collected in little heaps at convenient intervals. The expense of the operation would be comparatively small, certainly not more than the separate payments of householders at present; the money thus spent would be a valuable boon to unemployed and destitute labourers; and the health and comfort of the population at large would be greatly promoted. Nothing could be simpler or easier than this; but of course it is much too simple and easy and obvious ever to be done, at any rate in our time. It has been observed that the continuous rains of last autumn and winter helped to cleanse the streets and to keep down the mortality. It might be thought that, for so important an object, London was rich enough to be able to afford a regular supply of water, independently of the rainfall. With the Thames at hand, it should not be very difficult to give London a good washing down every morning before the rush of traffic begins to pass over it. Asphalte streets, well watered, would reduce to a minimum the dissemination of dust and accumulations of dirt, as well as the irritating and wearisome noise of the rolling traffic. Now that Baron Haussmann is at leisure, it is a pity his experience cannot be turned to account in the English capital. The management of the chief thoroughfares of Paris in the Baron's time was certainly as nearly perfect as anything that can be imagined. The luxury of clean streets is one that London would find well worth paying for. As it is, a modern Gay might sing

> The toils, the perils of the wintery town,

and have no difficulty in obtaining materials for a second "Trivia."

The snow-fall of Sunday brought with it one rather startling result, which did not tend to restore the cheerfulness of the community. To turn from the dismal and depressing scene out of doors, the heaps of dirty snow, the slough of slush and mud, the staggering horses and shivering pedestrians, to the bright and clear fire, was a natural impulse with such as had fires to turn to; but the contemplation of the grate was deprived of much of its pleasantness by the sudden and tremendous rise in the price of coal. Eight shillings a ton is rather an alarming advance in a single day. Coals which not long ago were twenty shillings a ton are now forty-eight, and it is doubtful whether even this high price may not be exceeded. To some extent the increased cost of delivering coals when the ground is thick with snow justified a rise in price; but the principal reason was simply that the coal-owners had absolute command of the market, and could do as they liked. Snowy weather always produces a greater consumption of coal; and it was probably foreseen that an advance of prices, so far from checking the demand, would be likely to stimulate it, by creating a sort of panic, and frightening people into buying coals at once lest the price should go up still higher. There can be no doubt that the calculation was a sound one, and showed a shrewd knowledge of human nature. A moderate rise would have had little effect, but a jump of eight shillings all at once has fluttered the community, and filled it with vague fears of an approaching coal famine. There is of course a bitter outcry against the "extortions" of the coal-owners and dealers, and a demand has been raised for an official inquiry into the causes of the scarcity and dearness of coals. As far as the dealers are concerned, they are, we suspect, not altogether to be envied. These sudden changes of price disturb all their calculations, and make the trade risky and uncertain. It appears that it is not usual to keep large stocks of coal in London, and the dealers are therefore at the mercy of the owners, and are liable to suffer from unexpected fluctuations of price as well as their customers. The losses of the last week or so must, however, have been a small set-off against the large profits which the dealers have been previously making. The colliery owners, of course, are simply exercising their legal right to get the best price they can for their goods. They have a right to conduct their business in their own way, and it would be absurd to have an official investigation into circumstances the nature of which is sufficiently plain and obvious. The recent strikes have given the colliery proprietors a partial monopoly of the market supply of coal, as little is coming from the pits, and the market is fed mainly from stocks on hand. This limitation of the supply is for the moment akin to that which would be occasioned by an exhaustion of the coal measures. It seems to be not improbable that the disturbance of industry through the strikes of the miners will lead to the substitution of machinery for manual labour to a great extent in mining operations. A machine for coal-cutting, invented by Sir W. Armstrong, has had a year's practical trial, and is pronounced satisfactory. It will be more useful for the public to consider what it can do for itself in the way of economizing fuel than to expend its vexation in idle denunciations of any class of tradesmen. It is admitted that the ordinary English fireplace is wasteful and extravagant in the consumption of coal, but there is naturally a perplexing difference of opinion

as to the best kind of grate or stove to be substituted. And in any case a domestic revolution of this nature is not to be accomplished all at once. Even if householders could make up their minds what to do, only a small minority of them have power to carry out their wishes in the houses in which they live, and which usually belong, not to themselves, but to their landlords. The dearness of coal may possibly give an impulse to the manufacture of artificial fuel, in which coal-dust can be utilized with other materials. It is doubtful, however, whether there is anything more really economical than good coals, if carefully used in a fireplace of proper construction.

CRIMINAL LIABILITY FOR COLLISION.

THE Spanish Consul has appealed to the generosity of the English people, and has asked us to suspend our judgment upon the captain and crew of the *Murillo* until the facts of her alleged collision with the *Northfleet* have been thoroughly investigated. It might be answered that England will be generous in the expectation that Spain will be just. Let the truth be ascertained, and let the universal law of humanity be applied, and then not only England, but all the civilized world, which has an interest in this matter, will be satisfied. It may be remarked, however, that the circumstances to which the Spanish Consul has particularly adverted do not seem favourable to his clients. The "special features of the locality" are, or ought to be, tolerably familiar to all ships which frequent English ports. The *Northfleet* was anchored in a berth suitable for her size, and it is notorious that in such weather the roadstead in which she was lying is likely to be fully occupied. A ship which approaches a well-known anchorage at night is bound to use caution. It is like the act of letting off a gun at random, which would be harmless on an open common, but culpable in a crowded street. Undoubtedly circumstances combined to render the collision particularly disastrous, but it is therefore all the more to be lamented that the authors of the calamity did not do their utmost to mitigate it. If perfect order had prevailed, the boats of the *Northfleet* might have been utilized to their full capacity. But one of them pushed off in such a hurry that a plug-hole was left open in her bottom which nearly sunk her. The question asked last week as to the omission of signal guns has been answered. There was a gun on board, but the sponge stuck in it and the screw which should have extracted the sponge broke. But perhaps guns would have obtained no more attention than rockets. From various accidents the help which was not far distant did not come in time, but that is no excuse for the means of help which were actually on the spot being withdrawn.

In order to ascertain what may be reasonably expected from a foreign court of justice, it may be useful to inquire how our own courts would deal with such a case as that of the running down of the *Northfleet*. Now common sense and law agree in this, that there may be a culpable neglect of duty which would amount to what the law calls manslaughter. Thus a manager of a mine neglected to cause an "air-heading" to be put up, and an explosion of fire-damp occurred. The jury in that case were told that if they were satisfied that it was the plain and ordinary duty of the prisoner to have caused an air-heading to be made, and that a man using reasonable diligence would have done it, and that by the omission the death of the deceased occurred, they ought to find the prisoner guilty of manslaughter. In another case the prisoner was an engineer, and his duty was to manage a steam-engine employed for the purpose of drawing up miners from a coal-pit; and when the skip containing the men arrived at the pit's mouth his duty was to stop the revolution of the windlass, so that the men might get out. He deserted his post, leaving the engine in charge of an ignorant boy, who declared himself incompetent to manage it. The boy superintended the raising of two skips from the pit with success; but on the arrival at the pit's mouth of a third, he was unable to stop the engine, and, the skip being drawn over the pulleys, one of the men was thrown down the shaft of the pit and killed. Lord Campbell, who tried this case, declared his clear opinion that a man might, by neglect of duty, render himself liable to be convicted of manslaughter. In another case, the prisoner was a bankman at the top of a shaft of a colliery, where there was an engine and ropes to send down bricks and materials in a bucket. The buckets were run on a truck on to a movable stage over half of the area of the top of the shaft, and then the bucket was attached and lowered, the stage being removed. The prisoner had omitted to put the stage on the mouth of the shaft, and in the absence of the stage a bucket with a truck ran along the tramroad, fell down the shaft, and killed a man. The prisoner was found guilty of manslaughter. Lord Campbell said, "It was the duty of the prisoner to place the stage on the mouth of the shaft, and the death of the deceased was the direct consequence of the omission of the prisoner to perform his duty." In an earlier case it had been said that, in order to make the captain of a vessel guilty of manslaughter in causing a person to be drowned by running down a boat, proof of a mere omission on his part to do the whole of his duty is not sufficient. But there is no authority for the position that without an act of commission there can be no manslaughter; and, "on the contrary, the general doctrine seems well established that what constitutes murder being by design and malice prepense, constitutes manslaughter where arising from culpable negligence."

Cases decided forty years ago may not be trustworthy guides as to what would be held to be sound law at the present day. But it is useful to see how facts have been viewed by judges and juries, and therefore we will refer to the trial of a captain and pilot of a steamboat at the Old Bailey in the year 1835 for manslaughter of a person who was on board a smack by running the smack down. The running down was attributed to improper steerage of the steamboat, arising from there not being a man at the bow to keep a look-out at the time of the accident. It was proved that there was a man on the look-out when the vessel started, about an hour previous to the accident. According to one witness, the captain and pilot were both on the bridge between the paddle-boxes. According to another witness, the pilot was alone on a paddle-box. It was held that, under these circumstances, there was not such personal misconduct on the part of either the captain or the pilot as to make them guilty of felony. "It is difficult," said one of the judges, "to make felony out of a negligent act of omission, unless the party is bound by law to do the act omitted, as providing food for a child of tender years." This difficulty, as we have already shown, has been to a great extent surmounted by judges in more recent years. But still there is much force in the remark of the judges who tried the case to which we are referring. "Supposing," said one of them, "the captain had put a man at the bow and gone to lie down, and the man had walked away, do you mean to say the captain would be criminally responsible?" The collision occurred within an hour after the steamer started, but still the judges admitted that the captain might lawfully take repose. "A captain cannot be personally active himself for the whole twenty-four hours." It is not intended to suggest that a prosecution of the captain of the steamer which ran down the *Northfleet* would end as this prosecution did, but only to indicate the difficulties which are likely to arise.

Our knowledge of the circumstances of this collision is hardly sufficient to enable us to determine how far the principles above enunciated would be applicable. It was said at the Old Bailey nearly forty years ago, in a case to which reference has been already made, that if there be sufficient light, and the captain of a steamer is either at the helm or in a situation to be giving the command, and does that which causes the injury, he is guilty of manslaughter. There are cases in which the responsibility must either be divided between the captain and the pilot of a ship, or the whole of it must be transferred to the pilot under whose charge the ship has been placed. But we hear nothing of a pilot being on board the *Murillo*. The officer in command of her was a Spaniard, and it may be suspected that he was not thoroughly acquainted with the English coast. If he was on deck, and if the *Northfleet* carried her riding-light, as the witnesses say she did, it would be difficult to acquit him of that degree of culpable negligence which in law constitutes the crime of manslaughter. But it might turn out that he had gone below; and even if we assume that he ought to have been on deck, yet he could hardly be criminally responsible for that which happened in his absence. It is not like the case of the man who left a steam-engine in charge merely of a boy. The captain of a ship is clearly not bound to be always on deck. It is of course possible that criminal liability, if thus avoided by the captain, might devolve on somebody else. But we thus enter upon a wide inquiry. The matter which has affected the public mind is not so much the collision, which after all might turn out to be an example merely of gross carelessness involving civil liability, but the neglect of the offending ship to render assistance to the sufferers. There is a clause in the Merchant Shipping Act of 1862 which provides that, in case of collision between two ships, it shall be the duty of the person in charge of each ship to render to the other ship such assistance as may be practicable, and as may be necessary in order to save them from any danger caused by the collision. If the *Northfleet* had been run down by an English ship and left to her fate, the captain of that ship would have been liable to the modest penalty of losing his certificate. This apparently is all the punishment that could be inflicted on him by our law, and we could hardly complain on finding that the law of another country is not more severe. The breach of a statutory duty is generally a misdemeanour punishable by fine or imprisonment, but here the penalty of loss of certificate which is imposed appears to exclude any other. Parliament will probably consider whether some more severe punishment ought not to be appointed for any British captain who should imitate the conduct of the destroyer of the *Northfleet*. We ought at least to do as much ourselves as we expect from others.

IRRIGATION IN NORTHERN INDIA.

OUR surest title to Indian empire must rest in the willing acquiescence of the masses subject to us, and it will be the best safeguard against agitations fomented by our neighbours should we persuade the native races that they are distinct gainers by our rule. It is very likely that intelligent natives are better informed as to the progress of works of public utility in India than ordinary English politicians. Hindus and Mussulmans are keenly alive to all that goes on around them; Englishmen are inclined to fancy that things in Hindustan are very much as they used to be. The English in India were too long inactive in this direction. A merchants' Company based a policy of consistent aggression on extremely plausible pleas of self-defence. A series

of quarrels and their consequences were perpetually extending an elastic and ill-defined frontier line, and a Government that was generally at war had little time or thought or money to spare for the works of peace. We established order, to be sure, together with a system of justice which was an infinite improvement on any that had preceded it. So far the people found themselves in easier circumstances, and the increasing revenues which they were called upon to contribute pressed far more lightly on them than the larger exactions of earlier times. Yet Hindustan still preserved its old traditions, and, above all, its primitive methods of farming its scorched soil. There was wanton waste in the magnificent forests; teak and sahl trees which could not be replaced in the course of generations fell indiscriminately before the axe of the villager. Tanks that had been built by the munificence of Mogul Emperors, or by such of their more enlightened feudatories as lavished treasure beyond the precincts of the palace and zenana, were suffered to fall into disrepair. The ruin of the tanks, with the diminution of the rainfall consequent on the wholesale devastation of forests, seriously aggravated the scarcity of water which had always been the bane of India. The public works we had undertaken in our fighting days were undertaken mainly from a military point of view, and the country owed the vast improvement in its means of communication chiefly to strategical considerations. Latterly, however, the Government has taken wider views of its responsibilities; admitting that the prosperity of its subjects is indissolubly bound up with its own, it has committed itself to an enlightened policy of "permanent improvements." The forests have been placed in charge of regular commissioners, whose subordinates are carefully trained in schools of forestry formed upon German models. Above all, attention has been directed to economizing and regulating the water supply by the construction of works of canalization and irrigation on a grand scale; and the other day Colonel Greathed, chief engineer of irrigation to the North-Western provinces, read an exhaustive paper on the subject before the Institution of Civil Engineers.
